5. The combination of the support 1 with the arm carrying the arresting and releasing hook and the carrier-receiving trough or chute 42, substantially as described.

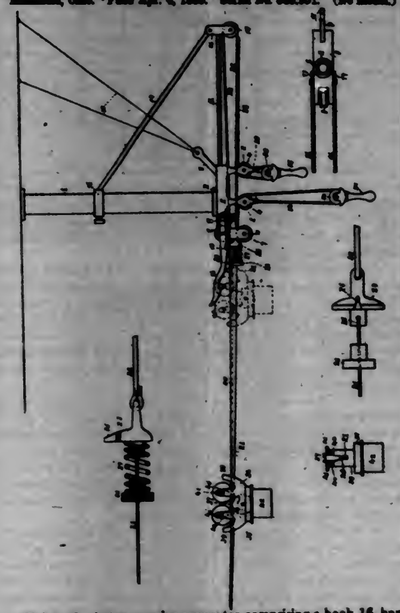
6. The combination of the support 1 and the return-track wire having a depression 10 with the carrier arresting and releasing device and the carrier-receiving trough or chute 42, substantially as described.

418,478. STORE-SERVICE APPARATUS. SAMUEL W. BARR, Mansfield, Ohio. Filed Apr. 4, 1889. Serial No. 305,950. (No model.)

Claim.—1. The combination of the cable-way consisting of troughs 2 and 3, having side openings 7 for the entrance and exit of the carrier-block, the bracket 9, secured to the bottom of the way and extending upward between the troughs, having an arm 10 projecting over a trough, and a switch-bar 11, secured to the arm for removing the carrier-block for the cable, formed with a downwardly and inwardly curved inner end 11^a, and with a downwardly-curved outer end 11^b, having a retaining-hook 11^c, substantially as described.

2. The combination of the cable-way consisting of troughs 2 and 3, rectangular in cross-section, having side openings 7, the cable 4, having plain thimbles 6, a carrier having pendent rectangular block 19 and hook 14, the bracket 9, secured to the bottom of the way and extending upward between the troughs, having an arm 10, projecting over a trough, and a switch-bar 11, secured to the arm for removing the carrier-block from the cable, substantially as described.

3. The combination of the cable-way consisting of troughs 2 and 3, rectangular in cross-section, having side openings 7, the cable 4, having plain thimbles 6, a carrier having pendent rectangular block 19 and hook 14, the bracket 9, secured to the bottom of the way and extending upward between the troughs, having an arm 10, projecting over a trough, and a switch-bar 11, secured to the arm, for removing the carrier-block from the cable, formed with a downwardly and inwardly curved inner end 11^a, and with a downwardly-curved outer end 11^b, having a retaining-hook 11^c, substantially as described.



4. The carrier constructed with a frame 12, the overhanging arm 13, and the rectangular block 19, depending from the arm, having a cable-opening 20, substantially as described.

5. The carrier constructed with a frame 12, the overhanging arm 13, and the rectangular block 19, depending from the arm, having a cable-opening 20, formed with widened portion 20^a at one side, substantially as described.

6. The carrier constructed with a frame 12, the upper horizontal overhanging arm 13, the rectangular block 19, depending from the arm, having a cable-opening 20, the lower horizontal arm 15, and the cash-box 16, substantially as described.

7. The carrier constructed with a frame 12, the upper horizontal overhanging arm 13, the rectangular block 19, depending from the arm, having a cable-opening 20, the lower horizontal arm 15, and the cash-box 16, having hinged front 17 and spring-catch 18, substantially as described.

418,479. STORE-SERVICE APPARATUS. SAMUEL W. BARR, Mansfield, Ohio. Filed Apr. 4, 1889. Serial No. 305,951. (No model.)

Claim.—1. A store-service apparatus comprising a hook 16, having a carrier-catch 18 and a bumper-recess 19, two track-wires, connection between the track-wires, and a bumper-head secured to a track-wire, and with which the hook engages, substantially as described.

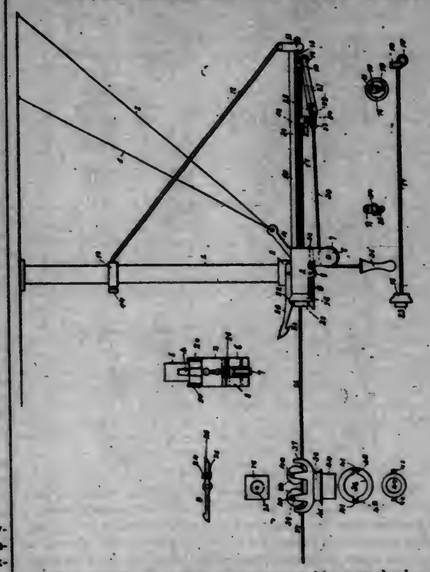
2. The combination of the upper track-wire 20, the lower track-wire 21, the connection 22 between the track-wires, and the bumper-head 23, having bumper 26 and coil-spring 27, substantially as described.

3. A store-service apparatus comprising a hook 16, having a carrier-catch 18 and a bumper-recess 19, two track-wires, connection between the track-wires, and bumper-head secured to the track-wire, having a notch 25 for the passage of the other track-wire, substantially as described.

4. The combination of the upper track-wire 20, the lower track-wire 21, the connection 22 between the track-wires, and the bumper-head 23, formed with a notch 25 for the passage of the upper wire, bumper 26, and coil-spring 27, substantially as described.

5. A store-service apparatus comprising a hook 16, having a carrier-catch 18 and a bumper-recess 19, two track-wires, connection between the track-wires, a bumper-head 23, secured to a track-wire, having bumper 26 and coil-spring 27, substantially as described.

6. The combination of the upper track-wire 20, the lower track-wire 21, the strap 22, connected to the upper track-wire, the bumper-head 23, by which the strap is connected to the lower track-wire, the bumper 26, sliding on the lower track-wire, and the coil-spring 27, connecting the bumper-head and bumper, substantially as described.



7. A store-service apparatus comprising a pair of hooks 16, having carrier-catches 18 and bumper-recesses 19, two track-wires, connection between the track-wires, a bumper-head secured to a track-wire, and a carrier comprising a frame 36, having side arms 40, provided with side projections 41, and bumper ends 39, substantially as described.

8. An apparatus comprising the upper track-wire 20, the lower track-wire 21, the strap connected to the track-wires, the block 2, having side pieces 3 and hangers 4, the hooks 16, having catches 18 and recesses 19, the bumper-head 23, the bumper 26, the coil-spring 27, and the carrier 36, having bumper ends 39 and side projections 41, substantially as described.

9. An apparatus comprising the block 2, having side pieces 3 and hangers 4, the rearwardly-projecting rod 11, the bracket 12, the pulleys 5, 6, and 7, the bracket-pulley 13, the upper track-wire 20, the lower track-wire 21, the connecting-strap 22, the pull-cords 28 and 32, and the bumper-head 23, substantially as described.

10. An apparatus comprising the block 2, having side pieces 3 and hangers 4, the rearwardly-projecting rod 11, the bracket 12, the pulleys 5, 6, and 7, the bracket-pulley 13, the track-wires 20 and 21, the connecting-strap 22, the pull-cords 28 and 32, the bumper-head 23, and the handles 31 and 34, having pulleys 30 and 33, respectively, substantially as described.

418,480. STORE-SERVICE APPARATUS. SAMUEL W. BARR, Mansfield, Ohio. Filed Apr. 4, 1889. Serial No. 305,952. (No model.)

Claim.—1. A store-service apparatus comprising a track-wire, a propelling-block slidable on the wire, having a rod supported on the wire, a catch-lever for retaining the block, and a spring for advancing the block, substantially as described.

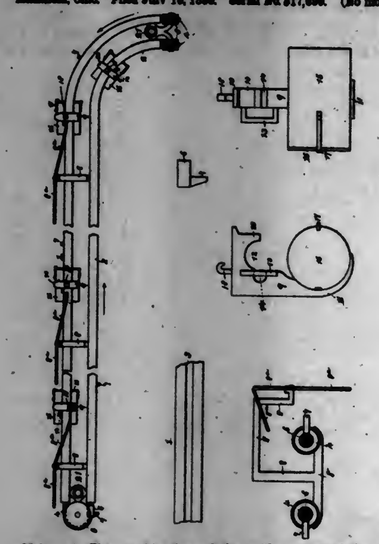
2. A store-service apparatus comprising a track-wire, a propelling-block slidable on the wire, having a rod, a loop or link slidable on the wire and supporting the rod, a catch-lever for retaining the block, and a spring for advancing the block, substantially as described.

3. A store-service apparatus comprising a track-wire, a propelling-block slidable on the wire, having a rod supported on the wire, a catch-lever for retaining the block, a finger for tripping the lever, and a spring for advancing the block, substantially as described.

4. A store-service apparatus comprising a track-wire, a propelling-block slidable on the wire, having a rod supported on the wire, a catch-lever for retaining the block, a trip-finger slidable on the rod for tripping the lever, and a spring for advancing the block, substantially as described.

5. A store-service apparatus comprising a track-wire, a propelling-block slidable on the wire, having a rod supported on the wire, a catch-lever for retaining the block, a finger for tripping the lever, a propelling-spring connected to the rod, and an operating-cord connected to the spring, substantially as described.

6. A store-service apparatus comprising a track-wire, a propelling-block slidable on the wire, having a rod, a loop or link slidable on the wire and supporting the rod, a catch-lever for retaining the block, a trip-finger slidable on the rod for tripping the lever, a propelling-spring connected to the rod, and an operating-cord connected to the finger and to the spring, substantially as described.



7. A store-service apparatus comprising the supporting-block, the track-wire, the propelling-block having a rod, the loop or link slidable on the wire and supporting the rod, the operating-cord, and the spring-connection between the rod and the operating-cord, substantially as described.

8. A store-service apparatus comprising a supporting-block, a rod extending rearwardly from the block, a cross-bar on the end of the rod, a track-wire passed through the block and secured to the

cross-bar, a propelling-block slidable on the wire, having a rod slidable in the supporting-block and supported on the wire, a catch-lever, a trip-finger, and a spring, substantially as described.

9. A store-service apparatus comprising the supporting-block, the track-wire, the propelling-block having a rod, the loop or link, the spring, the operating-cord, the catch-lever, the trip-finger, and the hooks having catches 21 and recesses 22, substantially as described.

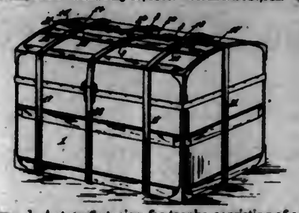
418,481. STORE-SERVICE APPARATUS. SAMUEL W. BARR, Mansfield, Ohio. Filed July 16, 1889. Serial No. 317,690. (No model.)

Claim.—1. The combination of the cable-way consisting of a pair of tubes 1 and 2, having continuous narrow openings or slits 3 in the sides thereof, a cable 4, provided with thimbles 6, having horizontal sprockets or projections 7 working through the openings or slits, and a carrier having a frame 9, provided with an overhanging arm 10, formed with a semicircular opening 12, conforming to the tubes to adapt the carrier to slide on the latter, substantially as described.

2. The combination of the cable-way consisting of a pair of tubes 1 and 2, having continuous narrow openings or slits 3 in the sides thereof, a cable 4, provided with thimbles 6, having horizontal sprockets or projections 7 working through the openings or slits, and a carrier formed with a frame 9, an overhanging arm 10, having semicircular opening 12, a groove or recess 14, and a loop or bar 13 in front of the groove or recess, substantially as described.

3. A carrier constructed with a frame 9, overhanging arm 10, opening 12, groove or recess 14, and loop or bar 13, substantially as described.

418,482. CULTIVATOR FOR BRICK-YARDS. ANDREW J. BATH, Summerdewt, Kans. Filed Mar. 25, 1889. Serial No. 304,613. (No model.)



Claim.—1. In a cultivator, the combination of a frame, standards secured to the frame, elongated points on said standards, and convex mold-boards secured to the standards above the points 6, by means of the clamps 8, substantially as described, and for the purpose set forth.

2. In a cultivator, the combination of the frame 1, cutting-wheels 11 12, uprights 19, journaled to the wheels, said uprights being provided with slots 20, and clamps 21, engaging in the slots 20, substantially as described, and for the purpose set forth.

3. In a cultivator, the combination of the frame 1, re-enforcing strap 2, cutting-wheels 11, 12, and 13, uprights 19, provided with slots 20, clamps 21, and notches 22 in the re-enforcing strap 2, in which the clamps rest, substantially as described, and for the purpose set forth.

418,488. STRAP-FASTENING FOR TRUNKS. WILLIAM W. BATE, Knoxville, Tenn. Filed July 15, 1889. Serial No. 317,512. (No model.)

Claim.—1. A strap-fastening for trunks, consisting of a cruciform top connection having an attached card-holder or name-plate and a buckle on the end of each of its four arms, the three parallel lateral straps 17 17 and 23 buckled to the cruciform top connection, and the longitudinal bottom straps 21 buckled to the lateral straps, substantially as shown and described.

2. In a strap-fastening, the combination of a cruciform top connection having one or more longitudinal extensions composed of straps 13 and 14, having cross-straps near the buckle end, of a bottom connection consisting of a ring having straps looped therein in four directions, said straps passed through their buckles and then connected to the buckles of the top connection, and straps looped through the side bars of the buckles on the longitudinal straps of the bottom connection, substantially as described.

3. In a strap-fastening, the combination, with a cruciform top connection composed of a four-branched attachment having buckles on each branch, of a four-branched bottom connection composed of four long straps looped through or otherwise connected with a central ring 19ª, and separate straps mounted with the side bars 25 of buckles 22 and their ends passed through their buckles and connected thereto and then attached to the buckles of the extensions of the cruciform attachment, substantially as described.

4. In a strap-fastening, the combination, with a cruciform connection consisting of two straps crossed centrally and united and having buckles at the four ends, of a card-holder mounted upon the same and connected permanently to three of the straps, said card-holder being composed of two plates or strips united at or near their edges upon the three sides connected to the straps, and having slots in the free ends of said plates engaging a fastening upon the fourth strap, substantially as described.

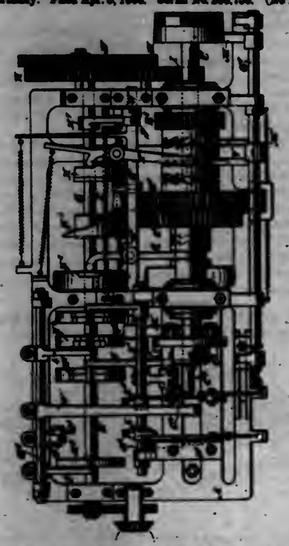
5. In a strap-fastening, the combination, with a cruciform top connection, of extensions 13 and 14, each having a strap 15, provided with buckles at both ends, a bottom connection composed of straps 19, connected with a central ring, and having buckles 22, provided with side bars 25, straps 17, connected with said side bars and having buckles 26, and central straps 23 connected with said ring at right angles to the longitudinal straps, substantially as described.

418,484. GAS-INCANDESCENT. HAROLD J. BELL, Gloucester City, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Dec. 19, 1888. Serial No. 294,039. (No model.)

Claim.—1. A gas-incandescent comprising an incombustible filamentous core and a covering of combustible fibrous material surrounding said core and saturated with a solution of the salts of the rarer metals which produce earthy oxides, substantially as described.

2. In a gas-incandescent, the combination, with a platinum wire, of textile material braided on said wire and saturated in a solution of the salts of the rarer metals which produce earthy oxides, substantially as described.

3. The combination, with a gas-burner, of supports placed adjacent to the burner and a cord or braid of fibrous material surrounding a core of refractory metal, substantially as described.



418,485. WHIRL FOR SPINNING-SPINDLES. JOHN BIRKENHEAD, Mansfield, Mass. Filed Jan. 19, 1889. Serial No. 296,897. (No model.)

Claim.—1. A whirl for spinning-spindles, having its band-groove formed of two concave concentric surfaces and two concentric and inclined surfaces, the latter surfaces being arranged between the former and joining each other in the middle of the groove, the junction of said inclined surfaces being nearer to the axis of the whirl than any other portion of said groove, substantially as shown and set forth.

2. A whirl for spinning-spindles, having its band-groove formed of two concentric concave surfaces and two concentric convex surfaces, the junction of the latter with each other being in the middle of the groove and nearer to the axis of the whirl than any other portion of the said groove, substantially as shown and set forth.

418,486. WOOD-SCREW MACHINE. MARTIN BRUSSY, Schwelm, Prussia, Germany. Filed Apr. 6, 1889. Serial No. 306,700. (No model.)

Claim.—1. In a screw-cutting machine, the combination of a sleeve B, a spindle C, having a flanged socket C^3, and adapted to turn with and slide in the sleeve, a screw driver or holder C^4, the sliding rod G', having a fork engaging the flanged socket, and the shaft G, having cam-disks H' and H' for moving the rod lengthwise, substantially as described.

2. The combination of the sleeve B, the spindle C, having a screw driver or holder C^4, the cam-shaft G, having a cam-disk H^3, the driving-shaft E, the change-wheels, the three chains of intermediate gearing between the sleeve and driving-shaft, the clutch on the driving-shaft, the clutch-lever Q, actuated by the cam-disk, the double clutch on the sleeve, the cam H, and the lever P, substantially as described.

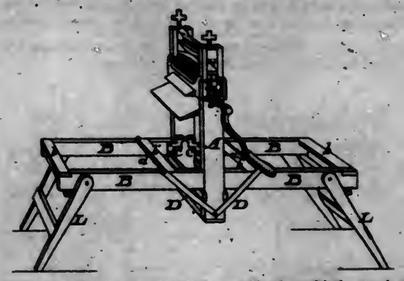
3. The combination of the sleeve B, the spindle C, turning with and adapted to slide in the sleeve, the driving-shaft E, the three chains of intermediate gearing between the sleeve and driving-shaft, the clutch on the driving-shaft, the double clutch on the sleeve, the levers Q and P, and cam-disks H^3 and A, substantially as described.

4. The combination of the sleeve B, the spindle C, turning with and sliding in the sleeve and having the grooved disk C', the screw driver or holder C^4, the lengthwise-movable shaft G^2, the spring T, the lever M on the shaft engaging the grooved disk, the double clutch on the sleeve, the slide V for disengaging the clutch, and the lever M' on the shaft for operating the slide, substantially as described.

5. The combination of the sleeve B, having the gear Z, the spindle C, turning with and adapted to slide lengthwise in the sleeve and having a screw driver or holder C^4, the driving-shaft E, having the gear Z, the intermediate gear Z^{xx}, a clutch on the driving-shaft to engage and disengage its gear Z, the change-wheels, the shaft G, the double clutch on the sleeve, the gears Z^2 Z^3 Z^{xx}, the gears Z^4 Z^5, the levers Q and P, and the cam-disks H^3 and H, substantially as described.

6. The combination, with the rising and falling grippers, of the pivoted levers or arms L^2 L^4, the slide L^7, the rock-shaft G', having the lever L engaging the slide and provided with the lever 3, the cam-disk H^5 for actuating the latter, the pivoted lever or arm L^4, the lever L^3, extending from the rock-shaft, and the rods l^2 P, which actuate the said pivoted levers or arms, substantially as described.

7. The combination, with the sleeve B, having the gear Z, and spindle C, having a screw driver or holder C^4, of the driving-shaft E, having the gear Z, the intermediate gear Z^{xx}, the clutch on the driving-shaft, the clutch-operating lever Q, and the rotary cam-disk H^3, for slowly rotating the spindle and engaging the screw driver or holder with the head of the screw to be cut, substantially as described.

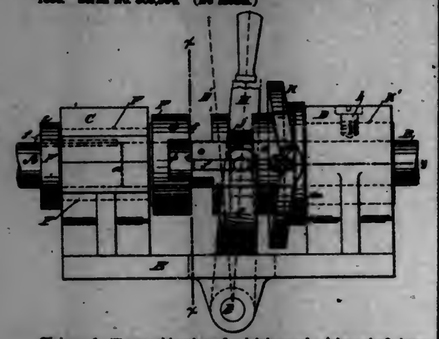


418,487. THILL-COUPLING. GEORGE I. BLAKEMAN and FRED. S. BLAKEMAN, Port Allegany, Pa. Filed Mar. 26, 1889. Serial No. 304,782. (No model.)

Claim.—1. The combination of the box adapted to receive the thill-iron and having the lateral studs H on its sides, the anti-rattler fitting snugly in the box, and the spring-keeper extending across the top of the box and having its ends bent downward and provided with perforations adapted to engage the studs H on the sides of the same, as set forth.

2. The improved thill-coupling comprising the box having the notch C in its front side to receive the thill-iron and having vertical grooves in its side wall to receive the lugs at the end of the thill-iron, the anti-rattler fitting snugly in the box above the thill-iron and having its lower side cut away to fit over the rounded end of the thill-iron, the studs H on the sides of the box, and the spring-keeper extending over the box and having its ends bent down and provided with perforations engaging said studs, as specified.

418,488. LAUNDRY-BENCH. FREDERICK W. BROOKS, Cleveland, Ohio, assignor to the Fearless Wringer and Manufacturing Company, same place. Filed Dec. 31, 1888. Serial No. 295,101. (No model.)

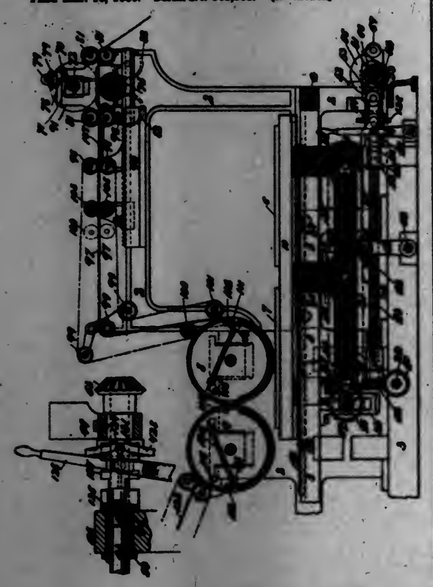


Claim.—In a laundry-bench, the combination, with the standards A A, *of* side rails B B, hinged to said standards by slotted hinges C C, and provided with the notches *d*, the brace-irons D D, pivoted to lower end *of* standards and adapted to lie in notches in the rails B B, for supporting the middle of the bench, and to be turned up for allowing the bench to be folded, substantially in the manner and for the purpose set forth.

418,489. WRINGER. FREDERICK W. BROOKS, Cleveland, Ohio, assignor to the Fearless Wringer and Manufacturing Company, same place. Filed Mar. 11, 1889. Serial No. 302,917. (No model.)

Claim.—The combination, with spring B and journals of the rollers of a wringer, of the spreading device consisting of plate *c*, pin C, cam-ring G, having handle *g*, and sleeve H, provided with a cam-surface on its lower end constructed and applied to operate substantially as described, and for the purpose specified.

418,490. CLUTCH. JOHN BROWN, Plainfield, N. J. Filed Mar. 16, 1889. Serial No. 303,504. (No model.)

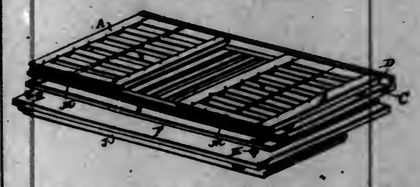


Claim.—1. The combination of a driving and a driven shaft, interlocking clutch-disks, the one rotatable and the other rotatable and longitudinally movable upon the respective shafts, a stationary cam concentric with the axis of the clutch, the face whereof is presented in a direction opposite to that of the release movement of the movable disk, said cam provided with a prominent portion and a depression M, and said movable disk provided with a projection, as the stud L, rotative in a path opposite and adjacent the cam, capable of entrance into the said depression, whereby the clutch is released at a given point.

2. The combination of a driving and a driven shaft, interlocking clutch-disks capable of engagement at a single point of rotation, one of said disks being rotatable and the other rotatable and longitudinally movable upon the respective shafts, a projection, as the stud L, upon the movable disk, a stationary cam concentric with the axis of the clutch, having a prominent portion and a depressed portion opposite said projection, said stationary cam being rotatively adjustable, for the purpose specified.

3. The combination, with the driving and driven shafts, and interlocking clutch-disks arranged substantially as specified, the longitudinally-movable member of which bears a projection, of a stationary cam opposite said projection, concentric with the axis of the clutch, having a prominent portion and a depressed portion, and provided with a shank or bushing entering the adjacent shaft-bearing, and a locking device, such as the set-screw *k*, for the purpose specified.

418,491. PRINTING-MACHINE. JOHN BROWN, Plainfield, N. J. Filed Mar. 16, 1889. Serial No. 303,503. (No model.)



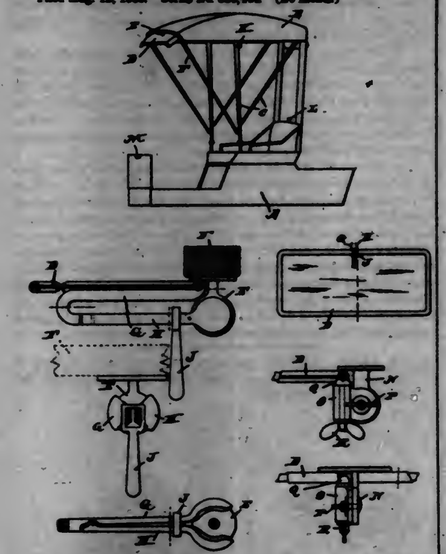
Claim.—1. In a printing-machine, the combination of a type-bed reciprocative in its plane of impression, an impression-cylinder co-operative therewith having continuous rotation, a gripper mechanism for receiving the head of a sheet at each second rotation of the cylinder, a rotary cutter adjustable at variable distances from the impression-cylinder, conveying-belts for conducting the sheets from the cutter to the grippers of the impression-cylinder, mechanism, substantially as described, for imparting to the rotary cutter a single revolution for each two revolutions of the impression-cylinder, and driving and driven shafts of said mechanism having a clutch that is releasable at a single point of rotation of the driven shaft and of the cutter.

2. The combination, in a printing-machine, of a type-bed reciprocative in its plane of impression, an impression-cylinder or cylinders co-operative therewith having continuous rotation, means and elevating mechanism, substantially as described, for elevating said cylinder or cylinders, a rotary cutter adjustable at variable distances from the cylinder-grippers, mechanism for driving said cutter and said cutter at half the rotative speed of the impression cylinder or cylinders, a driving and driven shaft of said driving mechanism connective by a clutch that is releasable at a single point of rotation of the driven shaft, corresponding with which point of rotation the cylinder-elevating cams are at an intermediate position and the rotary cutter is at an inactive position.

3. The combination of a printing mechanism having a rotary impression cylinder or cylinders, and grippers thereon for seizing the paper, a rotary paper cutting and feeding mechanism, and a clutch, substantially as described, for connecting or releasing the said cutting and feeding mechanism and the said printing mechanism at a single point of relation and at the inactive period in the motion of the cutting mechanism.

4. The combination, in a printing-machine, of a type-bed bearing the form or forms reciprocative in its plane of impression, an impression cylinder or cylinders having continuous direction of rotation, mechanism whereby the cylinders are advanced or retracted toward or from the type-bed, a rotary paper cutting and feeding mechanism adjustable in its action with definite relation to the printing mechanism, and a clutch for connecting or releasing the cutting and feeding mechanism and the cylinder advancing and retracting mechanism with the cylinder and type-bed-driving mechanism at a single point of relation, as specified.

418,492. FOLDING CRATE. WILLIAM BEEBE, Wallabout, N. Y. Filed July 17, 1889. Serial No. 317,767. (No model.)



Claim.—1. As an improved article of manufacture, the herein-described folding shipping box or crate, consisting of the bottom piece, the cleat or guard secured thereto, forming an abutment for the lower edge of the front piece and a guard for the end pieces when the box is collapsed, the end pieces hinged to said bottom piece by inwardly-opening hinges, the back piece connected to said bottom by outwardly-opening hinges, the top piece connected to said back piece by inwardly-opening hinges, the front piece connected to said top piece by outwardly-opening hinges, the hooks secured to the end pieces and engaging screw-eyes in the top piece, and the side bolts for locking the front, back, and end parts together when the box is put together or closed, substantially as set forth.

2. As an improved article of manufacture, the herein-described folding shipping box or crate, consisting of the bottom piece, the cleat or guard secured thereto and provided near opposite ends with bolt-holes, the end pieces hinged to said bottom piece by inwardly-opening hinges, and the slats or solid panel thereof being provided with bolt-holes or recesses, the back piece connected to said bottom by outwardly-opening hinges and having the end slats or opposite ends of the panel thereof provided with bolt-holes, the top piece connected to said back piece by inwardly-opening hinges, the front piece connected to said top piece by outwardly-opening hinges and having the end slats or opposite ends of the panel thereof provided with bolt-holes, the hooks secured to the end pieces and engaging screw-eyes in the top piece, and the notted side bolts, substantially as set forth.

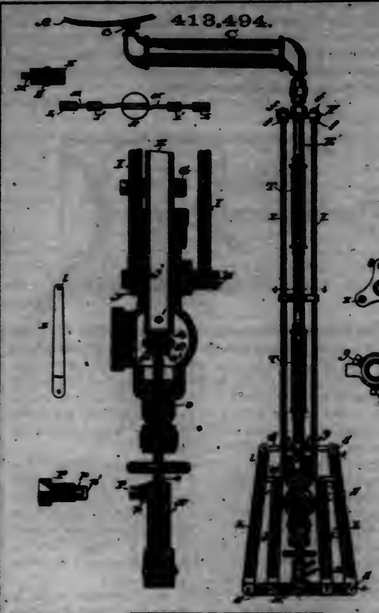
3. As an improved article of manufacture, the herein-described folding shipping box or crate, having its sides formed of vertical slats or solid panels and horizontal connecting-pieces, said vertical slats having beveled ends terminating in shoulders, and the horizontal connecting-pieces having registering inclines and shoulders, substantially as set forth.

4. In a folding shipping box or crate, the combination of the end pieces having angular notches upon their inner corners, said end pieces consisting of vertical slats or solid panels having opposite beveled ends terminating in shoulders and horizontal connecting-pieces having registering inclines and shoulders, the bottom piece having its slats or solid panel and connecting-pieces constructed similarly to the end pieces, the rear connecting-piece thereof, however, being further provided with a lateral extension, the back piece having angular notches upon its corners and consisting of the upper connecting-piece provided with beveled and shouldered inner face, slats or solid panel having opposite beveled ends terminating in shoulders, and lower connecting-piece having beveled inner face terminating in a reduced extended portion, the lower ends of the vertical slats or solid panel of said back piece adapted to rest upon the rearward extension of the bottom piece, the top piece, and the front piece having angular notches upon its inner corners, the slats or solid panel and connecting-pieces thereof constructed similarly to the end pieces, substantially as set forth.

418,493. VEHICLE-FENDER. REMAN CRAWFIS, Greenon, Ohio. Filed Aug. 13, 1888. Serial No. 282,444. (No model.)

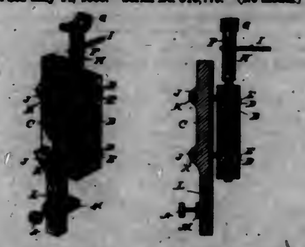
Claim.—1. In a vehicle-fender, the combination, substantially as set forth, of a rectangular fender, a pivot-clamp attached thereto at one of its edges, and a pivot fixed to the front edge of the vehicle-top and adapted to be separably engaged by said pivot-clamp.

2. In a vehicle-fender, the combination, substantially as set forth, of a rectangular fender, a pivot-clamp attached to each fender at the center of length thereof at one edge, and a pivot fixed to the front edge of the vehicle-top and adapted to be separably engaged by said pivot-clamp.



3. In a vehicle-fender, the combination, substantially as set forth, of a fender having one water-proof face and one ornamental face, a pivot attached to the front of the top of the vehicle, and a pivot-clamp attached to one edge of each fender and adapted to engage said pivot in such manner as to be capable of universal motion thereon, so that said fender can be adjusted to angles with either of its faces upwardly.

4. In a vehicle-fender, the combination, substantially as set forth, of a pivot attached to the vehicle-top, a similar pivot attached to the vehicle-dash, a rectangular fender, and a pivot-clamp attached to one edge of each fender and adapted to engage either of said pivots when either side of said fender is presented upwardly.



418,494. STEAM-TRAP. JOHN CORNELL, Brooklyn, N. Y. Filed Jan. 12, 1889. Serial No. 296,161. (No model.)

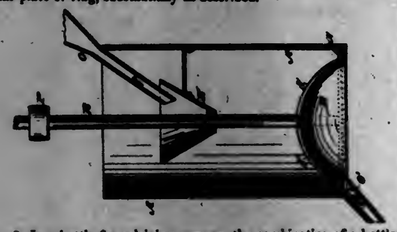
Claim.—The combination, with the apparatus A and steam-tube E, of the horizontal tubular chamber C, of considerably greater diameter than the steam-tube and than the discharge-opening into it from the said apparatus, substantially as specified.

418,494.

418,495. TIRE-TIGHTENER. CHARLES O. DAVIDSON, Carrington, Dak. Filed May 14, 1889. Serial No. 310,773. (No model.)

Claim.—1. A device for use in tightening tires, comprising two members adapted to be clamped around a spoke, one of said members being provided with a longitudinal groove, a clamp embracing said member and the spoke and carrying a set-screw adapted to engage the said groove, and a jack-screw mounted in the other member and adapted to bear on the felly, as set forth.

2. A device for use in tightening tires, comprising the members B C, adapted to be clamped around a spoke, the member B being provided on its outer side with the transverse grooves D and the member C having the tubular offsets J, the bolts having their shoulders engaging the grooves D, the pins K, inserted through the ends of the bolts, and the offsets J, and the jack-screw mounted in the member B and adapted to bear against the felly, as set forth.



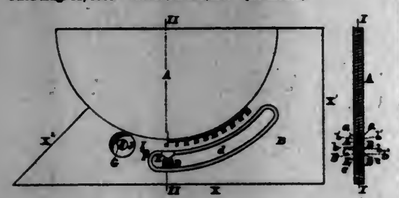
3. A tire-tightener comprising two members, one of said members having a longitudinal groove in its outer side at its lower end, a U-shaped clamp, a set-screw mounted in said clamp and engaging the said groove, bolts connecting the members, and a jack-screw mounted in one of the members, as set forth.

4. A tire-tightening device comprising two members adapted to be clamped around a spoke, a jack-screw carried by the members to engage the felly, and the clamp embracing the spoke and engaged with the members, and the swinging bolts to connect the members together, as set forth.

418,496. KETTLE FOR CALCINING GYPSUM. LEWIS C. DAVIDSON, Grand Rapids, Mich. Filed June 26, 1889. Serial No. 315,191. (No model.)

Claim.—1. In a kettle for calcining gypsum, the combination of the kettle-bottom having a circular portion horizontal, or nearly so,

and a central upper inclined portion rising from said horizontal portion, an annular plate or ring adapted to revolve within the kettle and in close contact to the inner horizontal surface of the kettle-bottom, arms within the kettle connecting said annular plate with the central shaft, a central shaft, and suitable mechanism for revolving said annular plate or ring, substantially as described.



2. In a kettle for calcining gypsum, the combination of a kettle-bottom having an upwardly-inclined under surface, a plate or ring adapted to travel near the inner periphery of the kettle and in close proximity to the bottom of the kettle, arms connecting said annular ring or plate to the central shaft, said arms adapted to travel in close proximity to the inclined portion of the kettle-bottom, and a shaft adapted to support said arms and annular plate or ring and convey motion to the same, substantially as described.

3. In a kettle for calcining gypsum, the combination of the kettle-bottom having an upwardly-inclined under side, an annular plate or ring adapted to travel near the inner periphery of the kettle and in close proximity to the kettle-bottom, arms connecting the annular plate or ring to the central shaft, a central shaft adapted to support the arms and ring, suitable mechanism for giving a rotary motion to said shaft, an outlet for the escape of the calcined material at or near the bottom of said kettle, and an inlet near the top.

4. In a kettle for calcining gypsum, the combination of the inclined bottom, the annular plate or ring, the arms constructed as above described, a central shaft supporting the arms, the inlet spout or pipe, and a hopper, through which the central shaft passes, having a discharge near the central portion, substantially as described.

418,497. PROTRACTOR. CLARENCE E. DE PUY, Jackson, Mich.
Filed Aug. 23, 1888. Serial No. 283,497. (No model.)

Claim.—1. A protractor consisting of a frame with a part of a semicircular depression on one edge, a corresponding semicircular ruler turning in said depression, a projecting tongue from one piece entering a corresponding slot in the other, and V-shaped grooves on edge of one of semicircular parts, one on each side of said tongue, fitting over corresponding V-shaped elevations on edge of other semicircular part, for purposes substantially as set forth.

2. A protractor consisting of a frame with a part of a semicircular depression on one edge, a corresponding semicircular ruler turning in said depression, projecting tongue and V-shaped grooves on semicircular edge of one piece fitting corresponding slot and V-shaped elevations on semicircular edge of the other, and a thumb-nut and washer with V-shaped channel placed in a slot cut through side of protractor, so that said nut and washer are entirely contained between the two surfaces of sides of protractor, and being for the purpose of clamping the semicircular ruler, substantially as set forth.

3. A protractor consisting of a frame with a part of a semicircular depression on one edge, a corresponding semicircular ruler turning in said depression, a projecting tongue and V-shaped grooves on edge of one piece fitting corresponding slot and V-shaped elevations on the other and arranged to be clamped with a thumb-nut and V-shaped washer, and a segment of a circle of some thin metal placed in same slot that receives the before-described projecting tongue, and which is also clamped to said tongue by the before-described thumb-nut and V-shaped washer, said segment having on one end a tangent screw and thumb-nut, by means of which accurate adjustments of semicircular ruler can be made in the manner hereinbefore described.

418,498. HARROW. ANDREW DOWNWARD, Utica, N. Y., assignor to the Eureka Mower Company, same place. Filed May 20, 1889. Serial No. 311,262. (No model.)

Claim.—1. In combination with the frame-bar and tooth, a block interposed between said parts and rigidly confined on the frame-bar, a shoe embracing said frame-bar, tooth, and block, and a set-screw connected to the shoe and clamping therein the aforesaid parts, as set forth.

2. In combination with the curved spring-tooth, a block interlocked with the edges of said tooth, the frame-bar interlocked with the said block at the edges at right angles to the edges of the tooth, a shoe embracing said parts, and a set-screw connected to the shoe and clamping therein the aforesaid frame-bar, tooth, and intervening block, substantially as set forth.

3. The combination of a harrow-frame having draft-bars channeled longitudinally in their under sides, shoes encompassing said bars, teeth inserted with their attaching-shanks in the shoes beneath the aforesaid bars, blocks interposed between the bars and tooth-shanks and seated in the channels of the said bars, and set-screws connected to the shoes and clamping therein the aforesaid encompassed parts, substantially as set forth and shown.

4. The combination of a harrow-frame having draft-bars channeled longitudinally in their under sides, a shoe formed in one piece with passages extending transversely through it and with a screw-threaded eye through its top, one of the channeled draft-bars extending through one of the passages of the shoe, a tooth having its attaching-shank extending through the other of the aforesaid passages, a block seated in the channel of the draft-bar and interposed between said bar and tooth-shank and formed with downward projections at opposite edges of the tooth-shank, and a set-screw inserted in the screw-threaded eye of the shoe and clamping in said shoe the parts encompassed therein, substantially as described and shown.

418,499. HARROW. ANDREW DOWNWARD, Utica, N. Y., assignor to the Eureka Mower Company, same place. Filed May 20, 1889. Serial No. 311,263. (No model.)

Claim.—1. In a harrow or cultivator, an attachment for the transversely-flat spring-tooth, comprising a shoe formed with a slot through it, the tooth having its shank inserted in said slot, and a tightener inserted in the shoe at the edge of the tooth-shank to crowd the said shank laterally with its opposite edge against the adjacent side of the slot, substantially as set forth.

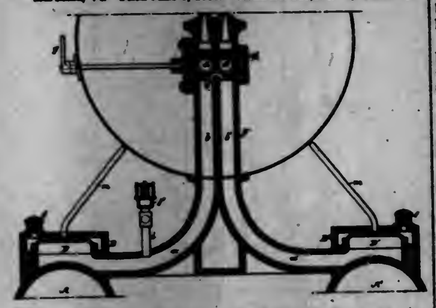
2. In a harrow or cultivator, an attachment for the transversely-flat spring-tooth, comprising a shoe formed with a slot through it and with a screw-threaded eye horizontally through the side of the shoe intersecting the slot, the tooth having its shank inserted in said slot, and a set-screw in the aforesaid screw-threaded eye engaging the edge of the tooth-shank, as set forth and shown.

3. In a harrow or cultivator, a spring-tooth attachment comprising a shoe having a slot extending through it and one side of said slot formed wedge-shaped, a tightener in the opposite side of the shoe, and the tooth having its shank inserted in the slot of the shoe and crowded into the wedge-shaped side of the slot by the aforesaid tightener.

4. The combination, with the frame, of a spring-tooth-retaining shoe provided with a bolt-hole vertically through its central portion and terminating in the cavity of the shoe, and a bolt passing through said hole and frame and fastening the shoe to the frame, as set forth.

5. The combination, with the frame, of a spring-tooth-retaining shoe provided with a bolt-hole vertically through the central portion of its top plate and terminating in the cavity of the shoe, and with a recess in the under side of said plate, and a bolt passing through the aforesaid hole and frame and having its head seated in the recess of the shoe, and a nut on the opposite end of the bolt, substantially as described and shown.

6. In combination with the frame, a shoe secured to said frame and having a slot extending through it, and one side of said slot formed wedge-shaped, and the opposite side of the shoe formed with a laterally-outward-projecting tubular boss screw-threaded internally, the tooth having its shank inserted into the slot of the shoe, and a set-screw in the tubular boss engaging the edge of the tooth-shank, substantially as described and shown.



7. In combination with the frame, a tooth-retaining shoe provided with a bolt-hole through its top plate, an aperture in its bottom plate for the passage of the head of the bolt, and a bolt passing through the top plate of the shoe and through the frame and having its head inside of the shoe, and a nut on the upper end of the bolt, substantially as described and shown.

8. In combination with the longitudinally-channeled bar A, the shoe B, having the slot *a*, extending through it and formed with the tenon *b*, and seated thereby in the channel of the bar A, and the bolt *c*, passing vertically through the tenon of the shoe and through the aforesaid bar and having its head inside of the shoe, as set forth and shown.

9. In combination with the longitudinally-channeled bar A, provided with bolt-holes, the shoe B, formed with the slot *a* for the reception of the tooth, and with the tenon *b*, recess *b'* in the under side of said tenon, a bolt-hole vertically through the tenon, the aperture *d* in the bottom plate of the shoe, and the bolt *c*, passing through the bolt-holes of the aforesaid tenon and channeled bar and having its head seated in the recess *b'*, substantially as described and shown.

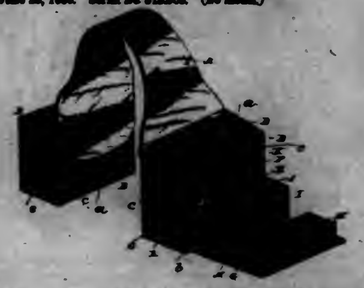
10. The combination of the longitudinally-channeled draft-bar A, disposed with its channel downward, the saddle *c*, seated on top of the bar A and having downward flanges embracing the sides of said bar and upward flanges transverse of the bar, the cross-bar A', seated on the saddle between the upward flanges thereof, the shoe B, formed with the slot *a* and with the tenon *b*, seated in the channel of the bar A, and with the screw-threaded tubular boss *f* on its side, the tooth D, inserted into the slot *a*, the set-screw *g*, inserted into the boss *f*, and the bolt *c*, passing vertically through the top plate of the shoe and through the bar A, saddle *c*, and bar A', and having its head inside of the shoe, and a nut on its upper end, substantially as described and shown.

418,500. BRAKE FOR LOCOMOTIVES. HENRY D. DUNBAR, North Hartland, Vt. Filed June 6, 1889. Serial No. 313,271. (No model.)

Claim.—1. The combination of the cylinders, valve-chests, and exhaust-passages of the engine, a valve for closing said exhaust-passages, and a pipe providing a communication between the exhaust-passages and the boiler, whereby steam may be admitted to the exhaust-passages for the purpose of making an emergency stop, substantially as specified.

2. The combination of the cylinders, valve-chests, and exhaust-passages of the engine, a valve for closing said exhaust-passages, and pipes independent of the main steam-supply for permitting the introduction of steam into the valve-chests, substantially as specified.

3. The combination of the cylinders, valve-chests, and exhaust-passages of the engine, and the valve for closing said exhaust-passages, said valve having a by-pass, whereby when it is closed to cut off the escape of steam from the passages it provides a communication from one passage to the other, substantially as specified.



4. The combination of the cylinders, valve-chests, and exhaust-passages of the engine, the valve for closing said exhaust-passages, supplementary steam-pipes—one communicating with the exhaust-passage and the other communicating with the valve-chests—and a compound valve for controlling the flow of steam into said supplementary steam-pipes, substantially as specified.

5. The combination of the valve-box, its steam-inlet pipe, and the outlet-pipes with a single valve having a steam-inlet port communicating with valve-box and opposite ports for governing the flow of steam through the outlet-pipes, substantially as specified.

6. The combination of the cylinders, steam-chests, and exhaust-passages, and a valve for closing the latter, the supplementary steam-pipes and their valve-box, the valve in the latter, a lever for operating the valve in the exhaust-passage, and an operating-arm on the valve of the valve-box, said lever and arm occupying such position as to be operated simultaneously, substantially as specified.

7. The combination of the cylinders, valve-chests, and exhaust-passages of the engine with a pipe *i*, communicating with said exhaust-passages and with the boiler, a valve for cutting off the communication with the boiler, a pressure-gage, and a branch pipe whereby said gage is put in communication with the pipe *i* and the exhaust-passages, substantially as specified.

418,501. SADDLE-BAGS. JOHN D. BOZEE, Aberdeen, Miss. Filed June 28, 1889. Serial No. 315,305. (No model.)

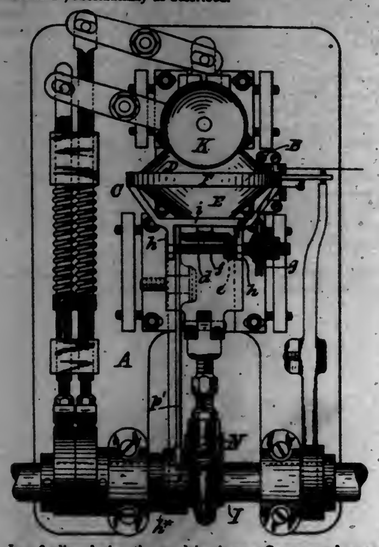
Claim.—1. In a saddle-bag, the combination of the open front compartment C, the swinging side G, hinged thereto, the box I, hinged to said swinging side, and connections between the box and the swinging side, and the box and the compartment C, whereby when the said swinging side is drawn outward and downward the box will be swung out from the compartment C, as set forth.

2. The combination of the compartment C, the swinging side G, hinged thereto, the box I, hinged to the said swinging side, and the links connecting said box with the compartment C, as set forth.

3. The combination of the compartment C, the swinging side G, hinged thereto and provided with the compartment H, the box I, having the ledge M, hinged to said swinging side, and the links connecting said box with the compartment C, as set forth.

4. The improved saddle-bag consisting of the compartment C, having the internal partitions E, the swinging side G, hinged to said compartment and provided with the compartment H, and the box I, having the internal partitions J, all arranged substantially as specified.

5. The improved saddle-bag consisting of the open front compartment C, attached rigidly to the ends of the saddle-strap and having the internal partitions E, and the swinging side G, closing the outer side of the compartment C, and provided with a box I, adapted to rest on top of the partitions E when the hinged side is closed, as set forth.



418,502. FEEDING DEVICE FOR BUTTON-MAKING MACHINES. ROBERT L. ELLERY, Taunton, Mass., assignor of one-half to Francis E. Fuller, same place. Filed Nov. 10, 1888. Serial No. 289,482. (No model.)

Claim.—1. In a button-making machine, the combination, substantially as described, of the driving-shaft, the fixed plate *f'*, the plate *f*, adapted to slide bodily back and forth on said fixed plate *f'*, the feed-lever *r*, pivoted to said sliding plate *f*, and an intermediate lever driven by said shaft and operating to drive said lever *r* and said sliding plate *f* back and forth on said fixed plate *f'*, said intermediate lever imparting four distinct motions to said feed-lever.

2. In a feeding device, the combination of the feed-lever *r*, pivotally mounted on the sliding plate *f*, the lever *m'*, engaging said feed-lever *r*, and the connecting-rod *p'*, operated by the shaft I and imparting reciprocating motion to said lever *m'*, whereby said feed-lever *r* has its operative end first raised from or lowered into the runway *p* by the action of said lever *m'*, said feed-lever *r* being then carried bodily with the sliding plate *f* backward or forward by the continued action of said lever *m'* thereon, substantially as described.

3. In a button-making machine, the combination of the following elements: the driving-shaft, the button-blank-feeding lever, a device connecting said feeding-lever to said driving-shaft, the plate *a''* pro-

vided with the runway *p* for the reception and passage of the button-blanks, and the spring *F*, normally closing said runway, but adapted to be pushed aside by the advancing button-blank to allow the passage of the same, substantially as described.

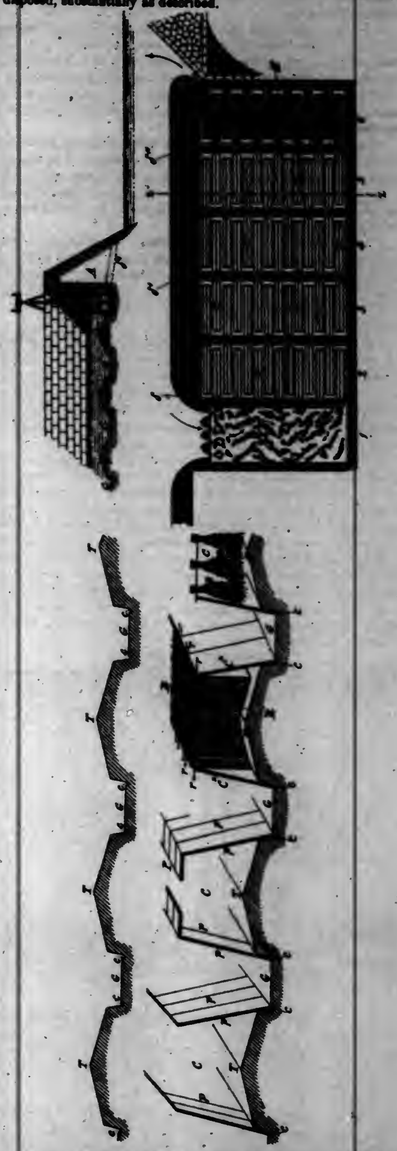
4. In a feeding device, the revolving hopper C, composed, essentially, of two hollow truncated cones or dish-shaped parts D E, adjustably connected together, the bases of said truncated cones being toward each other and having a space between them, substantially as set forth.

5. In a button-making machine, a feed mechanism composed, essentially, of the following elements: a revolving hopper, a plate adjacent thereto provided with a groove or runway for the reception of the button-blanks from said revolving hopper, a four-motion traveling feed-lever provided with points adapted to push the button-blanks forward, another lever engaging and operating said feed-lever, and a connecting-rod connecting said second-named lever with the driving-shaft.

413,508. APPARATUS FOR THE CULTIVATION OF OYSTERS.

LEE FALKNER, London, England. Filed May 23, 1889. Serial No. 311,843. (No model.)

Claim.—1. An artificial bed for the culture of oysters in sea-water, comprising a series of tables having inclined top surfaces extending downward in opposite directions, a series of gutters, one between each pair of tables, and spat-collecting walls rising upward from the opposite sides of each table, substantially as described.



2. An artificial bed for the culture of oysters in sea-water, comprising gutters alternating with tables having top surfaces inclining downward in opposite directions, and provided at their bases with grooves or channels and spat-collecting walls resting at their lower edges in the grooves or channels and rising above the highest portions of the tables, substantially as described.

3. An artificial bed for the culture of oysters in sea-water, comprising gutters alternating with tables, each having inclined top surfaces and a groove or channel at each side of its base, and spat-collecting walls arranged in the grooves or channels resting against the sides of the tables and rising above the highest portion of the latter, substantially as described.

4. An artificial bed for the culture of oysters in sea-water, comprising mud-receiving gutters alternating with tables, each having its top surface inclined downward in opposite directions from the center, and two spat-collecting walls rising, respectively, from the opposite sides of each table for holding the spat thereupon, substantially as described.

5. An artificial bed for the culture of oysters in sea-water, comprising gutters alternating with tables, each having its top surface inclined downwardly in opposite directions from the center, and two spat-collecting walls rising, respectively, from the gutters at opposite sides of each table, and each wall consisting of a series of plates arranged one beside the other to form a continuous wall rising above the highest portions of the table, substantially as described.

6. An artificial bed for the culture of oysters in sea-water, comprising a series of inclined tables, alternating gutters, spat-collecting walls rising from each table, and a fattening-hive composed of a series of superposed trays with intervening spaces in which the oysters are disposed, substantially as described.

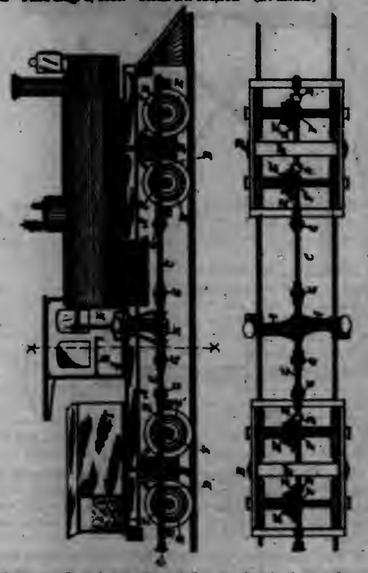
7. An artificial bed for the culture of oysters in sea-water, comprising a series of ponds having inclined tables with side gutters, spat-collecting walls rising above each table, and one pond containing a fattening-hive composed of superposed trays having interlocking rims and feet, and intervening spaces in which the oysters are disposed, substantially as described.

8. An artificial oyster-bed comprising a series of ponds each containing a table T, having inclined surfaces, a mud-receiving gutter G between each pair of tables, the spat-collecting walls rising above the tables, the stagnation-pond X, the fattening-hive H, composed of a

cellular structure in one of the ponds, and sluices for connecting the several ponds with the sea, substantially as described.

413,504. ANNUNCIATOR.

FRANK S. FISHER, Detroit, Mich. Filed June 6, 1888. Serial No. 313,242. (No model.)



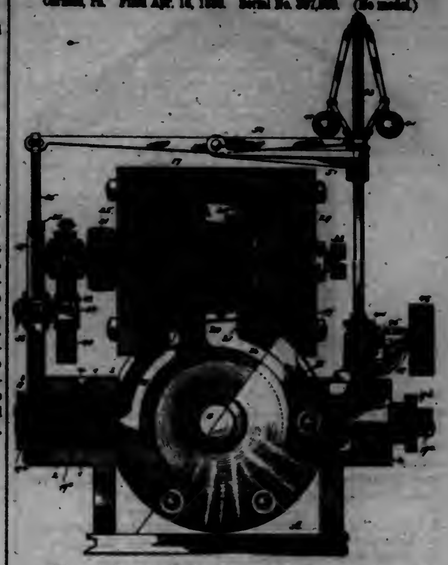
Claim.—1. The combination, in an annunciator, of an electro-magnet and an axially-oscillatory armature carrying a needle and extending beneath and bodily raised by the two poles of the electro-magnet, substantially as described.

2. In an annunciator, the combination, with an electro-magnet having a core B, carrying the pole-pieces D and F, and having the detent H formed on its end, of the armature shaft K, extending beneath both the pole-pieces, bodily lifted thereby, and carrying on one end the needle L and on the other end the counterweighted frame I, having thereon a ratchet-tooth, substantially as shown and described.

3. The combination, in an annunciator, of a face-plate, an electro-magnet comprising a detent, a diamagnetic plate extending below the magnet and having a slot, and an axially-oscillatory armature journaled in the face-plate and diamagnetic plate, carrying a needle at one end and a toothed frame at the other end, and extending beneath and bodily raised by the two poles of the magnet, substantially as described.

413,505. TRAMWAY-LOCOMOTIVE.

GEORGE D. GILBERT, Corry, Pa. Filed Aug. 6, 1889. Serial No. 320,208. (No model.)



Claim.—1. In a locomotive of the type herein shown, the combination, with the axles *b* and the skew-gears E thereon, the propelling-shaft C, crossing said axles at right angles, and the skew-pinions D thereon, meshing with the said skew-gears E, of the double-journaled boxes F, embracing the said axles and shaft, substantially as shown.

2. In a locomotive of the type herein shown, the combination, with the side truck-frames B', carrying journaled boxes b^3 and b^4, of the middle cross-bars B^3 and B^4, journaled in said boxes b^3 b^4, and the end cross-bars B^5 B^5, hinged at each end to the said side frames B', substantially as shown.

3. In a locomotive of the type herein shown, the combination of a boiler, a cab back of said boiler and over the firing-door of the fire-box of said boiler, a fuel-box back of said cab, a longitudinal centrally-located driving-shaft below said boiler, cab, and fire-box, and two engines acting on said shaft, which are cut at right angles to each other, with the said shaft at the apex of said angle, and placed mainly below the floor of said cab and back of the fire-box of said boiler.

413,506. OSCILLATING STEAM-ENGINE.

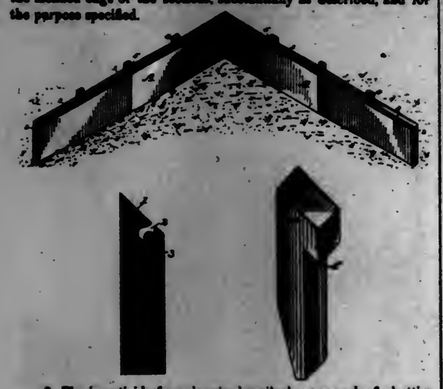
WILLIAM A. GRAHAM, Carlisle, Pa. Filed Apr. 16, 1888. Serial No. 307,008. (No model.)

Claim.—1. In an oscillating steam-engine, the combination, with an oscillating cylinder and valve-chest, the said parts having communicating ducts, whereby steam is admitted to and exhausted from the opposite ends of the cylinder, of a tapering valve fitted to the walls of the valve-chest, said valve having ports therein for directing the passage of steam, a steam-balancing chamber between the valve and its seat, a stationary device, and sliding connections between the stationary device and valve, whereby the throw of the latter is regulated by the oscillation of the cylinder, substantially as set forth.

2. In an oscillating steam-engine, the combination, with an oscillating cylinder mounted on hollow trunnions, and a valve-chest integral with the cylinder, the said parts having communicating ducts, whereby steam is admitted to and exhausted from the opposite ends of the cylinder, and also ducts leading from the latter into the trunnions for the live and exhaust steam, of a tapering valve fitted to the walls of the valve-chest, said valve having ports therein for directing the passage of steam, a steam-balancing chamber between the valve and its seat, a stationary device, and sliding connections between the stationary device and valve, whereby the throw of the latter is regulated by the oscillation of the cylinder, substantially as set forth.

3. In an oscillating steam-engine, the combination, with an oscillating cylinder, a valve-chest, and valve, of reciprocating stem and means for connecting said stem loosely with the valve, whereby motion of the valve and engine is regulated, substantially as set forth.

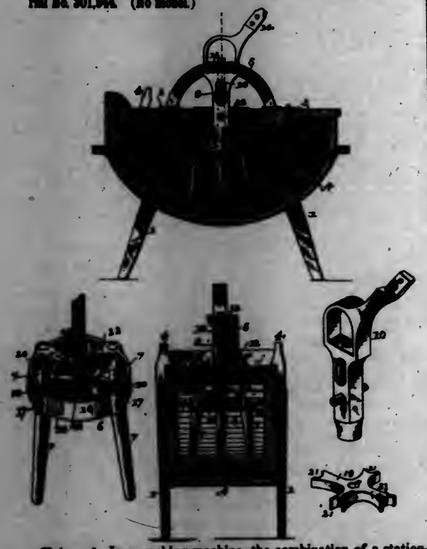
4. In an oscillating steam-engine, the combination, with an oscillating steam-cylinder, a valve-chest, and valve, of a slotted standard, a reciprocating stem, a slide-block, said block and the valve having sliding jointed connection with each other, and means for automatically raising and lowering the stem, whereby the throw of the valve and the motion of the engine are regulated, substantially as set forth.



5. In an oscillating steam-engine, the combination, with a frame, pillow-blocks, an oscillating cylinder supported on said blocks, a valve-chest, valve, piston, piston-rod, fly-wheel, rotary drive-shaft, and pulleys, of a standard secured to the frame, a slide-block and reciprocating stem, said block having sliding connection with the valve, a governor for operating the stem, and a belt for operating the governor from the drive-shaft, substantially as set forth.

413,507. COMBINED FENCE AND INSECT-DESTROYER.

CHAS. B. HALSTEAD, Humboldt, Kans. Filed Apr. 6, 1889. Serial No. 306,346. (No model.)

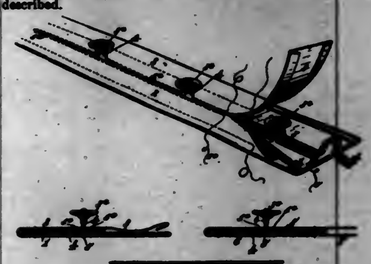


Claim.—1. The insecticide-fence herein described, composed of sections of single narrow boards having their upper edge formed at an incline, and a groove in said inclined edge made larger at the bottom than at the opening, to receive and contain an insecticide, and fastening-pins formed with projecting heads having lips formed to fit over

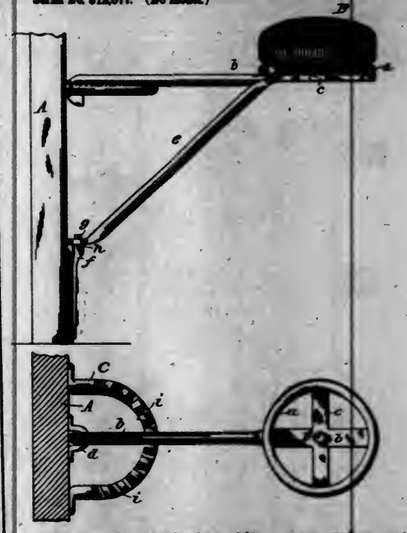
the inclined edge of the sections, substantially as described, and for the purpose specified.

2. The insecticide-fence herein described, composed of abutting sections of single narrow boards having their upper edges formed at an incline, a groove in said inclined edge, cents or countersinks in the end faces of the sections, a saturable material arranged in each section, with the ends projecting beyond the ends of the sections and arranged and secured in the end counterssinks thereof, and posts having heads projecting on and over the inclined edges of the sections, substantially as described, and for the purpose specified.

418,508. WASHING-MACHINE. Joseph Hahn, Morgansville, assignor of one-half to Levi Bear, Bryett, Md. Filed Mar. 5, 1889. Serial No. 301,944. (No model.)



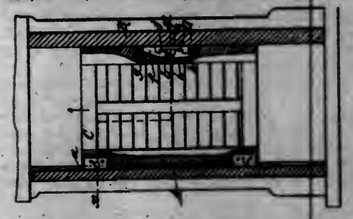
Claim.—1. In a washing-machine, the combination of a stationary tub, a standard journaled thereon, a shaft in the standard, and a rotary and oscillatory agitator on the shaft, substantially as described.



2. In a washing-machine, the combination of the tub, a vibratory standard journaled thereon, a shaft mounted in the standard carrying at its lower end an agitator and at its upper end a bevel-gear, and a stationary rack-plate secured to the tub and engaging the said bevel-gear, whereby when the standard is operated a rotary and oscillatory motion will be imparted to the agitator, substantially as described.

418,509. BUTTON-STRIP. Joseph H. Haviland and Truman A. Mitchell, Woodport, N. Y. Filed July 5, 1889. Serial No. 316,575. (No model.)

Claim.—A button-strip comprising a base-strip having one edge folded over and stitched along its longitudinal edge at or near the center of the strip, a continuous tape having one longitudinal edge underlying the longitudinal edge of the folded part of the strip and provided with a series of loops each passing through the eyes of a button, and a strip stitched to the base-strip and having a longitudinal edge overlying the other longitudinal edge of the looped tape and stitched thereto and to the base-strip, said loops of the tape projecting between the adjacent longitudinal edges of the strips, substantially as described.



418,510. TABLE, DESK, OR STORE-COUNTER SEAT. John A. Heard and George S. Mitchell, New Albany, Miss. Filed May 25, 1889. Serial No. 312,077. (No model.)

Claim.—1. The combination, with a support, such as a store-counter, of the pivoted arms *c b*, a seat supported thereby, and an independent supporting-brace C, secured to said support and extending below the arm *b* as a guide and support for said arm, substantially as set forth.

2. The combination, with a support A, such as a store-counter, of the pivoted arms *b c*, a stool supported thereby, and an independent supporting-bracket below said arm *b*, having a series of notches in its upper edge, substantially as described.

418,511. HOLDER FOR SASHES OR BLINDS. Wallace S. Holland, Pasadena, Cal. Filed Mar. 7, 1889. Serial No. 302,501. (No model.)

Claim.—In a sliding blind, the combination, with a groove having one end elevated and a spring located therein, of a bar provided with rollers engaging said spring, whereby the friction will be lessened when the blind is elevated, substantially as shown and described.

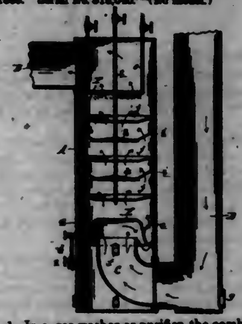
418,512. ELECTRIC SWITCH. Robert G. Hull, Baltimore, Md. Filed July 9, 1889. Serial No. 316,988. (No model.)

Claim.—1. The combination of a contact-lever, resistances traversed thereby, a beam connected with the lever, a handle-bar, and a sliding connection between the said beam and handle-bar, as and for the purpose described.

2. The combination, with a contact-lever, of resistances traversed thereby, a beam connected to the said lever, a handle-bar crossing the said beam, an axle common to the said beam and handle-bar at their point of intersection, and devices tending to change the position of the said axle in relation to the said beam and handle, and thus to move the point of intersection, as and for the purposes described.

3. The combination, with a contact-lever, of resistances traversed thereby, a beam connected to the said lever, a handle-bar crossing the said beam, an axle common to the beam and handle-bar at their point of intersection, devices tending to change the position of the said axle in relation to the said beam and handle-bar, and thus to move the point of intersection, and a retarding device whereby such a change is governed, as and for the purposes described.

4. The combination of a pivoted contact-lever, a source of electricity, the said contact-lever being in circuit through the said source with the armature and field-magnet coils of an electrical motor, an electrical motor, resistances traversed by the contact-lever, and which are in circuit with the armature-coils of the motor, a contact-arc, also traversed by the contact-lever, in circuit with the field-magnet coils of the motor, a beam connected with the contact-lever, a handle-bar crossing the said beam, an axle common to the beam and handle-bar at their point of intersection, springs mounted on the handle-bar tending to change the position of the said axle in relation to the said beam and handle-bar, and thus to move the point of their intersection, and a retarding device, whereby such a change is governed, as and for the purposes described.

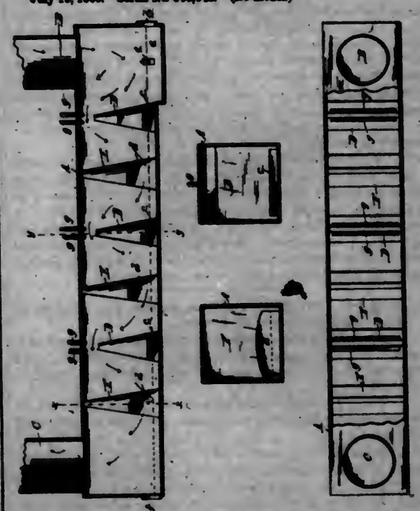


5. The combination of a pivoted contact-lever, resistances traversed thereby, a beam having a longitudinal slot mounted on the pivot of said lever, a pivoted handle-bar having a longitudinal slot, an axle received by the slots of the beam and handle-bar, springs whereby the axle is changed in its relation to the handle-bar and beam and the contact-lever moved, a ratchet transmitting motion to an escape-wheel, and an escape, whereby the movement of the contact-lever is retarded, as and for the purposes described.

6. The combination of a pivoted contact-lever, resistances traversed thereby, a beam having a longitudinal slot mounted on the pivot of the said lever, a pivoted handle-bar having a longitudinal slot, an axle received by the slots of the beam and handle-bar, springs whereby the axle is changed in its relation to the handle-bar and beam and the contact-lever moved, and a retarding device, whereby the movement of the contact-lever in one direction is governed, as and for the purposes described.

418,513. PROCESS OF CARBURIZING IRON. Philip J. Ibbs, U. S. Navy. Filed Jan. 3, 1889. Serial No. 295,807. (No specimens.)

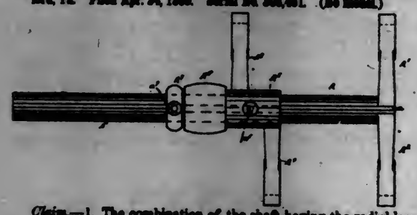
Claim.—The hereinbefore-described process of carburizing iron, consisting in subjecting the iron to a mixture of graphite, then applying to the iron, in a muffle closed to the atmospheric air, a hydrocarbon vapor, and finally applying steam, substantially as described.



418,514. GAS-WASHER. Charles W. Jarell, Shelby, Ala. Filed July 19, 1889. Serial No. 318,040. (No model.)

Claim.—1. In a gas washer or purifier, the combination, with the upright vessel A, having at or near its top an outlet for the washed or purified gas, and at or near its bottom with a curved inlet or supply pipe extending upwardly within said vessel, of an inverted-cup-shaped deflector supported above the inner end of said pipe, and the pipe *c*, extending downwardly within the vessel and terminating slightly above the deflector, substantially as shown, and for the purpose described.

2. In a gas washer or purifier, the combination, with the upright vessel A, having gas inlet and outlet pipes and provided with the inverted-cup-shaped deflector, of the circular inclined water-shelves *h h*, arranged centrally within the vessel, the surrounding inclined side shelves *j*, alternating therewith, and the spray-pipes located above said shelves within the vessel A, substantially as shown and described.

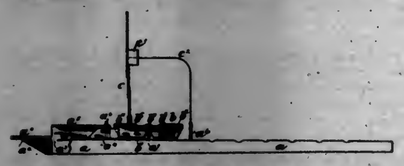


418,515. GAS-WASHER. Charles W. Jarell, Shelby, Ala. Filed July 19, 1889. Serial No. 318,041. (No model.)

Claim.—The shell or casing A, having the double inclined bridge-

walls D, formed with the openings *c*, and the double inclined division-walls alternating with said bridge-walls and having the enlarged spaces *d*, in combination with spray-pipes so arranged as to cast a spray against the sides of the bridge-walls, substantially as described.

418,516. MICROMETER-CALIPERS. CHARLES P. JESSOP, Bradford, Pa. Filed Apr. 24, 1889. Serial No. 308,681. (No model.)



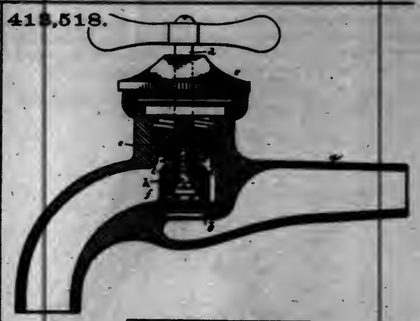
Claim.—1. The combination of the shaft having the radial legs, the adjustable sleeve having radial legs, the setting-ring, the thimble having screw-threads meshing with screw-threads on the sleeve and ring, and means for holding the parts in place, for the purpose set forth.

2. The combination of a shaft having a longitudinal groove and sliding blocks and radial legs, a sleeve having radial legs, a screw-threaded projection, and a set-screw engaging with one of the blocks in said groove, a setting-ring having a screw-threaded end, and a set-screw engaging with the other block in the groove, and a thimble having interior screw-threads engaging with the screw-threads upon the sleeve and ring, substantially as described.

3. In a caliper, the combination of the shaft having radial arms, the adjustable sleeve having radial arms and the external screw-threads, the setting-ring having external screw-threads coarser than the threads on the adjustable sleeve, and a set-screw, and the thimble secured to the sleeve and ring by screw-threads corresponding to the screw-threads on said sleeve and ring, substantially as described.

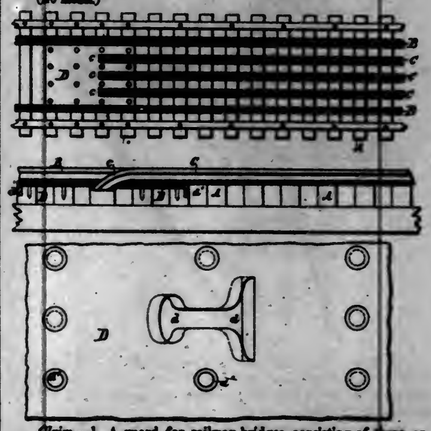
418,517. MECHANICAL TOY. FREDERICK JEWELL, Peckham, County of Surrey, England. Filed Nov. 17, 1888. Serial No. 291,108. (No model.)

Claim.—1. In a mechanical toy, the combination, with a whistle, clarionet, or other similar wind musical instrument having an air-duct, of one or more dancing or moving figures or objects and a suitable motor or motors for the figures, having an independent air-duct, said air-ducts being adapted to receive a supply of air together or separately, whereby the figures or objects are adapted to move in time to the music, or said figures or objects may receive an accelerated movement from the air-current passing through the independent duct of the motor independently of the air-current of the instrument, substantially as set forth.



2. In a mechanical toy, the combination, with a whistle, clarionet, or other wind musical instrument, of one or more dancing or moving figures or objects, a suitable motor or motors driven by means of an air current or currents, whereby said figures or objects may be set in motion, and a flexible air reservoir or container for supplying the necessary air to both the motor or motors and said wind instrument, said reservoir when compressed causing the figures or objects to move in time to the music, substantially as shown and described.

418,518. FAUCET. JOHN B. JONES, Brooklyn, N. Y. Filed Jan. 28, 1889. Serial No. 297,514. (No model.)



Claim.—1. A faucet composed of a shell *a*, having a septum *b*, a bonnet *c*, and a valve-spindle *d*, and a hollow compressible valve sprung over the end of the spindle and swiveled thereto, substantially as described.

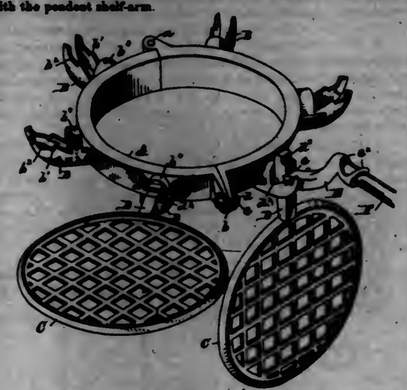
2. The compressible valve *f*, swiveled to the spindle through the intervention of the flanged thimble *g*, cap *i*, and screw *h*, substantially as described.

3. The hollow compressible valve having a solid bottom and an opening in its top, combined with a valve-spindle, a flanged thimble, over which the valve is stretched, a superposed cap, and a screw connecting the valve, thimble, and cap to the spindle, substantially as described.

418,519. GUARD FOR RAILWAY-BRIDGES. OSWALD F. JORDAN, St. Thomas, Ontario, Canada. Filed July 11, 1888. Serial No. 317,103. (No model.)

Claim.—1. A guard for railway-bridges, consisting of three or more guard-rails placed equidistant from the main-track rails and from each other, said guard-rails extending parallel with each other and with the main track throughout their length, substantially as described.

2. A guard for railway-bridges, consisting of a series of guard-rails extending parallel with the track-rails, the ends of said guard-rails sloped downward so as to terminate at or below the surface of the ties, substantially as described.

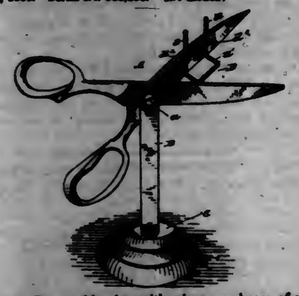


3. A guard for railway-bridges, consisting of a series of guard-rails placed equidistant from the main-track rails and from each other, said guard-rails extending parallel with each other and with the main-track rails, and having their ends curved downward and held in position by an iron plate fastened to the ties, substantially as described.

4. In a guard for railway-bridges, an iron plate for holding the ends of the guard-rails in position, said plate bolted or otherwise fastened to the ties and having the ends of the rails passed through the same, substantially as described.

418,520. STOVE-PIPE SHELF. WILLIAM H. JULIAN, Springfield, Ohio, assignor to the D. O. Myers Manufacturing Company, same place. Filed Jan. 10, 1889. Serial No. 296,093. (No model.)

Claim.—1. The combination, with an annulus or ring constructed of parts joined together so as to be opened and placed around a stove-pipe and provided with securing devices, and one or more jaws, each composed of two members reduced in thickness toward their outer ends and notched in their upper sides, and a bridge or arch extending from one member to the other at their inner ends, of one or more shelves, each having an arm notched at its inner end to fit the under side of said arch, and having lateral pins to fit said notches, the pins being arranged to rest upon the members of the jaws when the inner end of the arm is disengaged to support the shelves in a pendent position.



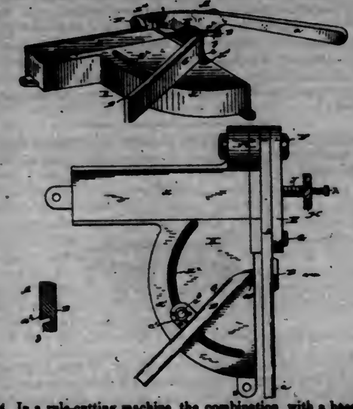
2. The combination, with an annulus adapted to be fitted upon a stove-pipe and one or more jaws extending therefrom, of one or more shelves, each having an arm with lateral projections supporting it in a pendent position within a jaw, and a socket-arm having lateral projections supporting it upon the jaw, and engaging at its inner end with the pendent shelf-arm.

3. The combination, with an annulus adapted to be fitted upon a stove-pipe and one or more jaws extending therefrom, each composed of two members having notches in their upper edges, of one or more shelves, each having an arm provided with lateral pins which support the arm within a jaw, a notch in the outer face of the arm, and one or more socket-arms, each having a bar fitted in its socket, and lateral pins at its inner end, which rest in said notches, while its inner extremity engages the notch in the pendent arm.

4. In an improved attachment for stoves, an annulus adapted to be fitted upon a stove-pipe and jaws cast integrally therewith, each jaw being composed of two members connected at their inner ends on the upper sides by an arch or bridge tapered toward their outer ends, and each provided with two notches in their upper edges.

418,521. SHEARS. WILLIAM A. KENNY, Meriden, Conn. Filed Mar. 29, 1889. Serial No. 305,203. (No model.)

Claim.—1. The combination, with scissors or shears, of a support connected thereto at their pivotal point, whereby the same may be secured to a table or bench, substantially as described.



2. In combination with scissors one blade of which is provided with holes, a gage consisting of screw-threaded arms bent and connected at one end, and set-nuts for holding said arms in position, substantially as described.

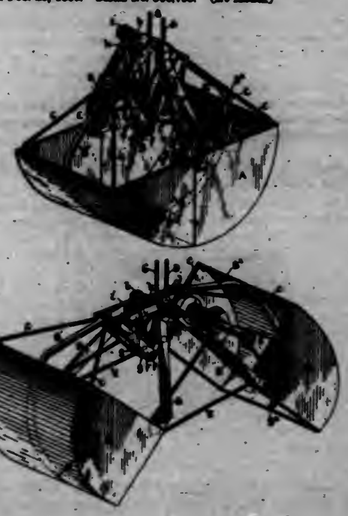
418,522. MACHINE FOR CUTTING AND MITERING PRINTERS' RULES. WILLIAM A. KENNY and RICHARD ATWATER, Meriden, Conn., assignors to the Kenny Press Company, same place. Filed May 14, 1888. Serial No. 310,703. (No model.)

Claim.—1. In a rule-mitering machine, a base having a lever pivoted thereto, said lever being provided with a cutting-edge on one side parallel with the longitudinal axis thereof, and a leg extending under the lever nearly to the vertical plane of the cutting-edge, said leg having a beveled face, substantially as described.

2. In a rule-mitering machine, a base having a lever pivoted thereto and a swinging rule-gage, said lever being provided with a cutting-edge on one side parallel with the longitudinal axis thereof, and a leg extending under the lever and having a beveled face, substantially as described.

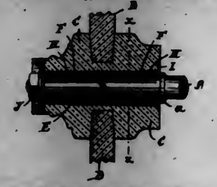
3. In a rule cutting and mitering machine, the combination, with a base having a rule-bed and a swinging rule-gage, of a lever pivoted to said base and having two cutting-edges opposite the ends of the said bed and gage, substantially as described.

4. In a rule-cutting machine, the combination, with a base having a cutting-lever pivoted thereto, of the brace E, connecting the end of the lever-fulcrum with a portion of the base distant from said fulcrum, said brace being parallel to the lever when down, substantially as described.



5. In a rule-cutting machine, the combination, with the base, of the gage H, having a screw-threaded rod J, entering a tapped hole in the base, and the screw A, passing through gage H, substantially as described.

418,523. CAM. JAMES G. KIRBY, Louisville, Ky. Filed July 26, 1889. Serial No. 319,022. (No model.)

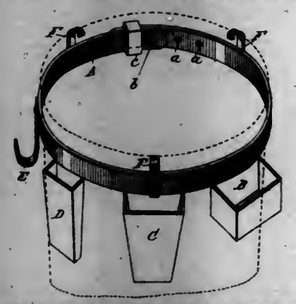


Claim.—A cam having a shoe or shoes removably fitted to rest upon its body as a wearing-surface therefor, and collars recessed to receive the edges of the said shoes and rigidly yet removably bound to the body, substantially as shown and described.

418,524. HOISTING-BUCKET. LOREN G. LANE, Pawtucket, R. I. Filed Feb. 23, 1889. Serial No. 300,795. (No model.)

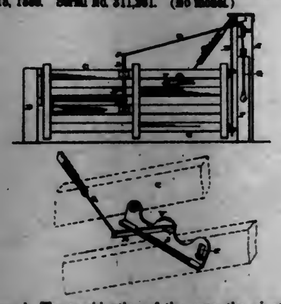
Claim.—In a hoisting-bucket composed of two parts pivoted or hinged together, and having a windlass shaft and drum mounted upon one of the halves of the bucket, the combination, with toggle-levers for opening the two parts of the bucket, of arms extending upwardly from each of the sections of the bucket and pivoted together, the arm secured to that half of the bucket which carries the windlass shaft and drum extending beyond the pivot-point and connected at its outer end with the joint of said toggle-levers, substantially as described.

413,525. ANTI-FRICTION BEARING FOR VEHICLE-WHEELS. HOSEA W. LIBBEY, Boston, Mass. Filed Mar. 5, 1889. Serial No. 301,842. (No model.)



Claim.—1. In an anti-friction bearing for vehicles, a sleeve having longitudinal ribs on its peripheral face and slots between said ribs, in combination with friction-rollers and covers or plates, substantially as shown and described.

2. In anti-friction bearing for vehicles, the combination of a sleeve the internal diameter of which is slightly larger than the spindle and having longitudinal ribs on its peripheral face, slots between said ribs, a recess around each slot, plates fitting said recesses, and friction-rollers of a diameter to just fit in the slots and between the plates and spindle, substantially as set forth.

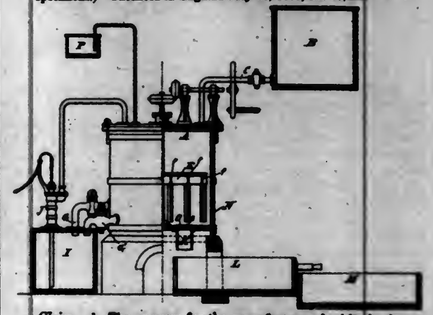


3. In an anti-friction bearing for vehicles, the sleeve E, having longitudinal ribs *c*, slots F, and a recess around each slot, in combination with the plates H and friction-rollers F, substantially as set forth.

413,526. ATTACHMENT FOR SCRUBBING-BUCKETS. ABRAHAM J. LOSER, Lebanon, Pa. Filed Mar. 22, 1889. Serial No. 304,373. (No model.)

Claim.—A bucket provided with an adjustable hoop having supporting hooks and receptacles attached thereto, said parts being combined substantially as described.

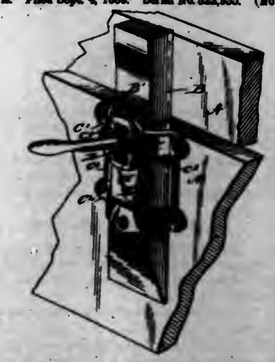
413,527. GATE. CHARLES B. LITTLE, Mount Carroll, Ill. Filed May 18, 1888. Serial No. 311,961. (No model.)



Claim.—1. The combination of the gate, the pivotal rod upon which the gate is hung, the casting secured to the gate and provided with teeth, the lever pivoted to the casting and engaging said teeth with its free end, and a brace rod or wire having its lower end connected to the opposite end of the lever and its upper end connected to the rod upon which the gate is hung, substantially as described.

2. The combination of the gate with the casting S, diagonally secured to two of the parts of the gate and provide with a slot at one end, through which a clamping-bolt is passed, a lever pivoted to the casting, the rod upon which the gate is hung, and a rod, wire, or brace connected to the lever and the said pivotal rod, whereby the sag in the gate can be taken up, substantially as set forth.

3. The combination of the gate and the casting S, (which is diagonally secured thereto and provided with a slot at its center and a series of teeth arranged upon a circle,) with the lever R, pivoted in the slot so as to have endwise movement, and having its upper end hooked so as to engage with the teeth, the pivotal rod or bolt upon which the gate is hung, and the brace rod or wire Q, connecting one end of the lever and the pivotal rod, substantially as specified.



413,528. WHITE LEAD. RALPH W. R. MAC IVOR, London, County of Middlesex, England. Filed Aug. 14, 1888. Serial No. 282,695. (No specimens.) Patented in England July 12, 1888, No. 10,698.

Claim.—1. The process for the manufacture of white lead, consisting in the treatment of monoxide of lead with acetate of ammonia, whereby hydrate of lead is formed and the conversion of this into basic carbonate of lead by the subsequent injection of carbonic acid, substantially as herein described.

2. The process for the manufacture of white lead, consisting in submitting monoxide of lead to agitation with a solution of acetate of ammonia in a close vessel, and afterward, when the monoxide has been converted into hydrate, passing streams of carbonic-acid gas through the contents of the vessel.

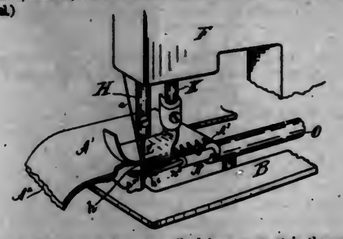
413,529. WAGON-BODY FASTENER. TABER G. MANDT, Stoughton, Wis. Filed Sept. 4, 1889. Serial No. 322,935. (No model.)

Claim.—1. In a wagon-top fastener, the combination, with the depending strip, of the case adapted to receive said strip, the spring in said case, and the cam-lever for forcing the spring against the strip to secure the same, substantially as described.

2. In a wagon-top fastener, the combination, with the strip having the depression therein, of the case having the spring, and the cam-lever for causing the spring to engage the depression and secure the strip in the case, substantially as described.

3. In a wagon-top fastener, the combination, with the strip, of

the case to receive the same, consisting of the staples, the cam-lever pivoted in one of the staples, and the spring having one end secured and the other end free and turned up or beveled slightly, substantially as and for the purpose described.



413,530. WAGON-SEAT FASTENER. TABER G. MANDT, Stoughton, Wis. Filed Sept. 6, 1889. Serial No. 323,180. (No model.)

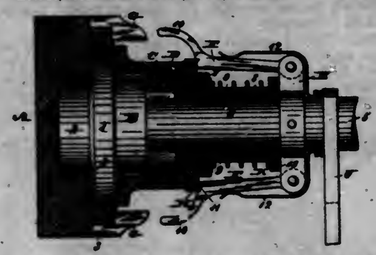
Claim.—1. The herein-described seat-fastener, comprising the following elements: a keeper having inwardly-projecting ears forming a groove, and outwardly-projecting lip, a cam-lever having a beveled flange, and a casing having a downwardly-projecting rectangular finger, substantially as shown.

2. The herein-described seat-fastener, comprising the following elements: a keeper having ears forming a groove and lip with a flat upper surface, and a curved and beveled under side, a cam-lever having a flange beveled, substantially as shown, and a segmental casing having a finger adapted to register with the rectangular groove of the keeper, all constructed and combined to co-operate, substantially as and for the purpose set forth.

413,531. METHOD OF OVERSEAMING FABRICS. JOSEPH M. MERROW, Merrow, Conn. Filed Oct. 12, 1887. Serial No. 252,153. (No model.)

Claim.—The hereinbefore-described improvement in the art of forming a seam or finish on fabrics, which consists in passing the thread through the material near the edge thereof, grasping the thread beneath the material and drawing a loop to or beyond the edge, then grasping the thread upon the upper side of the material and drawing a loop therefrom to or beyond the edge and through the preceding loop, passing the thread again through the material, grasping said thread beneath the material and drawing a loop through the second loop, and repeating the process, substantially as described.

413,532. CORN-SHELLER. GEORGE F. MERRIMAN, Tatamy, Pa. Filed Mar. 14, 1889. Serial No. 303,149. (No model.)



Claim.—1. In a corn-sheller, the combination of a shelling-cylinder, a casing for the same provided with a longitudinal shelling-breast in one side of its upper portion, heads closing the opposite ends of the casing, the rear head being provided with a cob-discharge aperture in its upper corner at or just above the rear end of the shelling-breast, and a straight slide between the end of the casing and its rear head and obliquely and adjustably extending across said opening, whereby the size of the same can be increased or diminished, substantially as described.

2. In a corn-sheller, the combination of the frame, the vibratory shoe in the lower portion of the same, a cross-bar at the front end of the frame, a vertical bell-crank lever mounted at its elbow on said cross-bar and having its upper arm pivoted to the front end of said shoe, a transverse driving-shaft mounted at the front end of the frame, an eccentric on said shaft, and a pitman extending down from the eccentric and loosely connected to the opposite arm of said lever, for the purpose set forth.

3. In a corn-sheller, the combination of a casing for the shelling-cylinder, having a longitudinal shelling-breast in one side of its upper portion, a head closing the rear end of the casing, having a cob-discharge opening in an upper corner at the end of said breast, a pair of vertical side pieces rigidly secured to said head on each side of and extending above and below the opening therein, a downwardly and inwardly inclined bottom rigidly secured to the lower edges of said side pieces and leaving a discharge-opening between its lower edge and the face of said head, and an outwardly-inclined open guide-bottom at its upper edge secured to the head beneath said opening and at the lower edge secured to the upper edge of said bottom board, as and for the purpose set forth.

4. In a corn-sheller, the shelling device, in combination with a vibratory shoe beneath the same consisting of side pieces, a pair of guide-bottoms carried by the side pieces beneath the shelling device and centrally and downwardly inclined and overlapping at their inner ends, the side pieces being extended downwardly at their rear ends, a downwardly and centrally inclined bottom secured to the lower edges of said extended sides, an open conduit carried by the shoe at the lower edge of said bottom, a riddle directly above said bottom and beneath the discharge-edge of said pair of guide-bottoms, and a vertical screen secured to the front edges of the said extended sides and extending from one edge of said conduit to and just in front of said discharge-edge, as and for the purpose set forth.

413,533. APPARATUS FOR MAKING PAPER BOXES. JULIUS MOSS, Philadelphia, Pa., assignor to Wolf Brothers, same place. Filed Nov. 30, 1888. Serial No. 291,260. (No model.)

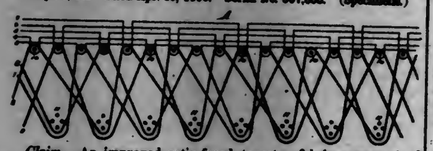
Claim.—1. A die and a plunger, in combination with a stripper movably connected with the rod of said plunger and a spring bearing against said stripper, and a cup or holder surrounding the plunger, substantially as described.

2. A die and a plunger, in combination with a cup or holder and a stripper therein, said holder and stripper being movably connected with the rod of the plunger, and arms pivoted to said rod and adapted to engage with the holder, thus advancing said holder with the plunger, substantially as described.

3. In an apparatus for making paper boxes, the plunger-rod B, the cup or holder C, and the stripper D between said holder and plunger, movably connected with said rod, in combination with the spring K, bearing against said holder and stripper, and the cross-head E, against which said stripper is stopped, whereby the spring is compressed, substantially as described.

4. In an apparatus for making paper boxes, a die, a plunger, and holder, in combination with arms pivoted to the rod of the plunger, a shoulder on the holder with which said arms abut, and deflectors on the bed or die, the ends of the arms being set out so as to engage with the deflectors, and thus form throw-offs, whereby the arms are disconnected from the holder.

5. A die and a plunger, in combination with a holder and an inclosed stripper surrounding said plunger, said holder having connected with it a screw which passes through a slot in the neck of the stripper and enters a recess in the plunger-rod, substantially as described.



6. A die and plunger, in combination with a stripper, which is movably connected with the plunger-rod, the outer edge of the die being rounded or beveled, whereby the front end of the stripper forms a shear with the wall of the die, substantially as described.

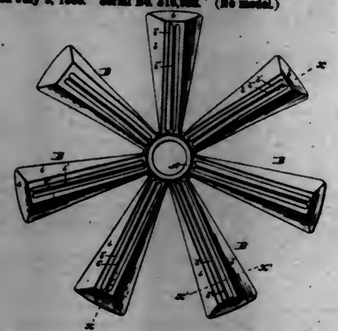
7. A die and a plunger, in combination with a cup-shaped holder,

a spring bearing against the neck of said stripper and the end of the holder, a cross-head connected with the rod or stem of the plunger, a stationary arm against which the neck of the stripper abuts, and a screw, which is connected with the holder, passes through the slot in the stripper and enters a recess in said rod or stem, substantially as described.

8. A die, a plunger having the recess 6 and provided with the cross-bar E and arms F, the latter connected to said cross-bar, the stripper D, with slots 9 and stop 13, the cup C, with screw 7, the spring K, and the stationary arm J, said parts being combined substantially as described.

413,534. SATIN-FACED FABRIC. REINARD B. MORRELL, Philadelphia, Pa. Filed Apr. 19, 1889. Serial No. 307,833. (Specimens.)

Claim.—An improved satin-faced tapestry fabric composed of face warp threads, backing-warp threads, fine pick threads, and backing-weft threads, the face-warp threads being floated to form a satin surface, and bound by the fine pick threads, and the backing-weft threads being bound to the fine pick threads by the backing-warps, said backing-weft threads giving body and substance to the backing, substantially as set forth.



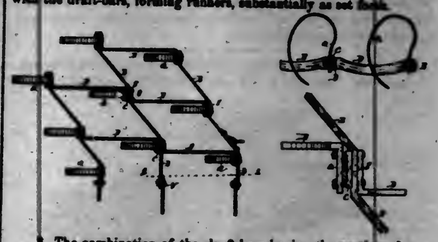
413,535. MIXTURE FOR REFINING COPPER AND ITS ALLOYS. GEORGE G. MULLER, Los Angeles, Cal. Filed Aug. 6, 1888. Serial No. 319,889. (No specimens.)

Claim.—The mixture of silica, fluor-spar, carbonate of potash, and tungstate of sodium, in substantially the proportions set forth, to be used to cleanse, refine, and improve copper and its alloys.

413,536. METHOD OF REFINING COPPER AND ITS ALLOYS. GEORGE G. MULLER, Los Angeles, Cal. Filed Oct. 3, 1888. Serial No. 326,841. (Specimens.)

Claim.—The improvement in the process of treating copper and its alloys which consists in adding to the metal a mixture of silica, fluor-spar, carbonate of potash, and tungstate of sodium, in about the proportions set forth, commingling them by melting, skimming off the dross, and then proceeding in the usual manner, as set forth.

413,537. CHURN-DASHER. JACOB W. MCCLURE, Memphis, Tenn. Filed July 9, 1889. Serial No. 316,982. (No model.)

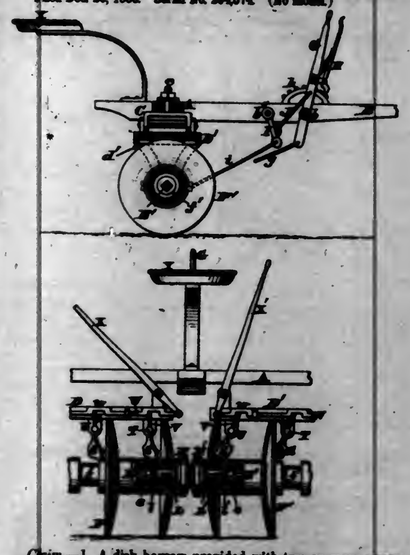


Claim.—As an improved article of manufacture, a churn-dasher constructed as follows: a hub A, having formed integral with it the radial arms B, which increase in size toward their outer ends, these radial arms being provided with radial slots *b'* and downwardly and outwardly extending flanges *b*, and radial rods *b''*, extending the entire length of the slots *b'*, as and for the purposes herein set forth.

413,538. HARROW-FRAME. JAMES MCMAHON, Kalamazoo, Mich., assignor to D. C. & H. C. Reed & Co., same place. Filed Dec. 17, 1888. Serial No. 293,259. (No model.)

Claim.—1. A harrow consisting of a series of draft-bars bearing teeth or shares and a series of cross-bars attached at the ends to said draft-bars and bowed downward, forming runners to support the draft-bars and constituting part of the frame to hold the draft-bars, substantially as set forth.

2. A harrow-frame comprising the draft-bars having share-seats and a series of cross-bars bowed downward between their attachment with the draft-bars, forming runners, substantially as set forth.



3. The combination of the draft-bars having the portions forming share-seats, the cross-bars having the angled clamping ends, said cross-bars being bowed downward between the draft-bars, teeth or shares, and bolts clamping the teeth or shares, the draft-bars, and the angled ends of the cross-bars together, substantially as set forth.

4. The combination of draft-bars, the downwardly-bowed cross-bars having the angled clamping ends, the seat-blocks, the shares, and bolts clamping the draft-bars, the ends of the cross-bars, the shares, and seat-blocks together, substantially as set forth.

5. A metal harrow-frame comprising the oblique vertically-edgewise draft-bars having the seat portions, the vertically-edgewise cross-bars bowed downward between the draft-bars and having the angled clamping ends, and the clamping-bolts, substantially as set forth.

413,539. DISK HARROW. WILLIAM H. NAUMAN, Dayton, Ohio. Filed Dec. 26, 1888. Serial No. 294,574. (No model.)

Claim.—1. A disk harrow provided with two or more gangs of disks swiveled to a main frame or beam, having their opposite ends attached to a lever in the manner described, whereby a single motion of the lever forces one end of each gang backward and the other end forward, in the manner and for the purpose described.

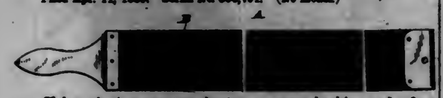
2. A disk harrow provided with two or more gangs of disks swiveled to a main frame or beam, having their opposite ends attached to a lock-lever in the manner described, whereby by a single motion of the lever one end of each gang will be forced back and the other forward and locked at any desired angle to the line of draft, in the manner and for the purpose described.

3. In a disk harrow provided with several gangs of disks or pulverizers, a lock-lever attached to the tongue and arranged to operate the disk-gangs by rods attached to their opposite ends to throw and lock them at any desired angle to the line of draft, in the manner and for the purpose described.

4. In a disk harrow having several gangs of disks arranged as described, the combination of the main lever G, attached to one end of each gang, the counter-lever I, attached to the other end of each gang, and connecting link J, in the manner and for the purpose specified.

5. A disk harrow of the class specified provided with a pair of anti-friction heads revolving independently of the gangs, applied to the abutting ends of the disk-gangs, substantially as and for the purpose described.

6. A disk harrow of the class specified provided with a pair of anti-friction heads revolving independently of the gangs, applied to the abutting ends of the disk-gangs, said heads being united by a tie, substantially as and for the purpose described.



7. In a disk harrow having one or more pairs of disk-gangs with abutting ends, the revolving anti-friction heads M M', provided with laterally-extending lugs fitting into bushings L L', with the longitudinal slots *o o'*, and chambers O O', substantially as described.

8. In a disk harrow having one or more pairs of disk-gangs whose ends abut, revolving anti-friction heads whose inner ends or stems are provided with laterally-extending annular ribs revolving in interior annular chambers or grooves within the bushing, substantially as and for the purpose described.

9. In a disk harrow, disk scrapers swiveled in rock-shafts suspended from the frame, whereby they may be adjusted to the concave faces of the disks, substantially as and for the purpose described.

10. In a disk harrow, disk-scrapers swiveled in rock-shafts T, in combination with the levers V, and sliding bar W, whereby said scrapers may be thrown into or out of contact with the disks, substantially as and for the purpose described.

413,540. RAZOR-STROP. WESLEY I. NEBOLA, New York, N. Y. Filed Apr. 11, 1889. Serial No. 306,791. (No model.)

Claim.—1. A razor-strop having a canvas backing and a face composed of rubber having fine emery mixed therewith, said rubber face being grooved in diagonal lines from the center toward each side, substantially as described.

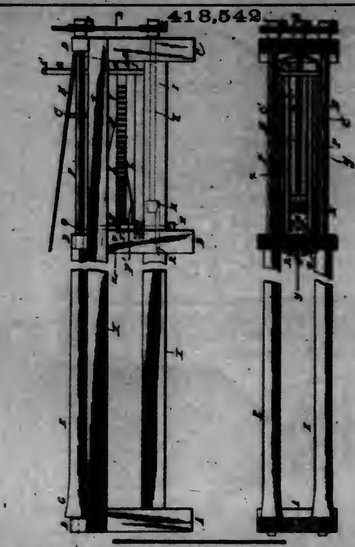
2. A razor-strop having its face formed with diagonal grooves extending from the center of the strop to each side, substantially as described.

413,541. SUSPENDER-END. WILBUR F. OSBORNE, Ansonia, Conn. Filed July 3, 1889. Serial No. 316,456. (No model.)

Claim.—As an improved article of manufacture, the flat suspender-end herein described and shown, consisting of the flattened textile core, the flat rectangular tubular braid inclosing said core and composed of a strong but inferior textile material for the requisite strength, and the flat rectangular tubular braid of superior material inclosing the flat braid containing the core, as set forth.

413,542. MACHINE FOR PITCHING BARRELS. EDWARD J. OTT, Norwalk, Ohio. Filed Oct. 23, 1888. Serial No. 288,987. (No model.)

Claim.—1. The combination, in a machine for rolling kegs, of the rollers E, the shaft N, means, substantially as specified, to rotate the said shaft and rollers, the pinion S, feathered to the shaft N and vertically movable thereon, the yoke B', connected to the pinion, and the reciprocating frame V, having the rack-bars arranged in different planes and adapted to alternately engage the pinion, said frame having the push-bar or standard, for the purpose set forth, substantially as described.



2. The combination, with the rollers E, of the pivoted yoke B', the reciprocating frame V, having the rack-bars in different planes, the revolving shaft N, the pinion feathered to and vertically movable on said shaft and adapted to alternately engage the rack-bars, the cord connecting the said pinion to the pivoted yoke, and the cam on the frame V to depress the said pinions, substantially as described.

3. In a machine for rolling kegs, the combination of the rollers, the yoke, and the traveling frame having the push rod or standard, substantially as described.

4. In a machine for rolling kegs, the combination of the rollers E, having the enlarged, swelled, or flared outer ends G, the yoke, and the traveling frame having the push-rod or standard, substantially as described.

5. In a machine for rolling kegs, the combination, with the continuously-revolving rollers and shaft N, of the traveling frame having the push-bar or standard, the pivoted yoke, and the pinion feathered on the shaft, adapted to operate the traveling frame, and the connections between said pinion and said yoke, substantially as described.

413,542.

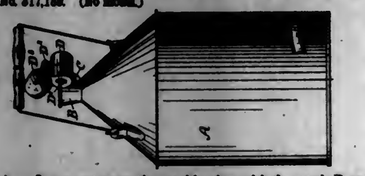
413,543. WRINGER. LEWIS C. PARKER, Cincinnati, Ohio, assignor to the Peerless Wringer and Manufacturing Company, same place. Filed Mar. 13, 1889. Serial No. 303,182. (No model.)

Claim.—In a wringer, the combination, with the posts A A, of circular grooved guides B B and a curved apron C, having the notches *c c* at the corners, and arranged to operate substantially as and for the purpose specified.

413,544. RECEPTACLE FOR RETAILING NAILS. JOHN G. PEACH, ELBRIDGE I. DYE, and ISAAC DYE, Salem, Mo. Filed Apr. 11, 1889. Serial No. 306,784. (No model.)

Claim.—1. The receptacle for retailing nails, having an inclined bottom, a discharge-orifice in the front wall at the lower part of the bottom, and a drop-gate 7, having tines 9 and adapted to close the discharge-orifice, substantially as set forth.

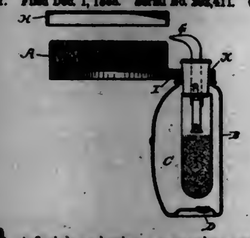
2. The receptacle for retailing nails, having an inclined bottom 4 6, a discharge-orifice 5, a forked drop-gate 7, and an inclined cover 13, all constructed and arranged substantially as set forth.



413,545. RIBBON-REEL. WILLIAM G. PEACOCK and JAMES W. CROMAN, Tiptonville, Tenn. Filed July 15, 1889. Serial No. 317,601. (No model.)

Claim.—In a ribbon-reel, the spring-clamp consisting of a strand of wire whose ends have their bearings in central orifices on either side of the bolt, the wire strand in continuation on either side of the bolt being projected outwardly to near its periphery where formed into coiled springs, and from thence projected near the center of the bolt and across the wire, and again bent at right angles near the periphery

of the bolt with which it is aligned, substantially as and for the purpose set forth.



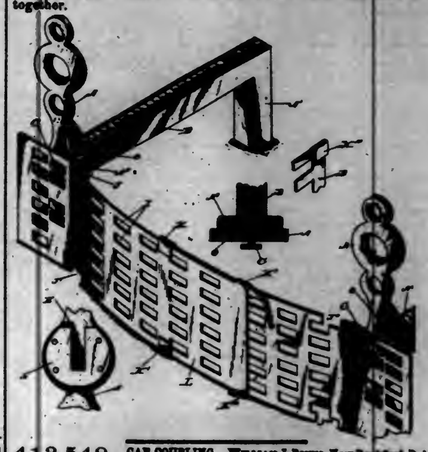
418,546. CAN-STOPPER. HENRY PEARL, Mount Vernon, assignor of one-half to Leopold Weil, New York, N. Y. Filed July 11, 1889. Serial No. 317,169. (No model.)

Claim.—In a can-stopper, the combination, with the nozzle B, provided with the arm C, carrying the barrel D, of the spring-actuated barrel D', journaled on the barrel D and provided with the stopper D^2, and the actuating-spring carried by said barrels, substantially as described.

418,547. MAGNESIUM FLASH-LAMP. HENRY G. PIFFARD, New York, N. Y. Filed Dec. 1, 1888. Serial No. 292,411. (No model.)

Claim.—1. A flash-lamp having a magnesium-receptacle, a bulb within which said receptacle is located, and which serves as a hand-grasp, an air-induction tube extending to the interior of said bulb, an ejector-tube leading therefrom, and a flat alcohol-lamp attached to the neck of said bulb, substantially as described.

2. A flash-lamp having a magnesium-receptacle located within a bulb which serves as a hand-grasp, an air-induction tube extending into said receptacle, an ejector-tube extending therefrom, a flat alcohol-lamp detachably secured to the neck of said bulb, the nozzle of said ejector being deflected at an angle to said receptacle and parallel to the surface of the lamp, substantially as described.



3. As a new article of manufacture, a magnesium flash-lamp having a magnesium-receptacle, a bulb to which said receptacle is attached, and which serves as a hand-grasp, an air-induction tube extending into said receptacle, an ejector-tube leading therefrom, and a flat alcohol-lamp attached to the neck of the bulb, as and for the purpose described.

418,548. FIRE-FENDER AND ANDIRON. GEORGE W. PITTS, Oxford, Ala., assignor of one-half to William J. Pearce. Filed Oct. 5, 1888. Serial No. 287,393. (No model.)

Claim.—1. The combination, with a pair of andirons, of a fender detachably secured to the front face thereof, and provided with registering apertures of less width than the spaces between them, and each sliding horizontally in suitable supports upon the other, whereby slightly adjusting the sheets may simultaneously close all the apertures.

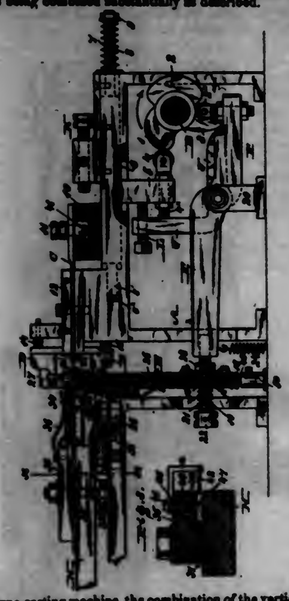
2. The combination, with the corrugated andirons, of a fender consisting of two overlapped perforated sheets removably fixed to the andirons, respectively, and each guided by supports upon the other, whereby slight movement of the andirons themselves toward or from each other may close the apertures.

3. The combination, with a pair of andirons, of the overlapped perforated sheets D D', each provided with hooks engaging the edges of the other, and having notches in said edges at normally-unequal distances from said hooks, respectively, whereby the hooks may be successively engaged with the corresponding edges in putting the parts together.

418,549. CAR-COUPLING. WILLIAM J. POSTO, New Rockford, Dak. Filed July 11, 1889. Serial No. 317,112. (No model.)

Claim.—1. The draw-head B, having slots *b* and *b'*, the bolt C, and plate *c*, connected to it, and the spring F behind the bolt, whereby the pin is held up by means mostly outside the mouth of the draw-head.

2. The combination, with the draw-head having its upper pin-hole provided with lateral opposite extensions, of the sliding plate *c*, to uphold the pin, the pin having lateral opposite fins to fit in said extensions, and the coupling-link, which, when in the draw-head, is horizontally held by the said pins which bear on its opposite side bars, substantially as specified.



3. The combination, with the draw-head having the slots *b b'* and provided with an upper pin-hole having opposite lateral extensions, the bolt C, the spring F in rear of said bolt, and the sliding plate *c*, attached to the bolt, of the coupling-link and the pin D, having opposite lateral fins *d*, substantially as specified.

418,550. TYPE-CASTING MACHINE. HERMANN PUSS, Philadelphia, Pa. Filed Dec. 28, 1888. Serial No. 295,111. (No model.)

Claim.—1. In a type-casting machine, a frame with a slide working therein, said slide having a depending arm, a rotary shaft with cam, a head on said slide, a plunger secured to said head, a bed in which said plunger works, a mold with casting-chamber, and a vertical slide forming one side of said casting-chamber opposite the plunger, said parts being combined substantially as described.

2. A frame, a slide working in said frame and having an end rod and a depending arm, returning-spring on said rod, and a rotary shaft with a cam adapted to engage said arm, said parts being combined substantially as described.

3. A frame, a slide working in said frame and having a depending arm with a roller, a rotary shaft with a cam adapted to engage said roller, a plunger adjustably secured to said slide, a bed in which said plunger works, a mold with a casting-chamber, a vertical slide adapted when raised to form one wall of the chamber and when lowered to have its top level with the bottom or floor of the casting-chamber, said parts being combined substantially as described.

4. In a type-casting machine, the combination of the vertical slide, the lever for operating the same, the universal joint between the lever and slide, the spring carried by a rod on the end of the lever and bearing against the universal joint, and the spring for restoring the said lever, substantially in the manner and for the purpose described.

5. In a type-casting machine, a slide with an adjustable plunger, a bed in which said plunger works, a mold with charging-chamber, a vertical slide forming the side of the chamber opposite the plunger, a receiving-table on the level of the charging-chamber, the said plunger working in the bed and through the charging-chamber, said parts being combined substantially as described.

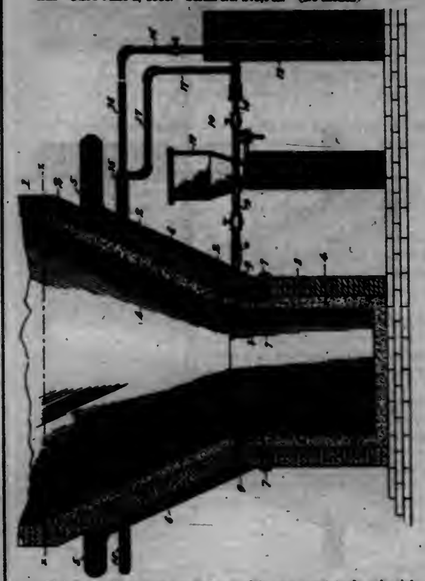
6. In a type-casting machine, a slide with an adjustable plunger secured thereon and having a downwardly-projecting arm, a pivoted lever with an adjustable pin or stud adapted to engage said arm, and a rotary shaft with a cam adapted to engage said lever, said parts being combined substantially as described.

7. In a type-casting machine, the combination, with the plunger and means for operating the same, of the lever for engaging said plunger, and a cam for operating said lever, substantially in the manner and for the purpose described.

8. In a type-casting machine, a mold having a discharge-passage leading therefrom, in combination with a screw at one side of the mold, having its point projecting therein, and a guide-plate at the opposite side of said mold, substantially as and for the purpose described.

9. In a type-casting machine, the herein-described means for breaking the jet, consisting of blocks having inclined faces arranged in opposite or reverse directions, substantially as described.

10. In a type-casting machine, a mold and a discharging-table, in combination with a slide having a flat top, which when the slide is in normal position is coincident with the bottom of the casting-chamber of said mold and top of said table, and when moved forms one side of said casting-chamber, substantially as described.



11. In a type-casting machine, the combination of the table H, a plunger, the separating-plate 37, the block 35 with recess 44, the block 43, secured in said recess and having the rib 47, substantially as and for the purpose set forth.

12. In a type-casting machine, the combination of the slide carrying a plunger, the cam for operating said slide, the spring for returning the slide, the stop for limiting and adjusting the movement of the slide, the lever for engaging the slide to prevent sticking of the same, and the cam for operating said lever, substantially as and for the purpose described.

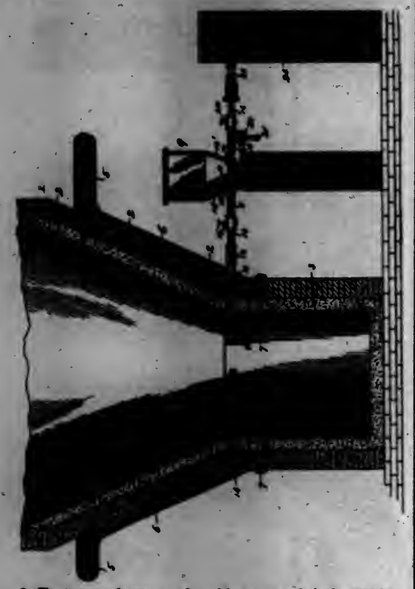
13. In a type-casting machine, a slide with head having a wedge-shaped nut secured thereto, and a plunger secured to said nut by a screw, said parts combined substantially as described.

14. In a type-casting machine, the slide having the head rising therefrom and the arm depending therefrom, the plunger connected to said head, and the cam and lever, with means, substantially as described, to operate the same against the depending arm of the slide, substantially in the manner and for the purpose described.

418,551. APPARATUS FOR SMELTING ORES. NATHANIEL A. PRATT, Atlanta, Ga., assignor to the Pratt Steel Company, Birmingham, Ala. Filed June 2, 1888. Serial No. 275,942. (No model.)

Claim.—1. In an apparatus for smelting ores and dephosphorizing and otherwise purifying and refining the molten metal, the combination, with a blast-furnace provided with a basic lining for its bosh and crucible, of an apparatus for feeding finely-comminuted basic flux into the lower part of the bosh at or near the zone of fusion, substantially as described.

2. In an apparatus for smelting ores and dephosphorizing and otherwise purifying and refining the molten metal, the combination, with a blast-furnace provided with a basic lining for its bosh and crucible, of a series of flux-feeders arranged around said furnace for feeding finely-comminuted basic flux thereto and having their nozzles entering the lower part of the bosh a short distance above the tuyeres, substantially as described.



3. In an apparatus for smelting ores and dephosphorizing and otherwise purifying and refining the molten metal, the combination of a blast-furnace provided with a basic lining for its bosh and crucible, and with flux-nozzles around the lower part of its bosh, with feeders arranged to register with said nozzles and provided with movable couplings for connecting them therewith, substantially as described.

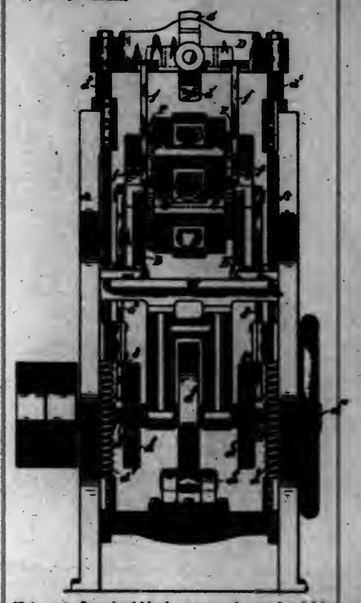
4. In an apparatus for smelting ores and dephosphorizing and otherwise purifying and refining the molten metal, the combination of a blast-furnace provided with a basic lining for its bosh and crucible, and with flux-nozzles arranged around the lower part of its bosh, with feeders or injectors arranged to register with said nozzles and provided with delivery-pipes and movable couplings for connecting them with said nozzles, and a compressed-air-supplying reservoir for forcing said flux through said nozzles, substantially as described.

418,552. PROCESS OF SMELTING IRON ORES. NATHANIEL A. PRATT, Atlanta, Ga., assignor to the Pratt Steel Company, Birmingham, Ala. Filed June 2, 1888. Serial No. 275,943. (No specimens.)

Claim.—1. The improved process of smelting ores and dephosphorizing and otherwise purifying and refining metal in a single blast-furnace, which consists in smelting the ore in the presence of a basic lining, in shielding the ore and molten metal from contact with silicious or other acids, and in introducing finely-comminuted basic flux at or near the zone of fusion and into direct contact with the globules or small bodies of molten metal while being smelted, substantially as described.

2. The improved process of smelting ores and dephosphorizing and otherwise purifying and refining metal in a single blast-furnace, which consists in smelting the ore in the presence of a basic lining, in shielding the ore and molten metal from contact with siliceous or other acids, and in introducing finely-comminuted basic flux at or near the zone of fusion and into direct contact with the globules or small bodies of molten metal while being smelted, substantially as described.

3. The improved process of smelting ores and dephosphorizing and otherwise purifying and refining metal in a single blast-furnace, which consists in smelting the ore in the presence of a basic lining and at the lowest temperature compatible with fusion, and in introducing finely-comminuted basic flux at or near the zone of fusion and into direct contact with the globules or small bodies of metal while being smelted, substantially as described.



4. The improved process of smelting ores and dephosphorizing and otherwise purifying and refining metal in a single blast-furnace, which consists in smelting the ore in the presence of a basic lining and at the lowest temperature compatible with fusion, and in shielding or guarding the ore and metal from contact with siliceous or other acids, and in introducing finely-comminuted basic flux at or near the zone of fusion and into direct contact with the globules or small bodies of molten metal while being smelted, substantially as described.

5. The improved process of smelting ores and dephosphorizing and otherwise purifying and refining metal in a single blast-furnace, which consists in smelting the ore in the presence of a basic lining and in introducing the blast at the zone of fusion, and in introducing finely-comminuted basic flux at or near the zone of fusion above said blast and into direct contact with the globules or small bodies of molten metal while being smelted, substantially as described.

6. The improved process of smelting ores and dephosphorizing and otherwise purifying and refining metal in a single blast-furnace, which consists in smelting the ore in the presence of a basic lining, in shielding or guarding the ore and metal from siliceous and other acids, in introducing the oxidizing-blast at the zone of fusion, and in introducing finely-comminuted basic flux at or near the zone of fusion above said blast and into direct contact with the globules or small bodies of molten metal while being smelted, substantially as described.

7. The improved process of smelting ores and dephosphorizing and otherwise purifying and refining metal in a single blast-furnace, which consists in smelting the ore in the presence of a basic lining and at the lowest temperature compatible with fusion, in omitting the admixture of flux with the ore and fuel at the top of the stack, in shielding or guarding the ore and metal from siliceous and other acids, in introducing the oxidizing-blast at the zone of fusion, and in introducing finely-comminuted basic flux at the zone of fusion at or above said blast and into direct contact with the globules or small bodies of molten metal while being smelted, substantially as described.

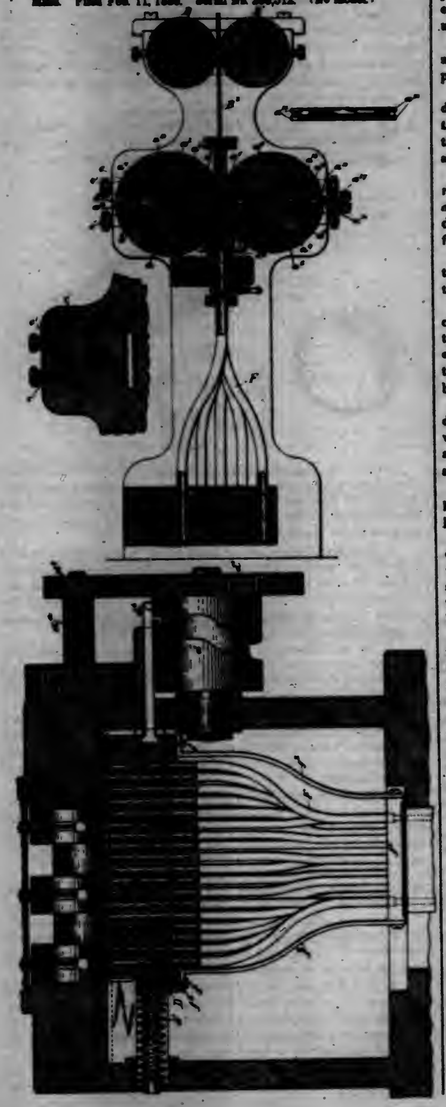
418,558. HEEL FORMING AND LOADING MACHINE. FREDERICK F. RAYMOND, 24, Newton, Mass. Filed Mar. 8, 1888. Serial No. 266,577. (No model.)

Claim.—1. In a heel-blank compressing and pricking machine, the combination of a solid die-block C, having a die-cavity with an enlarged mouth and perforations or holes in its bottom, through which the awls are adapted to be driven, a support for the die-block, a heel-former, and means, as set forth, for operating the same—such as a cam—and suitable connecting mechanism, substantially as described, whereby it is moved toward the cavity of the die and then held stationary, and a gang or group of awls movable to enter the holes of the die-block while the heel-blank is held compressed in the cavity thereof by the former, as and for the purposes described.

2. In a heel-blank compressing and pricking machine, the combination of a solid die-block C, having a die-cavity with an enlarged opening and a bottom having holes or perforations through which the awls are driven, a holder for the die-block, as set forth, a heel-former, a cross-head carrying said former, a cam of the construction set forth for imparting to said cross-head a movement toward the die-block and then holding it stationary for a period of time, a head carrying a block supporting a gang or group of awls upon the side of the die-block opposite that upon which the heel-former is located, and an actuating apparatus connected with the cross-head supporting the heel-seat former, and the cross-head supporting the awl-carrying block, constructed to provide the cross-heads with movements in relation to each other and to the die-block, as specified, and for the purpose described.

3. The combination of the die-block carrier C, the dies C', carried thereby, the cross-head E, the awl-block e, and the awls d', supported thereby, the shaft d^3, the cams d^3 and e^2, connected with the cross-head E and adapted to impart motion to the cross-head and to the awls, as specified, substantially as described.

4. The combination of the rotary die-carrier C, having the cavity c^2, the dies C', supported thereby, the former or compressor d^7, controlled as to the time of its operation by a cam, and said cam, the cross-head E, arranged in the cavity c^2 of the die-carrier, the awl-block e, and awls d', carried thereby, and one or more cams for governing the time of movement of said cross-head E relatively to that of the heel-seat former or compressor d^7, substantially as described.



5. The combination of the die-carrier C, having the interior cavity c^2, and the trunnions c, with the brackets B and the dies C', supported by said carrier, substantially as described.

6. The combination of a pressure-block or former d^7, means for imparting to it alternate movements of reciprocation and rest—such as a cam—a reciprocating gang of awls arranged opposite the pressure-block or former to co-operate therewith upon the same heel, and a heel-blank carrier having a number of heel-blank holders, and means for providing it with a progressive movement in one direction to bring each holder in successive order to a position between the pressure-block or former and the awls, substantially as described.

7. The combination of the cross-head D, the former or pressure-block d^7, the lower cross-head d^5, the connecting-rod d^6, the cam d^3, with the cross-head E, the cams e^2, the connecting-rod e^3, and the gang or group of awls d', and the rotary carrier C, the heel-holder C', supported thereby, the ratchet-wheels F, the pawls f, and the slide-rod f', connecting them with the head D, substantially as described.

8. The combination of a reciprocating pressure-block or former, a reciprocating gang of awls, a heel-blank carrier, and automatic mechanism, substantially as described, to provide the carrier with a progressive movement in one direction to carry heel-blanks in successive order to a position between the pressure-plate or former and the awls, substantially as described.

413,554. NAIL-MACHINE. FREDERICK F. RAYMOND, 24, Newton, Mass. Filed Feb. 11, 1889. Serial No. 299,512. (No model.)

Claim.—1. In a nail making and distributing machine, the combination of nail-making devices of the character specified with a horizontally-movable nail-receiving block having its nail-receiving holes brought into close proximity with the said nail-severing devices, whereby the nails are caused to be directly delivered from the nail-severing devices into the holes of the nail-receiver, as and for the purposes described.

2. The combination of one or more sets of rotary nail pointing and severing rolls arranged upon the same line with a nail-receiving block having a progressive or reciprocating movement upon a line at right angles to the rotation of the dies, and having a section or sections of the block extended between the lower sections of the die rolls or supports, whereby the nail-receiving hole or holes of said block are brought into close proximity to the severing devices, substantially as described.

3. The combination of a pair of rolls, two or more sets of nail-pointing dies carried by said rolls, and the nail-severing device for each set of dies, whereby each revolution of the rolls forms two or more nails, as and for the purposes described.

4. The combination of a pair of rolls and two or more sets of nail-pointing dies mounted thereon, whereby each rotation of the roll points two or more nails, as and for the purposes described.

5. The combination of the rolls a a^3, the two sets of pointing-dies a^3, carried by the roll a, two sets of pointing-dies a^4, carried by the roll a^3, and the feeding devices actuated to feed the wire between the operation of each set of dies a^3 a^4, as and for the purposes described.

6. The combination of the rolls a a^3, two sections a^3 of dies carried by the roll a, the two sections a^4 of the dies carried by the roll a^3, the feed-rolls B B', and the gears b b', and intermediate operating devices connecting the gear b' with a ratchet-wheel upon one of the feed-roll shafts, substantially as described.

7. The combination of a roll a, the sections a^3 of two dies mounted thereon, with the roll a^3, and the two sections a^4 of a die mounted thereon, and a severing device for each die, substantially as described.

8. The combination of the roll a, the two sections a^3 of two dies carried thereby, the roll a^3, the two sections a^4 of two dies carried thereby, and a rod or bar carried by the said roll a^3, having a cutting-edge at each end and movable in the said roll by means of the projections thereon, and a cam with which the projections are successively brought in contact, substantially as described.

9. The combination of the roll a, having two sections a^3 of two dies mounted thereon, and the pressers or sections of the severing devices a^5 a^7, the roll a^3 and the two sections a^4 of dies mounted thereon, and the severing devices a^6 a^8, one for each die, substantially as described.

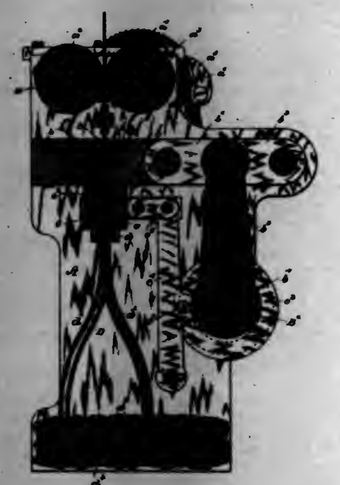
10. The combination of the nail-receiving block D and the imperforate transversely-movable hole-covering plate E, as and for the purposes described.

11. The combination of the nail-receiving block D, having a series of holes formed therein, the hole-covering plate E, and actuating devices of the character specified automatically opening and closing the same, whereby the plate is moved to uncover the holes at the end of the movement of the nail-receiving block and to close the same at the beginning of said movement, substantially as described.

12. The combination of the movable nail-receiving block D, the imperforate hole-covering plate E, the rod e^9, supported by the block D and movable relatively to it and connected with the slide-plate by one or more rock-levers, and said rock-levers, substantially as described.

13. The combination of the movable nail-receiving block D, the imperforate hole-covering plate E, the rod e^9, supported by the block D and movable relatively to it, and connected with the slide-plate by one or more rock-levers, and said rock-levers, and a spring e^{10}, substantially as described.

14. The combination of the movable nail-receiving block D, the imperforate hole-covering plate E, the rod e^9, supported by the block D and movable relatively to it, and connected with the slide-plate by one or more rock-levers, said rock-levers, a spring e^{10}, and an adjustable stop e^9, substantially as described.



15. The combination of the nail-receiving block D, having a step-by-step movement imparted to it, devices for feeding one or more nails thereto, and a distributer attached to said block to be movable therewith, substantially as described.

16. The combination of devices for making and delivering nails to a nail-receiving block, said nail-receiving block having a step-by-step movement imparted to it in one direction, a distributer attached to or carried by said nail-receiving block, and a nail-carrier G, substantially as described.

413,555. NAIL MAKING AND DISTRIBUTING MACHINE. FREDERICK F. RAYMOND, 24, Newton, Mass. Filed Feb. 11, 1889. Serial No. 299,513. (No model.)

Claim.—1. The combination, in a nail making and distributing

machine, of the swaging-dies B B' a wire-feeding mechanism for feeding wire thereto, the cut-off block C, having one or more nail-receiving holes *c*, arranged to operate in relation to the dies B B' as specified, all substantially as described.

2. The combination of the swaging-dies B B', wire-feeding mechanism, the nail-receiving and cut-off block C, and the nail-distributer D, substantially as described.

3. The combination of the swaging-dies B B', the wire-feeding mechanism, the nail-receiving and cut-off block C, the nail-distributer D, and the nail-carrier d^3, substantially as described.

4. The combination of a gang or group of sections B of swaging-dies, the gang or group of sections B' of swaging-dies, mechanism for simultaneously operating the same, a wire-feeding mechanism for feeding a group of wires, one to each pair of swaging-dies, a nail-receiving and cut-off block C, having the holes *c*, and mechanism for imparting to it horizontal movement relatively to the dies and while they are in their lowest position, substantially as described.

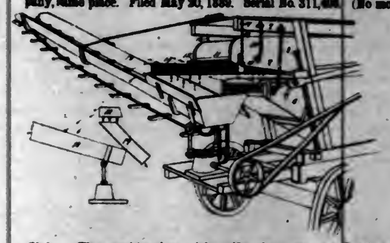
5. The combination of a gang of swaging-dies B B' and mechanism for simultaneously operating the same, wire-feeding mechanism for simultaneously feeding a gang of wires to the swaging-dies, the nail-receiving and cut-off block C, having holes *c*, and the distributer D, substantially as described.

6. The combination of a gang of sections B of swaging-dies mounted upon a common support *b*, the gang of sections B' of swaging-dies mounted upon the support b^2, and a crank b^4 and connecting mechanism for operating said dies simultaneously, substantially as described.

7. The combination of the sections B of swaging-dies and their support *b*, the sections B' of swaging-dies and their supports b', the shaft B^2, the crank b^4 and operating mechanism to operate said swaging-dies, a cam c^2 upon the said shaft B^2, the nail-receiving and cut-off block C, and mechanism connecting the cam with the block, whereby upon the end of the swaging movement of the dies the cut-off block is caused to be operated to sever the gang of nails while the wires are held by the swaging-dies, substantially as described.

8. The combination, in a nail-making machine, of two series or groups of swaging-dies B B', adapted for simultaneous operation upon a group or gang of nail blanks or wires, substantially as described.

9. The combination of the gangs or groups of swaging-dies B B', adapted for conjoint operation upon a series of nail rods, bars, or wires, with an intermittent rod, bar, or wire feeding mechanism for simultaneously feeding a series of nail-forming rods, wires, or bars to the swaging-dies, substantially as described.



10. The combination of the swaging-dies B B' with the distributer D, substantially as described.

11. The combination of the swaging-dies B B', the distributer D, and nail-carrier d^3, substantially as described.

12. The combination of the swaging-dies B B' and the cut-off block C, substantially as described.

13. The combination of the swaging-dies B B', cut-off C, and distributer D, substantially as described.

413,556. SHUCK-CORN SHELLER. WILLIAM H. REEDER, St. Louis, Mo., assignor to the Kingsland & Douglas Manufacturing Company, same place. Filed May 20, 1889. Serial No. 311,498. (No model.)

Claim.—The combination, with a vibrating separator 9, of a series of curved fingers 14, a shaft 15, carried at the rear of said vibrating separator, from which shaft said fingers extend, arms 16, rigidly secured to said shaft and pivotally affixed to a stationary part of the machine, and side boards 12 and 13, extending from said vibrating separator, for the purpose described.

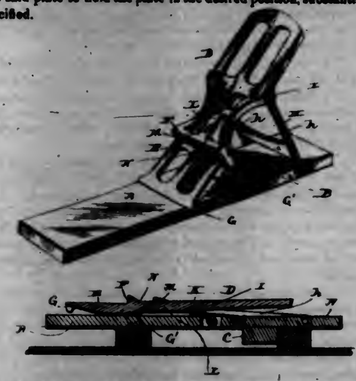
413,557. CARRIER FOR PNEUMATIC TRANSIT APPARATUS. GEORGE RENFORD, JOHN G. RENFORD, and MARTIN O. RENFORD, Philadelphia, Pa. Filed Jan. 16, 1889. Serial No. 296,471. (No model.)

Claim.—1. The combination of the body of the carrier, consisting of a cylinder open at one end, with an eccentrically-pivoted head swinging over the open end of said body to close the same, and having a retaining-catch for engaging with a rib or projection on said carrier, substantially as specified.

2. The combination of the body of the carrier, consisting of a strip of sheet metal bent into cylindrical form and retained by a longitudinal rod, with a cap for closing the open end of the cylinder, said cap being secured or hung to the longitudinal retaining-rod of the cylinder, so that the latter serves as the axis on which the cap swings in opening and closing the carrier, substantially as specified.

3. The combination of the body of the carrier, open at one end, with the swinging cap having a segmental flange engaging with a rib at the end of the carrier-body and serving to retain the cap in the closed position, substantially as specified.

4. The combination of the sheet-metal disk of the carrier-head, the threaded studs projecting from said disk, the bumper-block, and the screws or bolts adapted to the threaded studs and serving to confine said bumper-block to the sheet-metal disk of the head, substantially as specified.



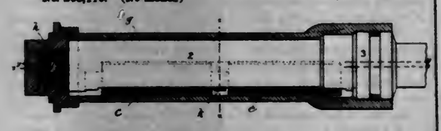
5. The combination of the body of the carrier, open at one end, with the pivoted head free to swing laterally, so as to open and close the end of the carrier, and a spring-catch radially guided on said head and engaging with a shoulder or rib on the body of the carrier, substantially as specified.

413,558. FOOT-BRACE FOR ROW-BOATS. WILLIAM H. REED, Addison, N. Y. Filed Oct. 27, 1883. Serial No. 290,267. (No model.)

Claim.—1. The foot-rest D, having a convex under side, whereby its toe may be elevated by depressing its heel, in combination with the base-board A, and the brace H, pivoted to said base-board and to said foot-rest near its toe, substantially as specified.

2. In a foot-rest, the combination, with the base-board, of the foot-plate, the swinging link connecting the foot-plate near its front end with the base-board, and the limiting arm or loop pivoted to the base-board and sliding at its free end on a longitudinal bar of the foot-rest, substantially as described.

3. In a foot-rest, the combination, with the base-board, of the foot-plate connected to the base-board by the swinging link H, the depending guiding-ears on the foot-plate engaging opposite edges of the base-board, and the limiting arm or loop M, pivoted to the base-board, sliding at its free looped end on a central longitudinal bar L of the foot-plate and adapted to engage or bear against a shoulder N on the said plate to hold the plate in the desired position, substantially as specified.



4. In a foot-rest, the combination, with a suitable base-board, of the foot-plate provided with a heel-plate bearing on the said base-board and elevated above the same at its free or rear end, and the link H, connecting the front end of the foot-plate to the base-board, substantially as specified.

5. In a foot-rest, the combination, with a suitable base-board, of the foot-plate provided with a heel-plate having its under side curved or rounded upwardly toward its free or rear end, the depending guiding-ears on the heel-plate, the swinging link connecting the front end of the foot-plate to the base-board, and the limiting arm or loop pivoted to the base-board and sliding at its free end on a longitudinal bar on the foot-plate and adapted to engage a shoulder N at one end of the said bar, substantially as specified.

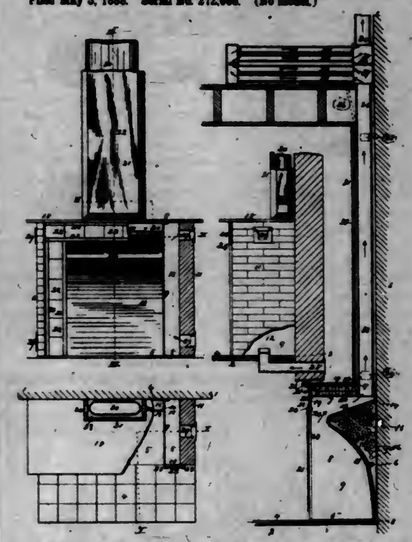
6. In a foot-rest, the combination of the base-board provided on its under side with a depending pin or cleat to engage a suitable socket or rib, and the foot-plate loosely connected to the base-board, substantially as specified.

413,559. CARRIAGE-AXLE. ELISHA F. ROBBINS, Cambridge, assignor to Thomas J. Clyn, Boston, Mass. Filed Dec. 10, 1888. Serial No. 293,116. (No model.)

Claim.—1. An axle-spindle composed of the end sections 3 4 and the intermediate section 2, offset from or eccentric to the end sections, and provided with the anti-friction roller *c*, which projects from the section 2, as described, combined with a box which is concentric with the end sections 3 4 and bears on the section 2 and roller *c* at diametrically-opposite points, as set forth.

2. The combination of the axle-spindle composed of end sections 3 4, the former having a beveled shoulder, and the intermediate section offset from or eccentric to the end sections and having a longitudinal recess, the anti-friction roller in said recess, and the box which is concentric with the end sections and provided with an inner beveled shoulder, substantially as set forth.

3. An axle-spindle having a longitudinal recess, a roller *c* in said recess, and a segmental slide fitted in the periphery of the spindle and arranged to retain the roller in its recess, as set forth.



413,560. BRAKE-SHOE. GEORGE B. ROSS, Buffalo, N. Y. Filed Apr. 13, 1889. Serial No. 307,161. (No model.)

Claim.—1. A brake-shoe having those portions of its face which operate on the wheel-tread or come in contact with the rail provided with a recess extending the whole length of the shoe and having inwardly-projecting portions, the points c^3 of which project from opposite sides of and slightly past the center of the groove c^4, substantially as and for the purposes described.

2. A brake-shoe having the side *c* provided with a series of openings c^5, to reduce the wearing-surface on that side of the shoe, so as to compensate for the wearing of the edge b^5 of the wheel by the action of frogs and switches, substantially as described.

413,561. FIRE-PLACE. LEWIS M. RESSEGUE, Spring Park, Minn. Filed May 3, 1888. Serial No. 272,993. (No model.)

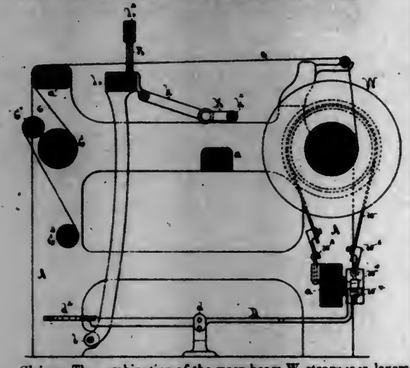
Claim.—1. A fire-place comprising the imperforate fire-sheet 13, bent substantially as shown, having the chamber 15, the side sheets 9, having the holes 16 in the chamber portions, and the crown-sheet 7.

2. A fire-place comprising the imperforate fire-sheet 13, bent substantially as shown, having the chamber 15, the side sheets 9, having the outturned edges 10 and the holes 16 in the chamber portions, the side walls 11, forming the side chambers 12, and the crown-sheet 7.

3. A fire-place comprising the imperforate fire-sheet 13, bent substantially as shown, having the chamber 15, the crown-sheet 7, the horizontal sheet 17, the front sheet 19, forming the chamber 20 in connection with the crown-sheet and the horizontal sheet, and the side sheets 9, having the holes 16 into the chamber 15 and holes 21 into the chamber 20.

4. A fire-place comprising the imperforate fire-sheet 13, bent substantially as shown, having the chamber 15, the crown-sheet 7, the horizontal sheet 17, the front sheet 19, forming a chamber 20 in connection with the crown-sheet and the horizontal sheet, the side sheets 9, having the outturned edges 10, the holes 16 into the chamber 15, and the holes 21 into the chamber 20, and the side walls 11, forming the side chambers 12.

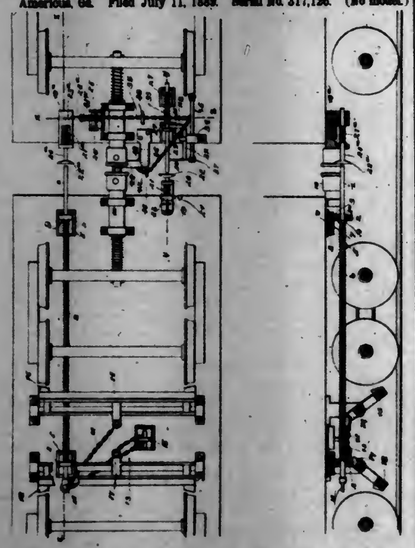
5. A fire-place comprising the fire-sheet 13, having a chamber 15, the crown-sheet 7, the horizontal sheet 17, the front sheet 19, forming the chamber 20 in connection with the crown-sheet and the horizontal sheet, the side sheets 9, having the outturned edges 10 and the holes 16 and 21, and side walls 11, forming the side chambers, the side chambers having induction and eduction openings, substantially as described.



6. A fire-place having air-spaces at the sides separated from the fire-space by sheets 9, and having openings for entrance and exit of air, and chambers 15 and 20 at the rear and top of the fire-space,

respectively, communicating with the side spaces through apertures in the side sheets 9.

413,562. PRODUCTION OF AZO COLORING-MATTER. ALFRED SARASIN, Zurich, assignor to L. Durand & Huguenin, Basle, Switzerland. Filed June 28, 1888. Renewed Sept. 20, 1889. Serial No. 324,501. (Specimens.) Patented in France Sept. 6, 1886, No. 178,364, and in England Nov. 5, 1886, No. 14,263.



Claim.—The herein-described process of obtaining coloring-matter by the reaction of a salt of the nitroso derivates of the tertiary amines, more especially nitroso-dimethylaniline upon a bioxynaphthaline whose boiling-point is about 196° centigrade, in the presence of heat and a suitable solvent, as set forth.

413,563. LOOM. CHESS A. SAWYER and MOSES M. LANUS, Lowell, Mass. Filed Mar. 25, 1889. Serial No. 304,698. (No model.)

Claim.—The combination of the warp-beam W, straps $w w$, levers w^3 w^4, pivoted lever D, having its bifurcated end engaging with the two latter levers and having the foot-pedal or end d^2, extending through underneath the loom to the other side of the breast-beam, substantially as described.

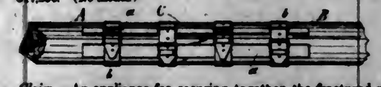
413,564. AUTOMATIC CAR-BRAKE. JOHN H. SCARBOROUGH, Americus, Ga. Filed July 11, 1889. Serial No. 317,126. (No model.)

Claim.—1. In an automatic car-brake, the combination, with the longitudinally-sliding brake-operating rod, of the rings or bearings for said rod, having upwardly-extending stems provided with blocks or plates at their upper ends, the boxes or casings having dovetailed recesses for the accommodation of said blocks or plates, and the pins or bolts to retain the said plates detachably in their respective boxes, substantially as set forth.

2. In an automatic car-brake, the combination, with the rings or bearings secured detachably to the under side of the car-body, of the longitudinally-sliding brake-setting rod mounted in said detachable bearings, the spring arranged to force the said rod automatically in a forward direction, and the chains connecting the rear end of said rod with the brake-levers, substantially as set forth.

3. In an automatic car-brake, the combination, with the brake-setting rod mounted to slide longitudinally under the front end of the car, of a buffer mounted to slide longitudinally under the rear end of the adjacent car and a transverse pin or key arranged detachably at the inner end of the stem of said buffer to prevent it from sliding in an inward direction, substantially as set forth.

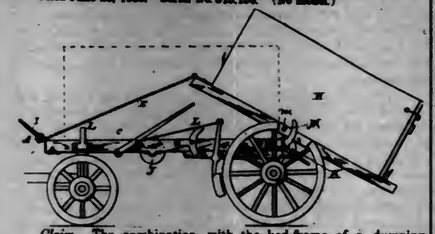
4. In an automatic car-brake, the combination of the brake-setting rod mounted to slide longitudinally under the front end of the car, a buffer arranged to slide longitudinally under the rear end of the adjacent car and adapted to engage the brake-setting rod when the cars come together while traveling in a forward direction, and mechanism to prevent the brake-setting rod being operated when the cars come together while traveling in a rearward direction, substantially as set forth.



5. In an automatic car-brake, the combination of a longitudinally-sliding frame arranged under the rear end of the car and having an outwardly-extended rod and a laterally-extending arm, a spring-buffer arranged under the front end of the adjacent car, a longitudinally-sliding rod mounted pivotally upon the laterally-extending rod of the longitudinally-sliding frame and extending inwardly to within a short distance of the rim of the adjacent car-wheel, and chains connecting the said longitudinally-sliding rod with mechanism for throwing the brake-setting mechanism out of gear by the tightening of said chains, caused by contact of the longitudinally-sliding rod with the car-wheel when traveling in a rearward direction, substantially as set forth.

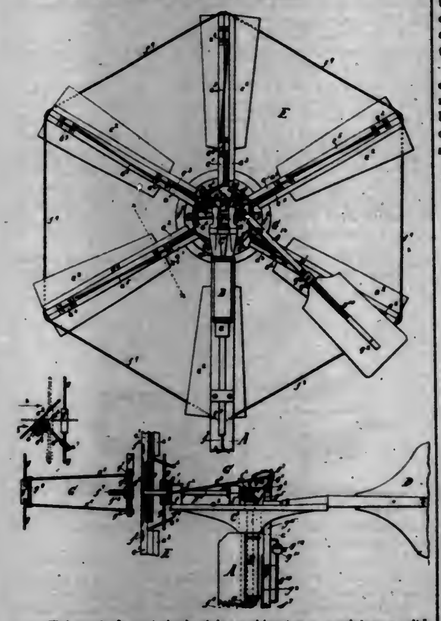
6. In an automatic car-brake, the combination of a frame arranged to slide longitudinally in bearings mounted detachably under the rear end of the car, a spring to force the said frame in an outward direction, a buffer arranged under the front end of the adjacent car, a longitudinally-sliding rod mounted in a vertically-slotted casing and extending to within a short distance of the rim of the adjacent car-wheel, the front end of said rod being mounted pivotally upon an arm extending laterally from the sliding frame, springs arranged in the vertically-slotted casing above and below the said sliding rod, and chains connecting the said longitudinally-sliding rod with mechanism for throwing the brake-setting mechanism out of gear when the cars are traveling in a rearward direction, substantially as herein described, and for the purpose set forth.

7. In an automatic car-brake, the combination of the longitudinally-sliding frame arranged under the rear end of the car, the longitudinally-sliding rod connected pivotally to an arm extending laterally from said frame, said rod extending inwardly to within a short distance of the rim of the adjacent car-wheel, springs to support the said rod normally in an approximately-horizontal position, a longitudinally-sliding buffer arranged under the rear end of the car on the opposite end of the draw-head, a transversely-sliding pin or key arranged in rear of said longitudinally-sliding buffer, a spring to hold the said key in position, a chain passing through suitable guide-eyes and connecting the said pin or key with the longitudinally-sliding rod, the brake-setting rod mounted to slide longitudinally under the front end of the adjacent car and adapted to engage the longitudinally-sliding buffer, and a buffer arranged under the front end of said adjacent car and adapted to engage the longitudinally-sliding frame, substantially as set forth.



8. In an automatic car-brake, a bracket attached to the car adjacent to the draw-head, an arm hinged to said bracket and having a block extending laterally in front of the draw-head, a spring to hold the said arm and block normally in a raised position, and mechanism adapted to be operated automatically by the movement of the car in a rearward direction for the purpose of lowering the said arm against the tension of the spring, so as to interpose the block extending laterally from the said arm between the draw-heads of the adjacent cars, which are thus prevented from coming together sufficiently close to operate the brake-setting mechanism, all combined and operating substantially as and for the purpose set forth.

413,565. DEVICE FOR SECURING BROKEN CARRIAGE-POLES, &c. BRUNO SCHEURE, Berlin, Germany. Filed July 11, 1889. Serial No. 317,256. (No model.)



Claim.—An appliance for securing together the fractured parts of carriage-poles, whiffletrees, and the like, consisting of two or more metal bars *a*, having spikes *c* on one side and connected together by straps provided with buckles *b*, said straps being fixed to one of the bars and passing through loops *d*, formed on the other bars, substantially as herein described.

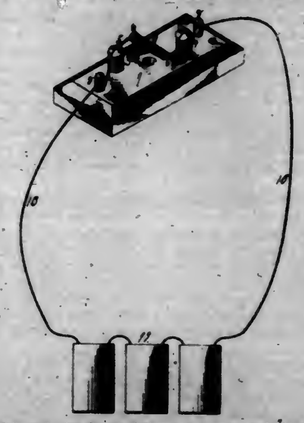
413,566. DUMPING WAGON. BERNARD SCHROEDE, Cincinnati, Ohio. Filed June 22, 1889. Serial No. 315,168. (No model.)

Claim.—The combination, with the bed-frame of a dumping wagon having the guard-arms L and the rear curved arms M secured to its side rails, the anti-friction wheels J K, turning with transverse shafts journaled in bearings secured to the side rails and with the upper parts of their peripheries about flush with the upper sides of said rails, and the shaft A, journaled in bearings secured to the front of the wagon-body, of the sliding box having lateral studs *m* and the eye-plates F, secured at the front of the box at equal distances from the sides of the body, and the rearward converging chains E, of equal length, secured at their rear ends to said eye-plates and with their front ends secured to the shaft A at equal distances from the center thereof, substantially as specified.

413,567. WINDMILL. REMUND B. SELLARD, Ogden, Iowa. Filed Feb. 25, 1889. Serial No. 301,099. (No model.)

Claim.—1. In a wind-wheel, in combination, a revolving non-sliding hub *c*, having rigid radial arms *c'*, feathering-blades c^3, attached to arms c^4 and set facewise against said arms *c'* c^3, with about one half of the width of said blades on one side and the other half on the other side of the longitudinal center of the arms c^3, hinges c^5, connecting said blades to the said arms, diagonal torsional springs c^6, fastened by one of their ends to the arms *c'* and by their other ends to the arms c^4, angular arms c^7, attached to the arms c^4, and sliding hub g', having operating-rods g, whereby the whole surfaces of the blades are at all times presented to the wind and the angle of the set of the blades can be automatically changed or regulated, and when in their normal position the blades have a square support and bearing against both of the arms *c'* c^4, and when moved out of said position are still stayed by the arms c^4, and in the event of one of the springs becoming broken the remaining ones remain operative, substantially as described.

2. In a wind-wheel, in combination, a hub *c*, having one set of rigid radial arms *c'*, another set c^4, hinged to the first set, so as to present with said arms *c'* a broad even bearing-surface, a series of feathering-blades rigidly attached about centrally of their width to the hinged set of arms, and diagonal torsional springs c^6, attached by one of their ends to the arms *c'* and by their other ends to the arms c^4, whereby the blades are afforded a broad bearing-support from both arms when in their normal position and are stayed by the arms c^4 when they are moved out of their normal positions, and at the same time are free to change their angle when the force of the wind becomes too great, substantially as described.



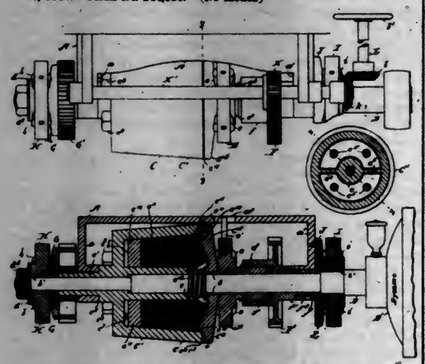
3. In a wind-wheel, in combination, hub *c*, having rigid radial arms *c'*, the undivided feathering-blades c^3, fastened by hinges c^5 and diagonal torsional springs c^6 to arms c^4 and having arms c^7, the sliding hub g', having radial rods *g*, the sliding collar g^3, connecting-rods g^5, arms g^4, bar g^7, shaft g^8, arm g^9, set oblique with respect to the vertical plane of the shaft B, and steering-vane D and carrying-vane g^6, substantially as described.

4. The connecting-rods g^5, arms g^4 g^9, sliding collar g^3, swinging bar g^7, and vane g^6, having bar g^{12}, which is attached to bracket-bar g^8, said vane being arranged obliquely on that side of the frame of the windmill where the pressure of the wind has a tendency to cause said vane to oppose or counteract the twisting force caused by the resistance of the machinery driven by the wind-wheel, in combination with the vane D and the wind-wheel E, having sails acted upon by collar g^3, substantially as described.

5. The combination of the looped weight-guide g^{10} and adjustable weight g^{11}, vane g^6, having bar g^{12} and bracket-bar c^8 and arranged obliquely on that side of the frame of the windmill where the pressure of the wind has a tendency to cause said vane to oppose or counteract the twisting force caused by the resistance of the machinery driven by the wind-wheel, said vane being connected by rods to the sliding collar which acts upon the blades of the wind-wheel, substantially as and for the purpose described.

6. The combination, with the arms g^4 g^9, bracket-bar g^8, bar g^{12}, oblique vane g^6, connecting-rods g^5, sliding collar g^3, and described connections with the blades of the wind-wheel, of the shaft g^8, swinging bar g^7, quadrant g^{13}, attached to both the shaft g^8 and bar g^7, and the connecting chain and rod f^7, substantially as and for the purpose described.

413,568. THERMOSTATIC ALARM. CHARLES H. SHAFFER, Rockford, Ill. Filed May 24, 1889. Serial No. 311,904. (No model.)



Claim.—1. An electrical thermostat composed of a base, circuit-wires connected to said base, and a detachable link of fusible alloy connecting the circuit-wires, substantially as set forth.

2. An electrical thermostat composed of a base, spring-arms secured to said base, and a link of fusible alloy connecting said arms, the said link being provided with seats for the reception of the spring-arms, and held detachably in place by the arms, substantially as set forth.

3. An electrical thermostat composed of a base, spring-arms secured to said base, a link of fusible alloy connecting the inner ends of

the arms, and the outer ends connected to binding-posts, the link being held in close electrical contact with the arms by the spring-tension of the arms, substantially as set forth.

413,569. POWER-TRANSMITTING CLUTCH. WILLIAM F. SHERMAN, Lowell, Mass., assignor, by mesne assignments, to the Sherman Electric Storage Equipment Company, of New Hampshire. Filed July 14, 1887. Serial No. 244,330. (No model.)

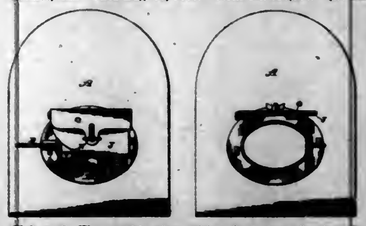
Claim.—1. A clutch having a female part provided with a somewhat elastic packing and with an annular beveled open end and a male part provided with an annular flange adapted to enter and fit said open end when said clutch is fully coupled, and provided also with an annular bevel around said flange to fit the beveled end of said female part, said packing being arranged at a distance from the open end of said female part less than the depth of said flange, in order that a partial coupling of said clutch may bring said packing and said male part in contact with each other, as and for the purpose specified.

2. A clutch having a female part provided with a packing of alternate concentric layers of leather and rubber surrounding each other and with an annular beveled open end and a male part provided with an annular flange adapted to enter and fit said open end when said clutch is fully coupled, and provided also with an annular bevel around said flange to fit the beveled end of said female part, said packing being arranged at a distance from the open end of said female part less than the depth of said flange, in order that a partial coupling of said clutch may bring said packing and said male part in contact with each other, as and for the purpose specified.

3. A clutch having a female part provided with radial partitions and with a packing of somewhat elastic material and with an annular beveled open end and a male part provided with an annular flange adapted to enter and fit said open end when said clutch is fully coupled, and provided also with an annular bevel around said flange to fit the beveled end of said female part, said packing being arranged at a distance from the open end of said female part less than the depth of said flange, in order that a partial coupling of said clutch may bring said packing and said male part in contact with each other without turning said packing in said female part, as and for the purpose specified.

4. The combination of a clutch having a female part provided with a closed end and with an annular beveled open end, and having a male part provided with an annular flange adapted to enter and fit said open end when said clutch is fully coupled, and provided also with an annular bevel around said flange to fit the beveled end of said female part, a packing arranged within said female part, plates arranged within said female part, between the closed end thereof and said packing, and adjusting-screws turning in said closed end and forcing said plates against said packing, as and for the purpose specified.

5. The combination of the frame the clutch, having a female part provided with a hub journaled in said frame, another hub journaled in said frame and provided with an internal screw-thread, a shaft turning in said hubs concentrically therewith, said clutch having a male part sliding on said shaft and rotating therewith, a non-friction wheel loose on said shaft and provided with anti-friction rolls which rest against the outer face of said male part, and provided also with an externally-threaded hub adapted to enter and engage said internally-threaded hub, whereby turning said internally-threaded hub in one direction will cause said clutch to be coupled and turning the same in the other direction will allow said clutch to be uncoupled, as and for the purpose specified.



6. The combination of the frame, the clutch having a female part provided with a hub journaled in said frame, another hub journaled in said frame and provided with an internal screw-thread, a shaft turning in said hubs concentrically therewith, said clutch having a male part sliding on said shaft and rotating therewith, a non-friction wheel loose on said shaft and provided with anti-friction rolls which rest against the outer face of said male part, and provided also with an externally-threaded hub adapted to enter and engage said internally-threaded hub, a gear secured to said internally-threaded hub, another shaft provided with a gear which engages said first-named gear, and provided also with a bevel-gear, and a vertical spindle or shaft provided at one end with a hand-wheel and at the other end with a bevel-gear, which engages said first-named bevel-gear, as and for the purpose specified.

7. The combination of the frame, the clutch having a female part provided with a hub journaled in said frame, another hub journaled in said frame and provided with an internal screw-thread, a shaft turning in said hubs concentrically therewith, said clutch having a male part sliding on said shaft and rotating therewith, a non-friction wheel loose on said shaft and provided with anti-friction rolls which rest against the outer face of said male part, and provided also with an externally-threaded hub adapted to enter and engage said internally-threaded hub, another non-friction wheel provided with anti-friction rolls, a circular plate secured to the hub of said female part outside of said frame and bearing against said last-named anti-friction rolls, and a third non-friction wheel secured to said shaft and provided with anti-friction rolls which bear against the outside of said frame at the opposite side of said frame from said circular plate to prevent an endwise movement and pressure of the shaft and to diminish the friction on said shaft, as and for the purpose specified.

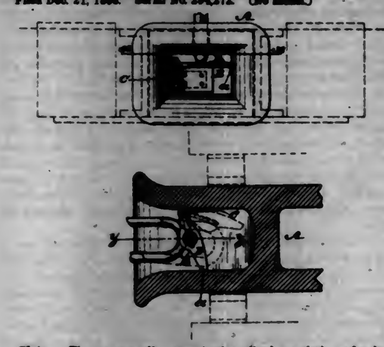
8. The combination of the car provided with wheels and axles, bevel-gears secured to said axles, a shaft arranged at right angles to said axles and provided with bevel-gears which engage said first-named bevel-gears, and provided also with a spur-gear, a clutch, a spring to open said clutch, a wheel sliding on said shaft, but not turning therewith, and having an externally-threaded hub, an internally-threaded hub which engages said externally-threaded hub, and a spur-gear secured to the driven counterpart of said clutch and engaging said first-named spur-gear, as and for the purpose specified.

9. The combination of the car provided with wheels and axles, bevel-gears secured to said axles, a shaft arranged at right angles to said axles and provided with bevel-gears which engage said first-named bevel-gears, and provided also with a spur-gear, a clutch, a spring to open said clutch, a wheel sliding on said shaft, but not turning therewith, and having an externally-threaded hub, a gear having an internally-threaded hub which engages said externally-threaded hub, a counter-shaft, a pinion fast on said counter-shaft and engaging said last-named gear, a bevel-gear fast on said counter-shaft, a vertical spindle, a bevel-gear fast thereon and engaging the bevel-gear on said counter-shaft and a hand wheel secured on said spindle, and a spur-gear secured to the driven counterpart of said clutch and engaging said first-named spur-gear, as and for the purpose specified.

413,570. SHADE FOR FURNACE-DOORS. CHARLES H. SHUTTS, Elkhart, Ind. Filed Aug. 10, 1889. Serial No. 320,357. (No model.)

Claim.—1. The combination, with a furnace or fire-box door, of an automatically-acting shade, which is raised by the opening of the door, substantially as shown.

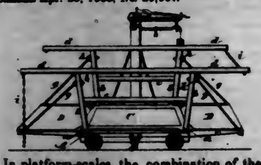
2. The combination of the door, with a shade which is rounded away at its outer lower corner, so that when the door is opened the shade is automatically raised thereby, substantially as described.



3. The combination of the door, the automatically-acting shade, and the adjusting-plate attached to the shade, substantially as set forth.

4. The combination of the furnace-door, the shade, the shade-hangers, the horizontal plate placed upon the hangers, and the adjusting-plate attached to the shade, substantially as specified.

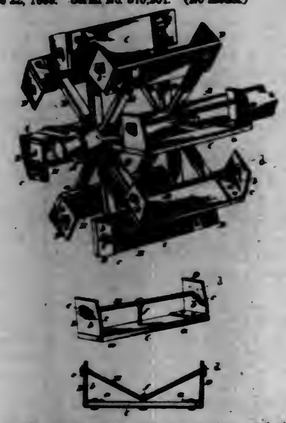
5. The combination of the shade, the shade-hangers, a spring applied to the under side of the shade, and a locking device, substantially as shown.



6. The combination of a furnace-door, a pivoted piece connected thereto, and the automatically-acting shade, substantially as described.

413,571. CAR-COUPLING. JOSEPH J. SLEEPER, Camden, N. J. Filed Dec. 21, 1888. Serial No. 294,372. (No model.)

Claim.—The car-coupling herein described, consisting of a draw-head, a swinging plate journaled within the same and having a flange adapted to sustain the coupling-pin, and extending, as at *a*, so as to come in contact with the opposite wall of the draw-head, and a spring bearing against said swinging plate, said parts being combined substantially as described.

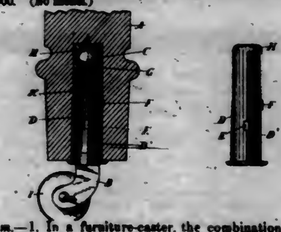


413,572. PLATFORM-SCALES. JAMES P. STEEDMAN and THOMAS PARTRIDGE, Hamilton, Ontario, Canada, and ANDREW TURNBULL, New Britain, Conn., assignors to the E. & C. Gurney Company, (Limited,) Ontario, Canada. Filed Apr. 19, 1888. Serial No. 271,193. (No model.) Patented in Canada Apr. 25, 1888, No. 29,007.

Claim.—1. In platform-scales, the combination of the platform C, extensions D D, upright posts *b b*, and rails *d d*, substantially as and for the purpose specified.

2. In platform-scales, the combination of the platform C, extensions D D, upright posts *b*, rails *d*, braces *c*, brace-rods *g*, and chains *i*, substantially as and for the purpose specified.

413,573. PROPELLER-WHEEL. PETER ST. JOHN, Milton, Vt. Filed June 22, 1889. Serial No. 315,201. (No model.)



Claim.—1. The combination, with the buckets and the flanges secured thereto, as shown, of the brace-rods connecting each pair of flanges and having provision for longitudinal adjustment, substantially as and for the purpose specified.

2. In a paddle-wheel, the combination, with the buckets, of the flanges attached thereto near the outer ends thereof and having their acting portions extending at right angles to the buckets, the brace-rods connecting each pair of flanges, and the eyebolts secured to the buckets between the flanges and supporting the rod, substantially as shown and described.

3. In a paddle-wheel, a bucket having flanges at each end, with their acting surfaces extending at right angles to the length of the bucket, combined with a brace-rod E, having its ends passed through the opposite flanges and one end provided with a nut, the said rod being inclined in opposite directions from the center, and an eyebolt embracing the rod near the center and secured in the bucket, as and for the purpose specified.

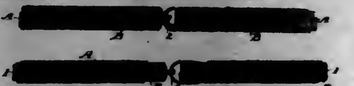
413,574. FURNITURE-CASTER. ALBERT STRONGMAN and RUDOLPH VIETOR, Grand Rapids, Mich. Filed Feb. 19, 1889. Serial No. 300,500. (No model.)

Claim.—1. In a furniture-caster, the combination of a vertical stem having an enlarged end at the top, a bushing in two parts having their edges adapted to rock upon each other, substantially as described, provided with a rib adapted for engaging the side of the socket inclosing the bushing, and a shoulder adapted for engaging said enlargement of the stem, substantially as and for the purposes described.

2. In a furniture-caster, in combination with a vertical stem having an enlarged top, a bushing in two parts D and D', the part D having the cap H and the notch arranged substantially as described, and the part D' having the leg E and having its edges inclined away upon either side of E, substantially as described, and the rib F, arranged between the leg E and cap H, substantially as and for the purposes described.

413,575. CHECK-PUNCH. FRIEND W. SMITH, Jr., and SAMUEL S. WILLIAMSON, Bridgeport, Conn. Filed Oct. 30, 1888. Serial No. 289,219. (No model.)

Claim.—1. The combination of the rotary spindle, the plate D rigid therewith, the tray E, pivoted beneath and to said plate, feed-rolls H H', journaled in said tray and plate, respectively, one above the other, springs adapted to keep said tray and plate together and render the downward movement of the tray resilient, ratchet-wheels rigid with the inner sides of the wheels H, pawl-carrier J, resting on the plate D and having terminal pawls 7 projecting into operative engagement with said wheels, lever K, pivoted to the plate D and having its extremities pivoted, respectively, to the carrier J and link L, the operating-lever pivoted within said spindle and having its heel end engaging with the link L, the dies secured upon the bed of the punch, the resiliently-acting punches mounted within the head, and the guide-plate provided with slots which identify the punches, substantially as set forth.

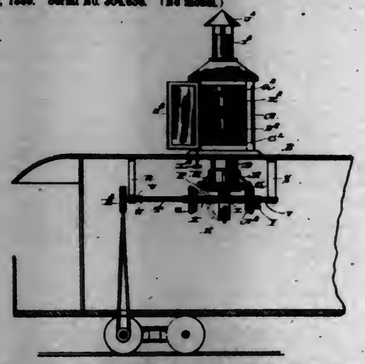


2. The combination of the feed-rolls journaled in pairs, one above the other, the ratchet-wheels rigid on the inner sides of the lower rolls, the carrier having terminal pawls engaging said ratchet-wheels, the reciprocatory link, the bell-crank lever pivoted at its ends to said carrier and link, respectively, and the operating-lever connected at its heel end to said link, substantially as and for the purposes set forth.

3. In combination, the spindle C, the plate D, rigidly secured thereto and having ears F, the tray E, pivoted to said plate between

said ears, the springs 2, normally maintaining the said tray in its upper position, the feed-rolls H H', journaled, respectively, in plate D and tray E, and the lever I, for depressing said tray, as set forth.

4. In combination, the plate D, having ears F, the tray E, normally maintained in its upper position and having pins 4, the lever I, having fins 5, the pivot-pin at 3, connecting said tray, plate, and lever, and the feed-rolls carried by said tray and plate, the fins 5 being arranged to engage pins 4, whereby the tray may be depressed against the action of its spring-support to separate the feed-rolls by downward pressure on said lever, as set forth.



413,576. MACHINE-BELTING. GARY B. SMITH, Kansas City, Mo. Filed Apr. 6, 1889. Serial No. 306,170. (No model.)

Claim.—1. As an improved article of manufacture, the herein-described metallic belting, consisting of an inner helical-coiled wire and an outer helical-coiled wire wrapped on the inner coil, substantially as described.

2. The belting herein described, consisting of a core of flexible material, a helical-coiled wire on the core, and an outer layer of coiled wire over the inner coil, substantially as described.

413,577. SIGNAL-LANTERN. GEORGE W. SMITH, Union City, Ind., assignor of one-half to James B. Hendricks, same place. Filed Mar. 28, 1889. Serial No. 304,636. (No model.)

Claim.—1. In a signal-lantern, the combination of the lantern-frame, a revolving cylindrical casing extending through the base of the same, a lamp arranged in the said cylindrical casing, and a shell attached to the upper end of the latter and having one or more spirals therein for the emission of light, substantially as set forth.

2. In a signal-lantern, the combination of the lantern-frame, the cylindrical casing extending through the base of the same and having a beveled gear-wheel attached to its lower end, a shaft arranged transversely below said casing, a sleeve mounted adjustably upon said shaft and having pinions adapted to alternately engage the beveled wheel upon the lower end of the revolving casing, mechanism for transmitting motion to the said shaft, the lamp mounted in the cylindrical casing, and a shell supported upon the latter and having spirals therein for the emission of light, substantially as set forth.

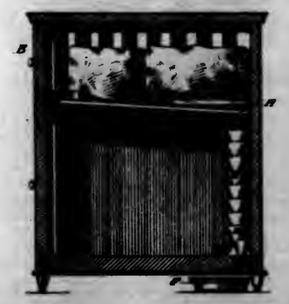
3. In a signal-lantern, the combination of a vertical revolving casing carrying a lamp, and a shell having spirals therein for the emission of light, hangers or brackets arranged adjacent to said revolving casing, a shaft mounted in the said hangers and composed of two parts or sections connected by a universal joint, a sleeve mounted adjustably upon the said shaft and provided with pinions facing in opposite directions and adapted to alternately engage the bevel gear-wheel upon the lower end of the vertically-revolving casing, and mechanism for operating the said shaft, substantially as set forth.

4. In a signal-lantern, the combination of a vertical revolving casing carrying a lamp, and a shell having spirals therein for the emission of light, a cap at the lower end of said casing having a central downwardly-extending spindle, and a hinged bracket having a step or bearing for the said spindle, substantially as and for the purpose set forth.

5. In a signal-lantern, the combination of a vertical revolving casing having a lamp, and a shell surrounding the latter and having spirals therein for the emission of light, a cap at the lower end of said casing having a downwardly-extending spindle, a hinged bracket having a step or bearing for said spindle, a transversely-arranged shaft composed of two parts or sections jointed universally and having an adjustable sleeve provided with pinions adapted to alternately engage a beveled gear-wheel upon the lower end of the revolving casing, and mechanism for operating or transmitting motion to the said shaft, substantially as and for the purpose set forth.

6. In a signal-lantern, the combination, with a revolving casing carrying a shell having spirals therein for the emission of light, and having at its lower end an interior annular flange, of a lamp the sides of which are provided with spring-catches having their lower ends extended inwardly through slots formed in a flange which extends downwardly from the bottom of said lamp and connected by means of a cord or chain, whereby the said spring-catches may be simultaneously operated to release the lamp from the casing, substantially as set forth.

7. The combination of the lantern-frame, the revolving casing having an interior annular flange at its lower end and provided with a shell having spirals therein for the emission of light attached to its upper end, a lamp provided with spring-catches to retain it in the said revolving shell, and a cord connecting the inner ends of said spring-catches, a cap at the lower end of the revolving casing having a downwardly-extending spindle, a hinged bracket having a step or bearing for the said spindle, and mechanism for operating the said revolving casing in either direction, substantially as and for the purpose set forth.



8. A signal-lantern having a revolving shell surrounding the light, and having spirals therein for the emission of light, in combination with reflecting-shutters hinged to diagonally-opposite corners of the lantern-frame, substantially as and for the purpose set forth.

9. The combination of the lantern-frame, the revolving casing carrying the lamp, and the shell having spirals therein for the emission of light, a cap attached to the upper end of said shell and having an upwardly-extending escape-tube, and a tube extending upwardly from the top of the lantern-case and affording a bearing for the said escape-tube, substantially as and for the purpose set forth.

10. The combination of the lantern-frame, the revolving casing extending through the base of the same and having at its lower end a cap provided with a spindle which is stepped or journaled in a hinged bracket, a lamp arranged within the revolving casing, a shell attached to the upper end of the latter and having spirals therein for the emission of light, a cap mounted upon the upper end of said shell and having an upwardly-extending escape-tube, a tube extending upwardly from the top of the lantern-frame and affording a bearing for the said escape-tube, and mechanism for operating the revolving casing and its attachments in either direction, substantially as and for the purpose set forth.

11. In a signal-lantern, the combination, with a lantern-frame, of a revolving casing extending downwardly through the base of the same, suitable mechanism for supporting and operating said revolving casing, a lamp arranged detachably within said revolving casing, a shell attached to the upper end of the latter and having spirals therein for the emission of light, and reflecting-shutters hinged at diagonally-opposite corners of the lantern-frame and provided with operating-rods extending downwardly through the base and provided with handles, by means of which they may be adjusted and manipulated, substantially as and for the purpose set forth.

413,578. REFRIGERATOR. ROBERT P. STEEL, Philadelphia, Pa. Filed Apr. 11, 1887. Serial No. 234,382. (No model.)

Claim.—1. In a refrigerator, an ice box or chamber in its upper portion, an inclined tray below said ice-chamber forming a drip-passage between the same and provided with an opening at its lowest end, and a refrigerator-chamber with a spiral drip-trough, having the upper end of the stem inserted in said opening in the tray and its lower end inserted in an opening in the refrigerator-chamber floor, said parts being combined substantially as and for the purpose set forth.

2. A refrigerator having an ice chamber or box, a tray, and a drip-trough of spiral form with a central stem with prolonged ends, the upper end being inserted in the tray and the lower end thereof in the floor, said trough being also provided with a foot which rests on the said floor, said parts being combined substantially as described.

413,579. BANJO-THIMBLE. SAMUEL S. STEWART, Philadelphia, Pa. Filed June 10, 1889. Serial No. 313,701. (No model.)

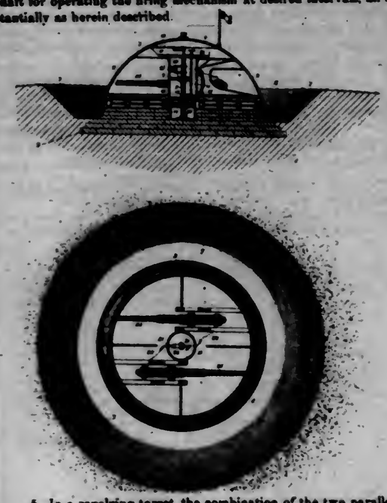
Claim.—1. A banjo-thimble having a removable striking-piece or finger, substantially as described.

2. A banjo-thimble consisting of a ring having a socket and a separate striking-piece, the latter being adapted to be fitted in said socket, and thus connected with the ring, substantially as described.

413,580. NUT-LOCK. FREDERICK J. TALBOT, Rasmoor Park, Sheffield, County of York, England. Filed July 23, 1888. Serial No. 280,764. (No model.) Patented in England Aug. 15, 1887, No. 11,131, and in Victoria July 23, 1888, No. 6,022.

Claim.—1. A lock-nut consisting of a nut having a saw-cut or slit through a portion of one side thereof, forming an angular tongue which is turned inward on an imaginary axis forming a triangle with said cut and the upper edge of said tongue, whereby the latter gradually encroaches upon the bore of the nut and will impinge the threads of the bolt in a downward as well as in an inward direction, substantially as shown and described.

2. A lock-nut consisting of a nut having a saw-cut or slit through a portion of one side thereof, said slit extending from the outer face or end of the nut diagonally across and into its bore and forming a triangular tongue, said tongue being forced inward encroaching upon the bore of the nut, whereby the threads on said tongue are adapted to impinge the threads of the bolt in a longitudinal as well as an inward or transverse direction to said bolt, and the encroachment of the threads of such tongue gradually increasing from the lower or inner end of the slit upward or outward toward the upper or outer face of the nut, and also from the lower toward the upper end of the said slit, substantially as and for the purposes set forth.

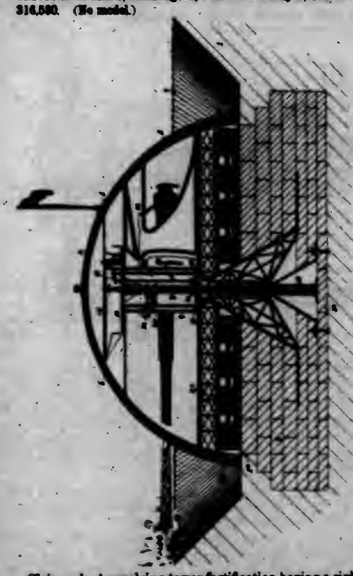


413,581. REVOLVING-TOWER FORTIFICATION. THEODORE R. TIRBY, Washington, D. C. Filed June 4, 1889. Serial No. 312,989. (No model.)

Claim.—1. A revolving-tower fortification provided with guns pointing in opposite directions and arranged side to side in parallel position on opposite sides of the central well or axis of the tower, causing said guns to mutually counterbalance each other and to be brought successively and alternately to a determined line of fire, all as herein explained.

2. In a revolving-tower fortification, the combination of guns mounted in parallel position side to side on opposite sides of the central well or axis of the tower and pointing in opposite directions, and the sighting-platform and its accessories, as shown and described, supported on a central theft and adjustable in position at the will of the operator.

3. In a revolving turret or other support, the combination of a central well-hole, the parallel oppositely-pointed guns mounted on either side thereof, electrical firing mechanism upon the guns, and suitable electrical supply and fixed contact-brush adapted to close the circuit with the firing mechanism, located on the fixed portion, whereby the guns are fired automatically and in succession.

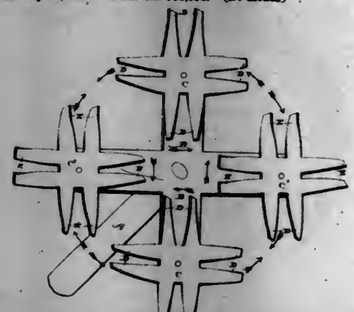


4. In a revolving tower, the combination of a central well-hole, oppositely-pointed guns mounted in parallel position side to side on each side of the well-hole, firing mechanism on the guns, a shaft fixed relatively to the rotation of the turret, and means carried by said shaft for operating the firing mechanism at desired intervals, all substantially as herein described.

5. In a revolving turret, the combination of the two parallel oppositely-pointed guns located side to side at equal distances from the center, suitable firing mechanism upon the guns, and a fixed mechanism adapted to fire the guns successively as each reaches a predetermined position, all substantially as herein set forth.

6. The combination, in a revolving turret, of a number of guns mounted side to side, pointed in opposite directions, and having suitable firing mechanism, a central shaft carrying means for operating the firing mechanism, and a sighting-platform, said shaft and platform being adjustable at will.

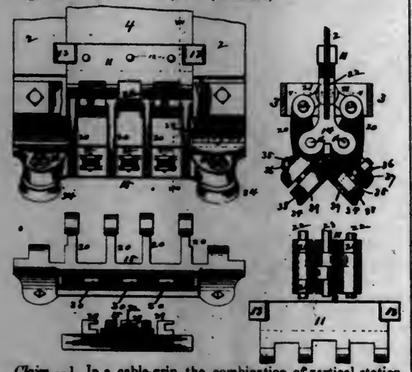
413,582. SIGHTING-PLATFORM FOR REVOLVING TURRETS. THEODORE R. TIRBY, Washington, D. C. Filed July 5, 1889. Serial No. 316,560. (No model.)



Claim.—1. A revolving-tower fortification having a sighting-platform mounted upon an independent foundation, with lateral supporting-

stays out of contact with the tower-well, so as to prevent the transmission of shocks from the revolving tower or fortification to the said sighting-platform, substantially as herein described.

2. The combination of the sighting-platform 11, vertical shaft 9, supporting said platform, supporting-socket 10, and a revolving-tower fortification surrounding the supporting-shaft 9 without direct contact therewith or with its lateral supporting-stays, as and for the purposes set forth.



3. In a revolving-tower fortification, the combination of the sighting-platform 11, rotating shaft 9, supporting said platform, a suitable bearing 10, affording lateral support to the rotating shaft 9 without direct contact with the revolving tower, and a shaft 14, pinion 15, and cogged rim 16 upon the fixed frame 17, for effecting the rotation of the shaft 9 and sighting-platform 11, as explained.

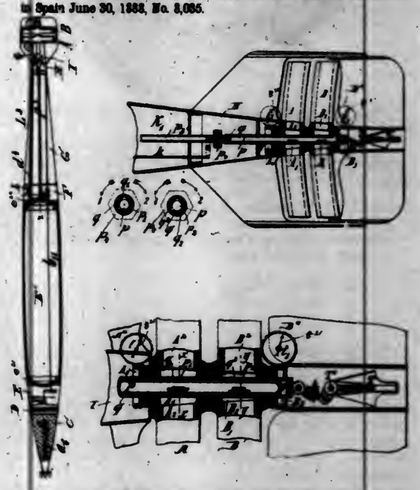
413,583. CHURN-DASHER. ANDREW D. VAN BIBBER, Zoin, W. Va. Filed May 13, 1889. Serial No. 310,562. (No model.)

Claim.—In a reciprocating dasher, the combination, with the operating-rod provided with four radial arms, of four propeller-wheels provided with twisted blades journaled thereon at their outer ends, the blades of each pair inclined in opposite directions and extending outward near to the periphery of its adjacent propeller and approximately to the junction of the arms, whereby the said wheels are revolved in opposite directions and cause opposing currents at their inner and outer peripheries, substantially as shown and described.

413,584. CABLE-GRIP. JACOB VOLK, St. Louis, Mo., assignor to the Volk Cable Crossing Grip and Car Brake Company, Chicago, Ill. Filed Aug. 3, 1889. Serial No. 319,630. (No model.)

Claim.—1. In a cable-grip, the combination of vertical stationary plates, cross-heads secured to the lower ends of the plates, jaws pivoted to the cross-heads, a connecting-link 24, pivoted to the jaws between the cross-heads, a movable plate, a lever for operating the movable plate, and toggles connecting the jaws to the movable plate, substantially as and for the purpose set forth.

2. In a cable-grip, the combination of movable jaws and mechanism for moving the jaws, said jaws having interlocking projections 27, substantially as and for the purpose set forth.



3. In a cable-grip, the combination of the jaws, mechanism for operating the jaws, and anti-friction rollers secured in pairs to the ends of the jaws, said rollers having stems with elongated journal-bearings to allow the rollers to adjust themselves to the position of the jaws, substantially as and for the purpose set forth.

4. In a cable-grip, the combination of the jaws, mechanism for operating the jaws, and the anti-friction rollers 34, having stems 35, with non-circular portions 37, threaded portions on one side of the non-circular portions, and journals on the other side of the non-circular portions, substantially as and for the purpose set forth.

5. In a cable-grip, the combination of the jaws, mechanism for operating the jaws, and anti-friction rollers 34, having elongated journals and inclined bearing-surfaces 39, substantially as and for the purpose set forth.

6. In a cable-grip, the combination of the jaws and dies 28, said dies having ears 29, with enlarged slots to receive retaining-pins smaller in diameter than the width of the slots to permit the jaws to be set out as the dies become worn, substantially as set forth.

413,585. AUTO-MOBILE TORPEDO. ADOLF G. VON B. DE PIROTSA, Vienna, Austria-Hungary. Filed Nov. 15, 1888. Serial No. 290,966. (No model.) Patented in Germany Feb. 24, 1888, No. 49,126; in France Feb. 24, 1888, No. 183,945; in Belgium Mar. 12, 1888, No. 81,003; in England Mar. 20, 1888, No. 4,297; in Italy Mar. 31, 1888, XXII, 23,195, XLV, 431; in Portugal May 17, 1888, No. 1,344; in Norway May 28, 1888, No. 304; in Austria-Hungary June 26, 1888, No. 8,008 and No. 21,102, and in Spain June 30, 1888, No. 8,085.

Claim.—1. In a torpedo, the combination of a non-rotary supply-pipe for conveying the motive power under pressure, having outlet-ports, with a screw-propeller provided with outlet-ducts through its blades and formed with a hollow hub which is journaled upon said supply-pipe at said ports and communicates with said ducts, substantially as described.

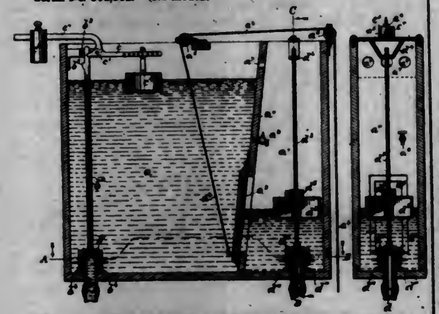
2. In a torpedo, the combination, with the compressed-air reservoir, the supply-pipe *p*, having two separate rows of side discharge-ports and conveying the motive fluid under pressure, and the tubular propeller-shaft *q*, having two corresponding rows of side discharge-ports, of two independent screw-propellers having their blades curved in opposite directions, and curved channels terminating in openings in the line of said curves and communicating with the said side ports in both the said pipes, substantially as described, for the purpose specified.

3. In a torpedo, the combination, with the compressed-air reservoir, the supply-pipe *p*, having two separate rows of side discharge-ports and conveying the motive fluid under pressure, and the tubular propeller-shaft *q*, having two corresponding rows of side discharge-ports, of two independent screw-propellers having their blades curved in opposite directions, and curved channels terminating in openings in the lines of said curves and having chambered hubs, into the chambers whereof the ports of both pipes open, and into which chambers the said curved channels open, whereby the said propeller-chambers serve as auxiliary reservoirs for the motive fluid which operates the propellers.

4. In a torpedo, the combination of a supply-pipe for conveying the motive fluid under pressure and provided with delivery-ports, a tubular shaft upon said pipe, having means for being moved longitudinally upon the same and having ports of greater longitudinal area than those of the supply-pipe and registering therewith, a screw-propeller journaled upon said shaft and having hollow blades communicating with said ports, and an immersing-rudder controlled by the longitudinal motion of said shaft, substantially as described.

5. The combination, with the screw-propellers A and B, the blades whereof are curved in reverse directions, said propellers having chambered hubs and an open passage formed in the blades thereof, of a tubular shaft connected with a source of motive fluid under pressure, on which shaft said propellers are loosely mounted, provided with delivery-ports registering with the propeller-hubs, and a tubular valve revolvable in the propeller-shaft and provided with ports adapted to register with the shaft-ports, whereby the area of the shaft-ports may be adjusted, substantially as and for the purposes specified.

6. The combination, with the screw-propellers A and B, the blades whereof are curved in reverse directions, said propellers having chambered hubs and an open passage formed in said blades, of a tubular shaft connected with a source of motive fluid under pressure, on which shaft said propellers are loosely mounted, provided with ports arranged in different longitudinal planes and registering with the propeller-hubs, and a tubular valve arranged within the propeller-shaft and having ports of greater area than the shaft-ports, arranged in the same longitudinal plane and adapted to register with the shaft-ports, whereby the relative area of the shaft-ports may be varied to vary the relative speed of the propellers, substantially as and for the purposes specified.



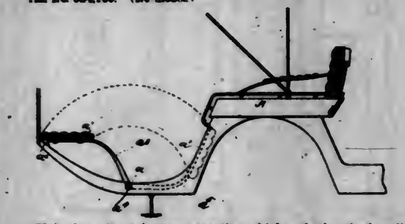
7. In a torpedo, the combination, with the propeller or propellers and the horizontal or immersing rudder, of a tubular propeller-shaft having an endwise motion in its bearings, said shaft being connected with and controlling the immersing-rudder, substantially as and for the purposes specified.

8. The combination, with the pipe *p*, closed at one end and connected at the other with a source of motive fluid under pressure, said pipe being revoluble and provided with ports p' p^2, arranged in the same longitudinal plane, of the tubular shaft *q*, mounted on pipe *p* and provided with ports q' q^2, arranged in different longitudinal planes, said ports being of less area than and adapted to register with the ports p' p^2, and reaction-propellers A B, loosely mounted on shaft *q*, substantially as and for the purposes specified.

9. The combination, with the pipe *p*, closed at one end and connected at the other with a source of motive fluid under pressure, said pipe being revoluble and provided with ports p' p^2, arranged in the same longitudinal plane, of the tubular shaft *q*, mounted and movable longitudinally on pipe *p*, said shaft being provided with ports q' q^2, arranged in different longitudinal planes and of less transverse area and of greater longitudinal area than the ports p' p^2 of pipe *p*, reaction-propellers A B, loosely mounted on shaft *q*, and a horizontal or immersion rudder controlled by said shaft, substantially as and for the purposes specified.

10. In a torpedo, the combination, with the compressed-air reservoir and the supply-pipe conveying the motive fluid under pressure, of two independent screw-propellers mounted loosely upon the same shaft, revolving in opposite directions and provided with worms upon their hubs, a registering device for each propeller having gearing engaged by said worms, and means, substantially such as described, for regulating the volume of air admitted to the propellers and the relative speed thereof, whereby the deviating or diverting action or effect of one propeller in relation to the other is ascertained and counteracted or compensated.

413,586. SUPPLY-TANK FOR WATER-CLOSETS OR OTHER RECEPTACLES. DARIUS WELLINGTON, Boston, Mass. Filed Feb. 27, 1889. Serial No. 301,302. (No model.)



Claim.—1. The combination of the tank *a*, having the water-inlet pipe *b* and water-outlet pipe *d*, the automatically-operated inlet-valve *b'* to the inlet-pipe, the automatically-operated valve *d'* to the outlet-pipe, the partition a'', dividing the tank into two chambers between the inlet and outlet pipes, a valve a^2, hinged to the partition, and a cord or chain a^4, connected with the partition-valve and disconnected from the outlet and inlet valves for operating said partition-valve independently of movement of the said outlet and inlet valves, substantially as described.

2. The combination, with the tank *a*, having the inlet and outlet pipes *b* *d*, and an automatically-operated outlet-valve for the outlet-pipe, of a cup-valve *b'* for the inlet-pipe, having a vertical rigid rod b'', the lever *c*, pivoted intermediate its ends in the tank and loosely attached by a joint to the upper end of and positively raising and lowering said rigid valve-rod, a float c^3 on one end of the lever and a weight c^3 on the other end of the lever, a partition a'', dividing the tank into compartments, and a valve a^2, hinged to said partition, and a cord a^4, for opening said valve against the pressure of the water, substantially as shown and described.

3. In a supply-tank for water-closets or other receptacles, the chamber *a*, having the inlet pipe *b* and valve *b'*, held against its seat by means of the weight c^3, float c^4, and lever c^2, the chamber a', having the discharge-pipe *d* and valve *d'*, operated by the float d^4, and collar d^3, adjustable on rod d^4, and the valve a^2, operated by the cord or chain a^4, all combined to operate substantially as set forth and described.

413,587. VEHICLE. HARLAN P. WELLS and JABEZ STOFFORD, Jr., Amesbury, Mass. Filed Nov. 24, 1888. Renewed Sept. 17, 1889. Serial No. 324,169. (No model.)

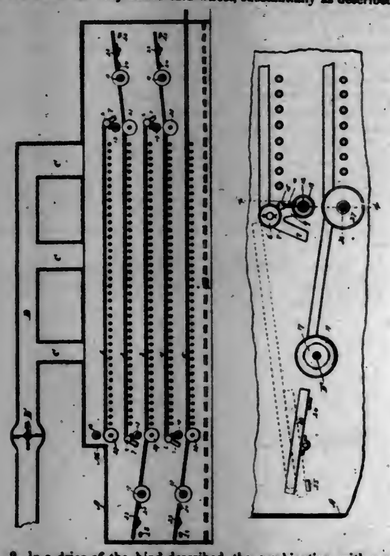
Claim.—1. As an improvement in vehicles, the herein-described portable seat, which consists of the seat *a'*, with the arms a^3, provided with the slots *a*, constructed and adapted substantially as described, for the purposes set forth.

2. In vehicles of the class herein named, the portable seat *a'*, having the slotted arms a^3, in combination with the raised rib a^2 and bolts a^4, constructed and arranged in the manner herein described, for the purposes set forth.

413,588. HORSE-DETACHER. GEORGE W. WIGGINS, Edison, Ga. Filed June 14, 1889. Serial No. 314,316. (No model.)

Claim.—1. In an animal-releasing device, the combination, with the whiffletree, of the box secured to the end of the same, the hook pivoted in said box and engaged by the trace, and the removable pin inserted through the box and the hook, as set forth.

2. In an animal-releasing device, the combination, with the whiffletree, of the box provided with a lateral screw adapted to enter the end of the whiffletree, the hook pivoted in the box, engaged by the trace, and having an L-shaped portion O, and the removable pin inserted transversely through the box and the hook, as set forth.



3. The releasing device consisting of the ring A, secured to the harness and supporting the shaft, the hook H on the shaft, engaged by a ring on the holdback, the pivoted hook at the end of the whiffletree, engaging the trace, and the removable pin securing said hook, as set forth.

4. In an animal-releasing device, the ring or yoke A, having the buckle-frame B on one side and the concave supporting-plate C in its bottom, as set forth.

413,589. FRUIT-DRIER. ELI WHITE, Mount Morris, assignor to the Excelsior Steam Evaporator Company, Perry, N. Y. Filed Oct. 16, 1888. Serial No. 288,260. (No model.)

Claim.—1. In a drier in which the material is placed on trays,

the combination, with a series of suitable ways arranged in different planes, of a positively-rotated wheel located between said ways beyond the end of the upper one and a support beyond the wheel for sustaining the end of the tray above said wheel, substantially as described.

2. In a drier of the kind described, the combination, with a series of ways arranged in different planes, of a rotating wheel located between said ways beyond the end of the upper one and a tilting support beyond the wheel for sustaining the end of the tray above said wheel, substantially as described.

3. In a drier of the kind described, the combination, with a series of ways arranged in different planes, of a rotating wheel located between said ways beyond the end of the upper one, a support beyond the wheel, and mechanism, substantially as described, for moving the trays in succeeding planes in opposite directions, as set forth.

4. In a drier of the kind described, the combination, with the series of ways arranged in different planes having inclines at opposite ends alternately, of a rotating wheel located near each of said inclines between the ways and beyond the ends of the upper one and a support for the end of the tray beyond said wheel, substantially as described.

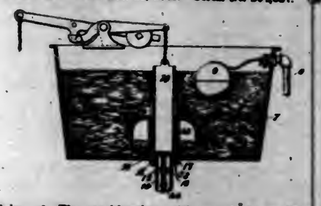
5. In a drier, the combination, with a series of ways arranged in different planes, of a series of trays adapted to travel thereon, a pair of rollers at alternately opposite ends of each way, between which the trays are grasped and moved, one at least of said rollers being driven, and supports beyond the ends of the ways for permitting the transfer of the trays from one way to another, substantially as described.

6. In a drier, the combination, with a series of ways arranged in different planes, of a rotating shaft having spring-pressed gripping-disks thereon arranged beyond and below one end of each of the ways, said disks arranged to engage on one side their centers with the trays, so as to drive them, substantially as described.

7. In a drier, the combination, with a series of ways arranged in different planes, of a rotating shaft having spring-pressed gripping-disks thereon arranged beyond and below one end of each of the ways and supports for the tray ends beyond said shaft, substantially as described.

8. In a drier, the combination, with a series of ways arranged in different planes, of a rotating shaft having a supporting surface or wheel and spring-pressed gripping-disks thereon beyond and below one end of each of the ways, substantially as described.

9. In a drier, and as a means for moving the trays, the shaft having a supporting wheel or surface and spring-pressed gripping-disks connected so as to rotate with said shaft and arranged to support and move the trays, substantially as described.



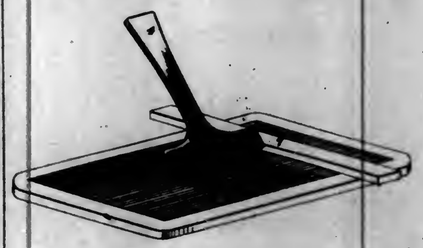
10. In a drier, the combination, with two ways, the castings at the end having the inclines 7 thereon, the driving-roller for the next succeeding way arranged beneath, and the spring-pressed co-operating roller supported from said casting, substantially as described.

11. The combination, with the shaft having the supporting-wheel thereon provided with laterally-projecting teeth, of a disk having recesses for the teeth movable longitudinally on the shaft and a spring for moving said disk toward the wheel, substantially as described.

12. The combination, with the shaft having the supporting wheel or surface thereon, of disks located on opposite sides said supporting-surface movable on the shaft, interlocking projections and recesses for causing the simultaneous movement of the disks and wheel, and springs for pressing the disks toward the supporting-surface, substantially as described.

13. The combination, with the shaft having the supporting wheel or surface thereon, of the disks located on opposite sides the supporting-surface and movable longitudinally on the shaft, interlocking projections and recesses for causing the simultaneous movement of the disks and wheel, collars secured to the shaft, and springs between the collars and disks, substantially as described.

413,590. TANK FOR SANITARY BASINS. PATRICK J. WHITE, St. Louis, Mo. Filed Dec. 19, 1888. Serial No. 294,027. (No model.)

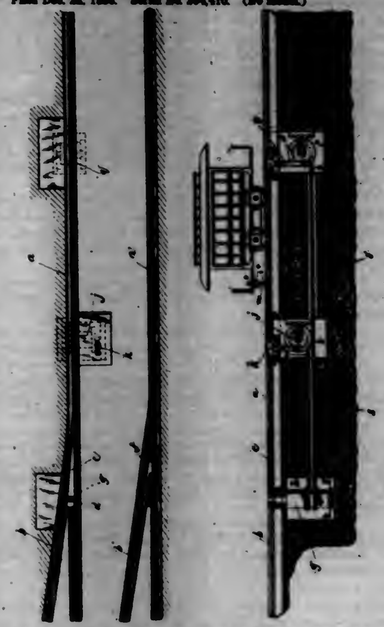


Claim.—1. The combination, with a tank for sanitary basins, of a float governing the discharge thereof, an overflow-tube 10, to which said float is secured, a split ring 20, soldered to the float, and an open ring 21, for securing said float to said overflow-pipe at any point along the same.

2. The combination, with a tank for sanitary basins, of an overflow-tube 10, a valve at the lower end of said tube controlling the discharge from said tank, and an adjustable inverted cup 19, secured to said overflow-tube above said valve.

3. The combination, with a tank for sanitary basins of the character described, of the overflow-tube 10, the valve carried at the lower end thereof, the inverted cup 19, secured to said tube above said valve, the cylinder 23 in said cup making an air-tight joint with the same, the split ring 20, secured to the upper part of said cup, an open ring 21, embracing said split ring 20, a set-screw 22, for drawing the ends of said open ring 21 together and securing the float to said tube 10 at any point along the same, and a guide-rod 13 for said valve, substantially as set forth.

4. The combination, with a tank for sanitary basins, of an overflow-tube, a valve at the lower end of said tube controlling the discharge from said tank, an inverted cup 19, completely submerged in the water in said tank, governing said valve and fixed to said overflow-tube near the lower end thereof above the valve, thereby permitting the discharge to take place from the tank only when the float and valve are raised by extraneous force, a cylinder 23 in said cup embracing the overflow-tube and making an air-tight joint with said overflow-tube and cup, for the purpose described.



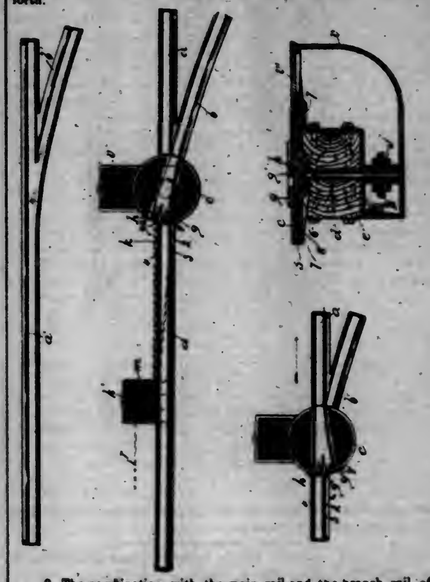
413,591. RULING DEVICE FOR SLATES, &c. ALBERT G. W. WILL, St. Louis, Mo. Filed May 4, 1889. Serial No. 309,582. (No model.)

Claim.—1. A hand ruling device for slates, consisting of a handle carrying one or more series of elastic cutting-points arranged at suitable distances apart for abrading the surface of the slate.

2. A hand ruling device for slates, consisting of a handle 4, an elastic metallic plate 5 carried thereby, and one or more series of curved teeth or cutting-points 6, cut or stamped therein and arranged at suitable distances apart, for abrading the surface of the slate.

413,592. STREET-RAILWAY SWITCH. JOHN H. WILLIAMS, Boston, assignor of two-thirds to Benjamin F. Barnard, Wakefield, Mass. Filed Dec. 22, 1888. Serial No. 294,410. (No model.)

Claim.—1. The combination, with a track and a movable switch, of a drum or shaft connected with said switch, a switch-opening drum having an operating-rod arranged between the main-track rails for operation by an attachment on a car, a switch-closing drum located farther from the switch than the said opening-drum and having an operating-rod arranged to be acted on by a car-wheel on the main track, and flexible connections between said switch opening and closing drums and the switch drum or shaft, as set forth.



2. The combination, with a track and a movable switch, of a series of vaults *h i p* below the track, pipes or conduits connecting said vaults, a vertical drum *g*, journaled in the vault *h* and secured to the switch, horizontal drums *j o*, journaled, respectively, in the vaults *i p*, an operating device for the drum *j*, arranged between the tracks, an operating device for the drum *o*, arranged with its upper end in one of the track-rails, and cables or chains *n r*, connecting the drum *g* with the drums *j o*, respectively, all arranged and operating substantially as set forth.

3. The combination, with the switch rail and track, of a drum *g*, located below and attached to the switch-rail, drums *j o*, located at different distances from the switch and provided, respectively, with operating-rods *k q*, which are arranged to project alternately above the track, one being arranged to be operated by an attachment on the car and the other by a car-wheel, and cables *n r*, connecting the drum *g* with the drums *j o*, respectively, said cables being tightly drawn between said drums, whereby when one operating-rod is depressed the other is raised, and vice versa.

4. The combination, with the switch rail and track, of a drum *g*, located below and attached to the switch-rail, drums *j o*, located at different distances from the switch and provided, respectively, with operating-rods *k q*, which are arranged to project alternately above the track, one being arranged to be operated by an attachment on the car and the other by a car-wheel, and cables *n r*, connecting the drum *g* with the drums *j o*, respectively, and vaults *h i p* and pipes *s s'*, constituting a water-excluding casing for said drums and cables, as set forth.

413,593. STREET-RAILWAY SWITCH. JOHN H. WILLIAMS, Boston, assignor of two-thirds to Benjamin F. Barnard, Wakefield, Mass. Filed Feb. 11, 1889. Serial No. 299,269. (No model.)

Claim.—1. The combination, substantially as set forth, with the fixed track-rails *a b*, of a fixed supporting-plate located at the point of divergence of the rail *b* from the main rail *a*, the vertical shaft *d*, passing through said plate and engaged below the latter with a flexible cord or chain, whereby said shaft may be rotated by power communicated from a distant point, and a circular table attached to the upper end of said shaft and arranged concentrically thereon, said table having suitable track-sections co-operating with the rails *a b*, as set forth.

2. The combination, with the main rail and the branch rail, of the circular table or rotary switch having the curved tread-section *g* and the pointed section *g'*, relatively arranged substantially as shown.

3. The combination, with the main rail and the branch rail, of the circular table or rotary switch having the curved tread-section *g* and the pointed section *g'* and the guard-section *h*, relatively arranged substantially as shown.

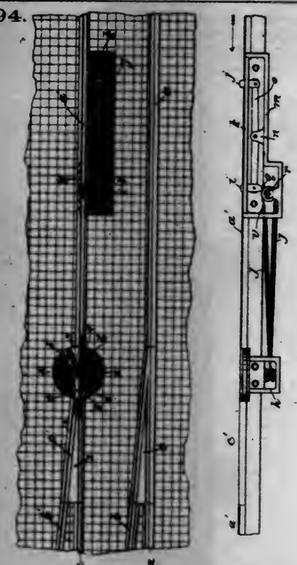
4. The combination, with the main rail and the branch rail, of the centrally-pivoted table or rotary switch having stops *s s'*, as set forth.

413,594. RAILWAY-SWITCH. JOHN H. WILLIAMS, Boston, assignor of two-thirds to B. F. Barnard, Wakefield, Mass. Filed July 13, 1888. Serial No. 317,455. (No model.)

Claim.—1. A circular switch-table provided with two sets or series of tread-sections, one section of each set or series being adapted to operate alternately as a tread-section and as a guard-flange section, as set forth.

2. A circular switch-table having two tread-sections arranged at an obtuse angle with each other and two tapered or wedge-shaped sections, each adapted to act alternately as a tread and as a guard-flange section, as set forth.

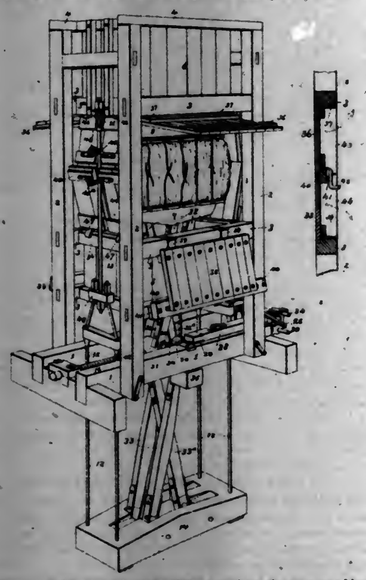
3. The combination of a main rail *a'*, a branch rail *b'*, a frog *c'*, having the tread-section 2 and the combined tread and guard section 3, and a circular switch-table having the tread-sections 4 5 and the combined tread and guard sections 6 7, as set forth.



4. The rotary switch-table having the tread-sections and the combined tread and guard sections, the vertical shaft attached to said table, and means for rocking or reversely rotating said shaft and table, all combined substantially as set forth.

5. The switch-table having the tread-sections and the combined tread and guard sections, the shaft *f*, attached to said table, a shaft *s*, located at a distant point, an endless cable connecting said shafts, a pivoted lever *o*, connected at one end with a disk on the shaft *s*, and means, substantially as described, for oscillating said lever *o*, all combined substantially as set forth.

6. The rotary balanced switch-table, combined with the shaft at-



413,594.

tached to said table and electrically-operated mechanism to partially rotate said shaft back and forth.

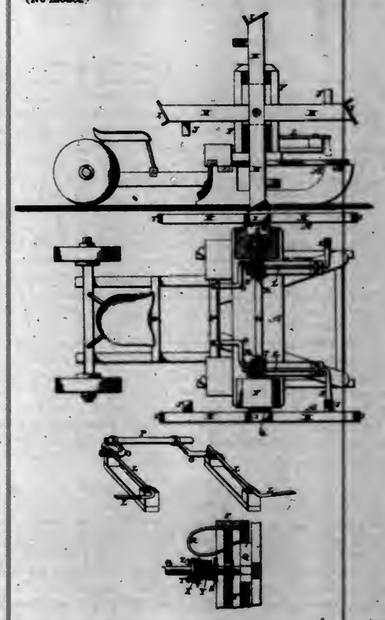
413,595. BALING-PRESS. CARLOS G. WILSON, Milledgeville, Ga. Filed May 9, 1888. Serial No. 273,275. (No model.)

Claim.—1. The combination of the press-box, the upper and lower followers, a beam carrying the upper follower, the cross-head beneath the press-box, rods connecting said beam with said cross-head, a right-and-left screw, the nuts 30 and 31, the upper paired links 32 and single link 32^a, crossed at their upper ends, and the lower paired links 33 and single link 33^a, crossed at their lower ends, substantially as described.

2. The combination of the press-box consisting of upper portion 6, having vertical slots in the ends thereof, the lower portion 5, and a central portion having upper and lower side doors, the upper follower 8, having a supporting-beam 9, formed with contracted necks working in the vertical slots, the lower follower 7, the cross-head 14 beneath the press-box, toggle mechanism between the lower follower and the cross-head, and the rods connecting the said beam with the said cross-head, the beam being hinged to one rod, so as to move in a horizontal plane, substantially as described.

3. The press-box having a central part provided with rabbeted side and end frames, the side doors 36 and 38, having double hinges 37 and 39, respectively, and fitting in the side frames, the end doors 43 and 44, having double hinges 46 and 47, respectively, and fitting in the end frames, and suitable fastenings for the doors, substantially as described.

4. The combination of the press-box, followers working therein, the doors 38 and 44, connected to the frame by double hinges 39 and 47, adapting said doors to engage with the frame of the press when closed and to drop into vertical position out of the way when open, and suitable fastenings for the doors, as herein explained.

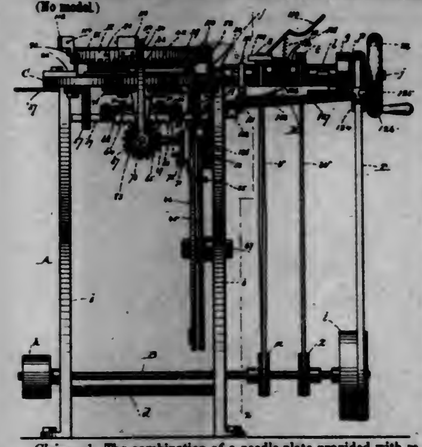


5. The end doors 43 44, made in separate parts connected by yokes 45 45^a, permitting said doors to pass the tie-rods in opening, as explained.

6. The combination of the side doors 36 38 and end doors 43 44 with the clamp-bars 42 to fasten said doors together, as explained.

7. The combination of the side doors 36 38, fitting one over the other, the inclined keepers 41 on the outer doors, and the clamp-bars 42, bent at right angles and engaging with the inclined keepers to force and retain the doors in their closed position, as explained.

8. The combination of the side doors 36 38, shutting one over the other, the end doors 43 44, shutting one over the other, the battens 40 and 49 on the side and end doors, respectively, and the clamp-bars 42, bearing laterally against the end-door battens and engaging over keepers on the side-door battens, substantially as and for the purposes set forth.



413,596. CORN-PLANTER. WILLIAM WOODLING and REASON L. WOODLING, Logansport, Ind. Filed Aug. 10, 1889. Serial No. 320,392. (No model.)

Claim.—1. The combination of the frame A, the guides F, mounted thereon, the boxes Q and rollers placed inside of the guides, the shaft G, which passes through the boxes and rollers, the springs for retaining the boxes to position, and the arms for causing the shaft to revolve, substantially as described.

2. The combination of the guides, the boxes and rollers placed inside of the guides, the shaft G, provided with the flanges S, the set-screws T, springs Y, and the washers V, substantially as set forth.

413,597. CIRCULAR-KNITTING MACHINE. JOSEPH A. BURLESON, Lake Village, N. H., assignor, by mesne assignments, to himself and George D. Barton, Boston, Mass. Filed Jan. 10, 1889. Serial No. 296,912. (No model.)

Claim.—1. The combination of a needle-plate provided with radial needle-slots and with an arc-shaped slot in its body, the needles, a curved bar, as 32, disposed in said arc-shaped slot and provided with a slot through which the heels of a portion of the needles pass, and means for raising and lowering said curved bar.

2. The combination of a needle-plate provided with radial needle-slots and with an arc-shaped slot in its body, the needles, a curved bar, as 32, disposed in said arc-shaped slot and provided with a slot through which the heels of a portion of the needles pass and with dependent rods, as 33, and a horizontally-adjustable frame, as 35, disposed below said curved bar and provided with cam-surfaces, as 34, for engaging said rods.

3. The combination of a needle-plate provided with radial needle-slots and with an arc-shaped slot in its body, the needles, a curved bar, as 32, disposed in said arc-shaped slot and provided with a slot through which the heels of a portion of the needles pass and with dependent rods, as 33, a horizontally-adjustable frame, as 35, disposed below said curved bar and provided with cam-surfaces, as 34, for engaging said rods, and springs for depressing said bar when released from said cam-surfaces.

4. The combination of the needle-plate, the needles, two curved rack-bars 42, disposed around the needle-plate and provided with horizontal slots 43, a horizontal sliding rack-bar 59, disposed below each of said curved rack-bars, two spring-pawls pivoted to each of the rack-bars 59, pinions 67 in engagement with rack-bars 59, means for oscillating said pinions, and means for disengaging said pawls from said curved rack-bars.

5. The combination of the needle-bed, the needles, the cam-plate, a main shaft provided with two fixed pulleys, an auxiliary shaft provided with means for driving the cam-plate, two loose pulleys on said auxiliary shaft, crossed and straight belts connecting the fixed and loose pulleys, a longitudinally-movable sleeve splined to the auxiliary shaft between said loose pulleys, spring-cushioned pins in said sleeve for entering holes in said loose pulleys, a pivoted bell-crank lever, one arm of which engages a flanged groove in said sleeve, a curved lever hinged to the opposite end of said bell-crank lever, and bunters on said cam-plate for engaging said curved lever.

6. The combination of the needle-bed, the needles, the cam-plate, a main shaft provided with two fixed pulleys, an auxiliary shaft provided with means for driving the cam-plate, two loose pulleys on said auxiliary shaft, crossed and straight belts connecting the fixed and loose pulleys, a longitudinally-movable sleeve splined to the auxiliary shaft between said loose pulleys, spring-cushioned pins in said sleeve for entering holes in said loose pulleys, a pivoted bell-crank lever, one arm of which engages a flanged groove in said sleeve, a curved lever hinged to the opposite end of said bell-crank lever, bunters on said cam-plate for engaging said curved lever, a horizontal lever pivoted to the frame of the machine at right angles to said curved lever and provided with a slot engaged thereby, and means for raising and lowering said horizontal lever.

7. The combination of a cam-plate provided with radial chambers 94, a sliding ring, as 85, disposed on said cam-plate and provided with diagonal slots 96, a pivoted bar, as 122, for actuating said ring, a lever or stop, as 110, against which said pivoted bar abuts to move the ring in the rotation of the cam-plate, and horizontal pins disposed in the chambers of the cam-plate and provided with vertical studs engaging the slots of the sliding ring.

8. The combination of the needle-plate, the needles, curved rack-bars outside the needle-plate provided with slots for raising the heels of a number of the needles, straight rack-bars bearing actuating-pawls for moving said curved bars, vertical levers, pinions on the journals of said levers for actuating said straight rack-bars, and a cam-plate provided with pins for tripping said levers and alternately moving said curved rack-bars.

9. The combination of a curved bar, as 32, provided with a needle-slot, a horizontally-movable frame provided with projections having inclined sides, rods secured to said bar and resting on said stud, and springs for forcing said rods downward when the frame is revolved.

10. The combination of a ratchet-wheel, as 46, provided on one face with cam-plates and tracks, operative devices therefor, a pivoted bar provided with a stud working in said tracks, curved rack-bars having needle-slots, straight rack-bars provided with actuating-pawls engaging said curved bars, pinions for operating said straight rack-bars, means for actuating said pinions, bars connected to said pivoted bar, and provided with laterally-projecting arms having studs for engaging said pawls to release them from said curved rack-bars.

11. The combination of a belt-shipper for shipping the main driving-belt, a ratchet-wheel, a pallet for driving said ratchet-wheel, mechanism for operating said pallet, a cam-plate provided with a cam for actuating said mechanism, a bar pivoted to said belt-shipper and projecting over said ratchet-wheel, said bar being provided with a notch, a hook for engaging said notch, a stud on said ratchet-wheel for engaging said bar at a determined point in the revolution of said wheel to release said bar from said hook, and a spring for sliding said bar when released to operate the belt-shipper.

12. The combination of the needle-plate, the needles, curved rack-bars 42, provided with slots 43, for receiving the heels of a number of the needles, straight rack-bars 59, spring-actuated pawls 61 and 62, supported on said straight rack-bars and adapted to engage said curved rack-bars, shaft 73, provided with pinions 67, engaging said straight rack-bars, vertical levers 83, rigidly connected with said pinions, a rotary cam-plate provided with radial chambers 94, a sliding ring 85, disposed on said cam-plate and provided with diagonal slots 96, a pivoted bar 122, for actuating said rings, a lever or stop 110, against which said pivoted bar abuts to move the ring in the rotation of the cam-plate, and horizontal pins disposed in the chambers of the cam-plate and adapted to engage said vertical levers, said pinions being provided with vertical studs engaging the diagonal slots of the sliding ring.

13. The combination of the ratchet-wheel 46, having the concentric tracks 76 77 78 and the cam-plates 74, 79, 80, 81, and 82, disposed at intervals in said tracks, a pivoted bar provided with a stud traveling in said tracks, and a widening and narrowing mechanism controlled by said pivoted bar.

14. The combination of the needle-plate, the needles, the curved rack-bars 42, provided with slots 43, the straight rack-bars 59, provided with pawls 61 and 62, the springs 64, the pinions 67, for operating said straight rack-bars, means for actuating said pinions, the pivoted bar 66, having the stud 72, the bars 68, provided with arms 69, having pin 70, for engaging said pawls, the ratchet-wheel 46, having tracks in which said stud travels, and cam-plates disposed at intervals in said tracks, a pallet for moving said ratchet-wheel, and means for actuating said pallet.

15. The combination of the needle-bed, the needles, the cam-plate a shaft provided with means for driving the cam-plate, two loose pulleys on said shaft, means for driving said pulleys in opposite directions, a longitudinally-movable sleeve splined to said shaft between said pulleys, a pivoted bell-crank lever, one arm of which engages a flanged groove in said sleeve, a curved lever hinged to the opposite end of said bell-crank lever and projecting over the cam-plate when depressed, and bunters on the cam-plate for engaging said hinged lever and moving the sleeve to secure said pulleys, whereby a reciprocating motion may be imparted to the cam-plate.

16. The combination of the needle-plate, the needles, a horizontal rotary cam-plate provided with a cam-track for actuating the needles, a slotted curved bar in said needle-plate, means for depressing said bar and throwing a determinate number of needles out of action, two sliding curved rack-bars disposed around said needle-plate and provided with needle-slots, straight rack-bars having pawls for actuating said curved bars, pivoted levers having pinions on the pivots thereof for actuating said straight bars, a sliding ring on said cam-plate, a pivoted lever for actuating said ring, a stop for engaging said pivoted lever, pins in said cam-plate provided with vertical studs working in slots in said ring, whereby the pins are projected when the rings move, and adjunctive mechanism for imparting a reciprocating motion to said cam-plate.

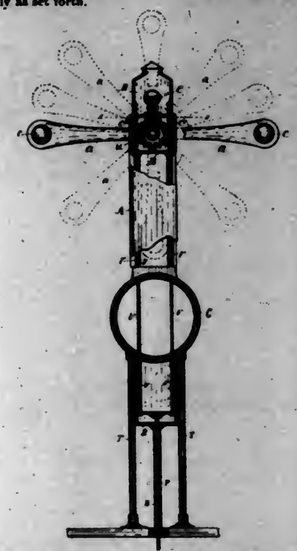
413,598. BREECH-LOADING ORDNANCE. GEORGE CROVER, Southington, Conn. Filed June 6, 1889. Serial No. 313,202. (No model.)

Claim.—The combination of a cannon, a breech-pin inserted in the breech thereof and provided with a recess in its under side, a weighted cam-lever pivoted in a slot in the breech of the cannon and adapted to automatically engage the said recess in the breech-pin and prevent the withdrawal of the latter, substantially as and for the purposes set forth.

413,599. RUBBER ERASER. GEORGE DEAN, Grand Rapids, Mich. Filed July 29, 1889. Serial No. 319,005. (No model.)

Claim.—1. An eraser consisting of a core or stiffener and a band or tube of rubber or other erasive material having flexible ends projecting beyond the core or stiffener substantially parallel therewith and providing inner and outer yielding edges, substantially as described.

2. An eraser consisting of a band or tube of rubber or other erasive material having flexible ends, and a core or stiffener movable therein, the said ends projecting beyond the core or stiffener substantially parallel therewith and providing inner and outer yielding edges, substantially as described.



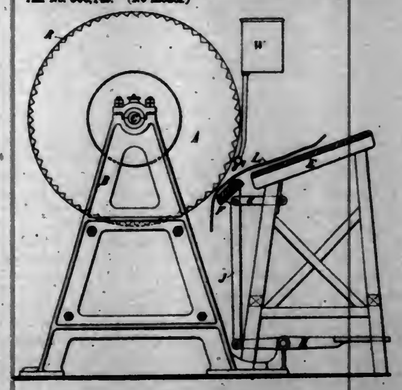
3. An eraser consisting of a core or stiffener and an endless band or tube of rubber or other erasive material held in place by contraction on the core or stiffener, having flexible ends projecting beyond the core or stiffener, substantially parallel therewith and providing inner and outer yielding edges, substantially as described.

4. An eraser having recesses in its ends, providing inner and outer yielding edges, substantially as described.

413,600. RAILWAY-STATION SIGNAL. BUKNER F. FREELAND, Vinton, Ind. Filed Dec. 28, 1888. Serial No. 294,544. (No model.)

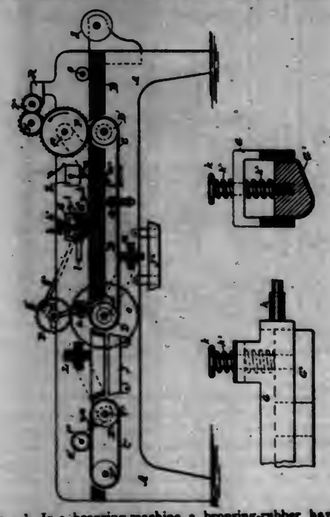
Claim.—1. The combination of a suitable support having a wing on each of the two opposite sides, and two signal-arms, each having an independent axle, said axles having bearing in said support on a like plane, and the arms, axles, and wings being so arranged that both arms will be visible at the same time or invisible at the same time, substantially as set forth.

2. The combination of a suitable support, independent shafts having bearings in said support, the outer end of each shaft having attached thereto a gear-wheel and a signal-arm, and a vertically-playing rod provided with racks to mesh with the gears, one on one side of one gear and the other on the other side of the other gear, substantially as set forth.



3. The combination of a support having hollow upright standards, a chamber supported by said standards, two independent shafts having bearings in said chamber, the gear and arm on the outer end of each shaft, a vertically-playing rod having the branches passed up through the two, diagonally opposite of said standards, and the racks terminating the end of said branches and meshing on a side of each gear opposite to each other, substantially as set forth.

4. The combination of the support or tower, consisting of the lower corner standards, the hollow rod opening beneath the base-support or ground, the chamber above said rod and into which chamber it enters, the dial-case, the hollow standards above said case, a chamber supported by said latter-named rods, the signal-arm shafts having the gears in said chamber, the vertically-playing rod within the lower hollow rod, the branch rods extending from the lower chamber up through the dial-case and the upper hollow rods, said branches terminating within the upper chamber in the rack-gears, substantially as set forth.



5. The combination of a support, a light-house supported thereby, the two signal-arms having each an independent axis and adapted to swing toward and from each other, as stated, and a light at the free end of each arm, substantially as set forth.

413,601. APPARATUS FOR TREATING HIDES. HERMANN R. FREUDENBERG, Weinheim, Baden, Germany. Filed Feb. 16, 1889. Serial No. 300,149. (No model.)

Claim.—The herein-described machine for flesking and softening untanned skins, and comprising a rotary grinding-stone with grooves on its periphery diverging from the center toward the edges thereof, a supporting-surface for the skins, and a water-supply pipe to direct a current of water onto the skins under treatment, all substantially as described.

413,602. BROWSING-MACHINE. WILLIAM P. H. GILDEMEISTER, Cleveland, Ohio. Filed June 8, 1889. Serial No. 313,652. (No model.)

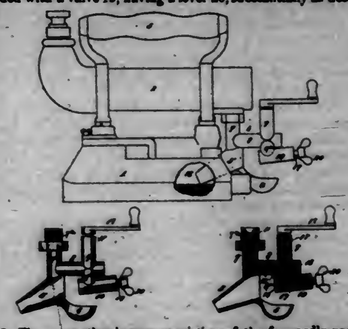
Claim.—1. In a browsing-machine, a browsing-rubber having a combined reciprocating and oscillating motion, substantially as and for the purposes set forth.

2. In a browsing-machine, the rubber having a reciprocating movement and lifting at each stroke, substantially as described.

3. In a browsing-machine, the combination of a rubber having a combined reciprocating and oscillating movement, an endless apron for feeding the work, and a sifting-box for applying the bronze-powder, substantially as described.

4. The combination, in a bronzing-machine, of a traveling apron for carrying the work, a sifting-box for applying the bronze-powder, a browsing-rubber having a combined reciprocating and oscillating movement, whereby it is caused to lift from the work at each stroke, and a brush for cleaning off the loose powder from the work, substantially as described.

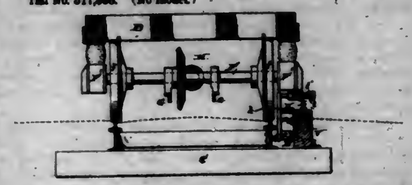
5. In a bronzing-machine, the combination of an endless apron for feeding the work, a sifting-box for applying the bronze-powder, a browsing-rubber having a reciprocating movement and lifting from the work at each stroke, a brush for cleaning the work, and a brush for cleaning said apron, substantially as described.



6. In a bronzing-machine, the combination of the endless apron, feed-rollers, and guide-fingers for feeding the work and retaining it in position, a sifting-box for applying bronze-powder, a reciprocating rubber for bronzing the work, a brush for cleaning the work, and a secondary apron and feed-rollers for forcing the work to feed past the cleaning-brush and discharging the finished work, substantially as described.

7. The bronzing-rubber made in sections with diagonal overlapping ends, each section removably secured to the carrier to permit the removal of one or more sections, substantially as described.

413,603. SELF-GENERATING BURNER FOR SAD-IRONS. GUSTAVUS HEINDL, St. Louis, Mo., assignor to the National Self-Heating Sad-Iron Company, same place. Filed Oct. 3, 1888. Serial No. 287,060. (No model.)



Claim.—1. The generating-burner consisting of the forwardly-projecting commingling-tube 5, the supply-arm 7, extending upwardly therefrom, having a passage 11, the conducting-body 8, extending outwardly from the juncture of the tube and arm in a horizontal direction, having a passage 12, the main valve-arm 9, extending upwardly from the body, the short neck 9ª, extending downwardly from the body, having a passage 13, and the jet-valve head 10, depending from the neck, having a jet-orifice 14, substantially as described.

2. The generating-burner consisting of the forwardly-projecting commingling-tube 5, the supply-arm 7, extending upwardly therefrom, having a passage 11, the conducting-body 8, extending outwardly from the juncture of the tube and arm in a horizontal direction, having a passage 12, the main valve-arm 9, extending upwardly from the body, having a screw-valve 17, provided with a lever 18, the short neck 9ª, extending downwardly from the body, having a passage 13, and the jet-valve head 10, depending from the neck, having a jet-orifice 14, and provided with a valve 19, having a lever 20, substantially as described.

3. The generating-burner consisting of the forwardly-projecting commingling-tube 5, having a drip-cup 6, extending outwardly therefrom, the supply-arm 7, extending upwardly from the tube, having a passage 11, the conducting-body 8, extending outwardly from the juncture of the tube and arm in a horizontal direction, having a passage 12, the main valve-arm 9, extending upwardly from the body, having a screw-valve 17, provided with a lever 18, the short neck 9ª, extending downwardly from the body, having a passage 13, and the jet-valve head 10, depending from the neck, having a jet-orifice 14, and provided with a valve 19, having a lever 20, substantially as described.

413,604. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa., assignor, by mesne assignments, to the Thomson-Houston Electric Company, Boston, Mass. Original application filed Jan. 14, 1889. Serial No. 296,262. Divided and this application filed July 13, 1889. Serial No. 317,208. (No model.)

Claim.—1. In an electric railway, the combination of a traveling vehicle, a stationary source of electric supply, a bared working-conductor extending along the path of the vehicle, and a current-collector device of less width than the diameter of the wheel and supported immediately outside of the wheel of the vehicle and upon the axle-box.

2. In an electric railway, the combination of a stationary source of electric supply, bared working-conductors extending along the path of the vehicle, an electrically-propelled vehicle, and depending collectors to receive electricity from said bared conductors supported by the axle-box of the vehicle, and suitable guides for said collectors to admit of lateral motion, substantially as and for the purpose specified.

3. In an electric railway, the combination of a stationary source of electric supply, bared working-conductors extending along the path of the vehicle running upon said railway, an electrically-propelled vehicle, and two independent depending collectors to receive electricity from said bared conductors supported in line of travel of the vehicle, and each carried by a different axle-box and arranged substantially in a vertical plane through the respective axles.

4. In an electric railway, the combination of a stationary source of electric supply, bared working-conductors extending along the path of the vehicle running upon said railway, an electrically-propelled vehicle, two independent depending and laterally-movable collectors to receive electricity from said bared conductors supported in line of travel of the vehicle, and each carried by a different axle-box and arranged substantially in a vertical plane through the respective axles.

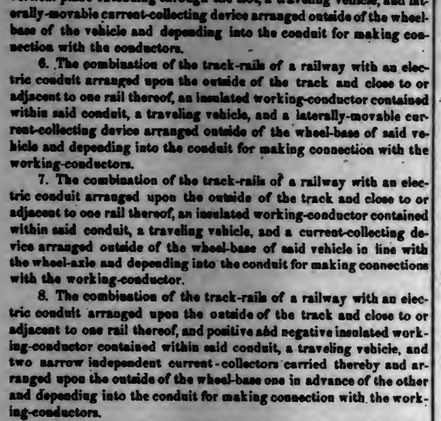
5. The combination of the track-rails of a railway with an electric slotted conduit arranged upon the outside of the track and close

to or adjacent to one rail thereof, and positive and negative bared conductors contained within said conduit and consisting of longitudinal bars, having vertical or substantially vertical faces exposed to a vertical plane extending through the slot, a traveling vehicle, and laterally-movable current-collecting device arranged outside of the wheel-base of the vehicle and depending into the conduit for making connection with the conductors.

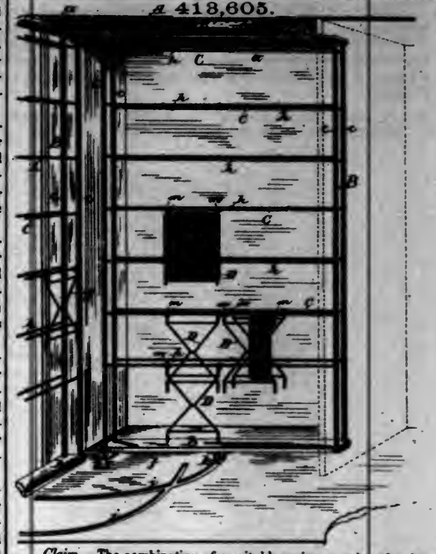
6. The combination of the track-rails of a railway with an electric conduit arranged upon the outside of the track and close to or adjacent to one rail thereof, an insulated working-conductor contained within said conduit, a traveling vehicle, and a laterally-movable current-collecting device arranged outside of the wheel-base of said vehicle and depending into the conduit for making connection with the working-conductors.

7. The combination of the track-rails of a railway with an electric conduit arranged upon the outside of the track and close to or adjacent to one rail thereof, an insulated working-conductor contained within said conduit, a traveling vehicle, and a current-collecting device arranged outside of the wheel-base of said vehicle in line with the wheel-axle and depending into the conduit for making connections with the working-conductor.

8. The combination of the track-rails of a railway with an electric conduit arranged upon the outside of the track and close to or adjacent to one rail thereof, and positive and negative insulated working-conductor contained within said conduit, a traveling vehicle, and two narrow independent current-collectors carried thereby and arranged upon the outside of the wheel-base one in advance of the other and depending into the conduit for making connection with the working-conductors.



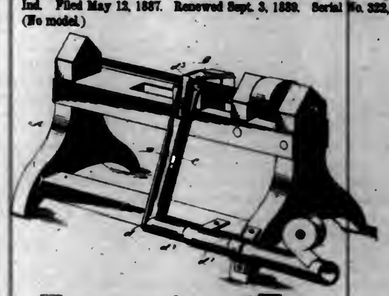
9. The combination of the track-rails of a railway with an electric conduit arranged upon the outside of the track and close to or adjacent to one rail thereof, and positive and negative insulated working-conductors contained within said conduit, a traveling vehicle, and two independently adjustable or movable current-collectors carried thereby and arranged upon the outside of the wheel-base one in advance of the other and depending into the conduit for making connection with the working-conductors.



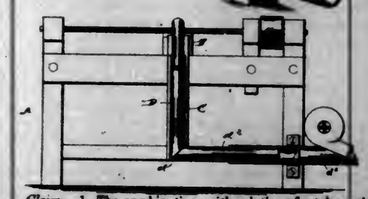
10. The combination of the track-rails of a railway with an electric conduit arranged upon the outside of the track and close to or adjacent to one rail thereof, and positive and negative insulated working-conductors contained within said conduit, a traveling vehicle having a car-body supported on springs, and two current-collectors carried thereby independently of the car-body and arranged upon the outside of the wheel-base one in advance of the other and depending into the conduit for making connection with the working-conductors.

11. The combination of a railway-track with a slotted conduit arranged upon the outside thereof and a bared conductor contained within said conduit and exposing its contact-surface from the side, a traveling vehicle, and a depending current-collecting device adapted to make contact with the conductor and carried by the vehicle with provision for lateral movement.

12. The combination of a railway, a slotted conduit arranged outside of the track, a bared working-conductor supported within said conductor and insulated therefrom, and tie-rods connecting the upper part of the conduit to the track, whereby it is maintained in relative fixed position with respect to the rail.

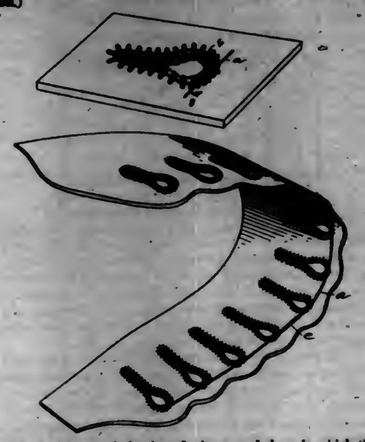


413,605. RACK FOR EXHIBITING LACES. CASPAR H. KROSSER, Milwaukee, Wis. Filed May 17, 1888. Serial No. 202,410. (No model.)



Claim.—The combination of a suitable casing, a series of swinging frames arranged within the casing, a series of transverse rods connected to each frame, a series of stops arranged on each of the rods, and a series of rails provided with hooks for engagement with said rods between the stops thereon, substantially as set forth.

413,606. LATHE DUST-TRAP. JOHN J. METFORD, Indianapolis, Ind. Filed May 12, 1887. Renewed Sept. 3, 1889. Serial No. 322,852. (No model.)



Claim.—1. The combination, with a lathe, of a telescoping dust-collecting pipe having one section secured to the carriage of the lathe and the other section secured to a fixed support, substantially as set forth.

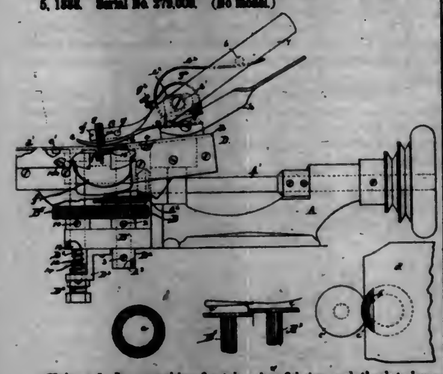
2. The combination, with a lathe, of the pipe D, having the enlarged section d', the section d^3, telescoping therein, and the hood d^2, and the sliding frame C, secured to the carriage of the lathe and supporting the section d^3, substantially as described.

3. The combination, with a lathe, of the pipe D, having a telescoping joint and a hood d^2 arranged over the cutting-tools, the frame C, supporting one end of the pipe and secured to the lathe-carriage, and means for causing a section in said pipe, substantially as described.

4. The combination, with the movable carriage of a lathe, of a telescoping dust-conveying pipe connected to said carriage and controlled thereby, and means for causing a section in said pipe, substantially as set forth.

413,607. BUTTON-HOLE PIECE FOR BOOTS OR SHOES. ROBERT H. PERLEY, Lynn, Mass. Filed May 20, 1889. Serial No. 278,314. (No model.)

Claim.—1. A button-hole piece for boots and shoes in which the ends of the button-hole stitches are at the eye or draw end of the button-hole, substantially as described.



2. A button-hole piece for boots and shoes in which the ends of the button-hole stitches are at the eye or draw end of the button-hole and overlap, substantially as described.

3. A button-hole piece for boots and shoes in which the ends of the button-hole stitches are at the eye or draw end of the button-hole and are combined with a stay-cord the ends of which are also at the eye or draw end of the button-hole and are laid from the said end of one button-hole to that of another, substantially as described.

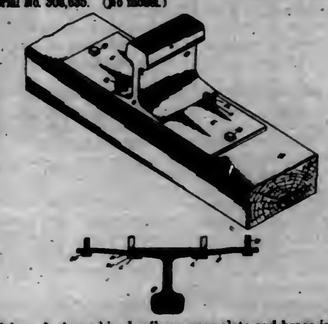
4. A button-hole piece for boots and shoes in which the ends of the button-hole stitches are at the eye or draw end of the button-hole and are combined with a stay-cord also overlapping at the eye or draw end of the button-hole, substantially as described.

5. A button-hole piece for boots and shoes in which the button-hole stitches are at the eye or draw end of the button-holes and are combined with a stay-cord the ends of which are also at the eye or draw end of the button-hole and are laid from said draw end of one to that of another and are tied down by a line of stitches, substantially as described.

418,608. MACHINE FOR TRIMMING FABRICS. WILLIAM F. BRAENDLER and CHARLES RUSSELL, New York, N. Y., assignors to the Manufacturer's Special Machine Company, Danbury, Conn. Filed July 5, 1888. Serial No. 279,008. (No model.)

Claim.—1. In a machine for trimming fabrics, a cloth-plate having a slot 4 extended through the same for a part of its width, combined with two rotating shear-cutters having overlapping edges, and bearings below the said cloth-plate for the shafts carrying the said cutters, substantially as described.

2. In a machine for trimming fabrics, two rotating cutters, one of which has a feeding-face, and means to rotate them, combined with a slotted cloth-plate to support the fabric above the said cutters, one portion of the cloth-plate being inclined with relation to the face or upper side of one of the cutters, whereby a portion of the face of one of the cutters is enabled to come against and feed the fabric, and with a presser to operate substantially as described.



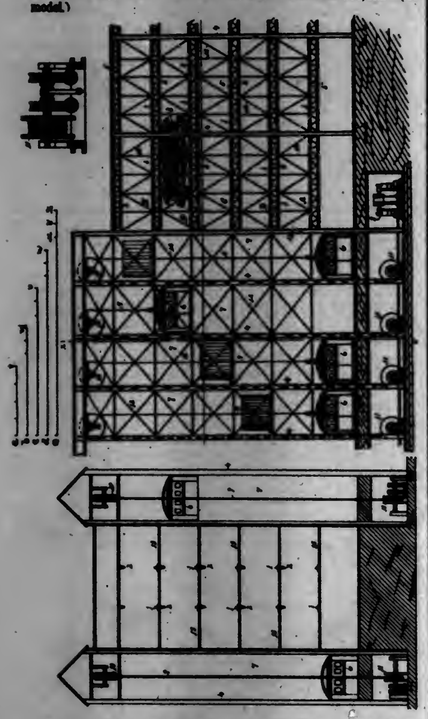
3. In a machine for trimming fabrics, two rotating cutters, one of which has a feeding-face, means to rotate them, and a spring to press the two cutters together, combined with a slotted cloth-plate to support the fabric above the said cutters, one portion of the cloth-plate being inclined with relation to the face or upper side of one of the cutters, whereby a portion of the face of one of the cutters is enabled to come against and feed the fabric, substantially as described.

4. In a machine for trimming fabrics, two rotating cutters, one of which has a feeding-face, means to rotate them, and the presser-foot e and roller g, combined with a cloth-plate to support the fabric above the said cutters, one portion of the slotted cloth-plate being inclined with relation to the face or upper side of one of the cutters, whereby a portion of the face of one of the cutters is enabled to come against and feed the fabric, substantially as described.

5. In a machine for trimming fabrics, two rotating cutters, one of which has a feeding-face, means to rotate them, and the presser-foot e and roller g, and guide 22, combined with a slotted cloth-plate to support the fabric above the said cutters, one portion of the cloth-plate being inclined with relation to the face or upper side of one of the cutters, whereby a portion of the face of one of the cutters is enabled to come against and feed the fabric, substantially as described.

6. In a machine for trimming fabrics, two rotating cutters, one of which has a feeding-face, means to rotate them, and the roller g, its arm 18, spring g^3, and adjusting-screw g^4, combined with a slotted cloth-plate to support the fabric above the said cutters, one portion of the cloth-plate being inclined with relation to the face or upper side of one of the cutters, whereby a portion of the face of one of the cutters is enabled to come against and feed the fabric, substantially as described.

413,609. RAILWAY WEAR-PLATE AND BRACE. LOUIS BLAKESTOCK, Jersey City, N. J., assignor of two-thirds to John A. Bensel, New York, N. Y., and Charles D. Haley, Newark, N. J. Filed Apr. 26, 1888. Serial No. 308,635. (No model.)



Claim.—1. A combined railway wear-plate and brace interposed between the rail and tie, and consisting of a plate provided upon its face with brace-shoulders or ribs receiving the rail between them and engaging the edges thereof for holding the rail against lateral movement, the plate formed with rail-spike openings offset from the line of contact of the rail-base with the shoulders, so that lateral contact between the rail and spikes is prevented, whereby cutting away of the spikes is avoided, substantially as hereinbefore set forth.

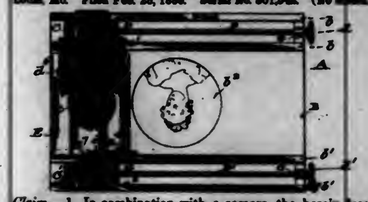
2. The combination, with a railway-rail and a tie, of a combined wear-plate and rail-brace consisting of a plate interposed between the rail and tie and formed with spike-openings, and provided upon its face with two extended parallel shoulders or ribs forming a seat for the rail-base and receiving the entire side-thrust of the rail, the rail-spikes passing through said openings into the tie and engaging with their head-flanges the rail-base, and fasteners for holding the plate to the tie, whereby the spikes are wholly relieved of the lateral hammering and rubbing of the rails and the rail is prevented from cutting into the tie, substantially as hereinbefore set forth.

3. The combination, with the rail 2 and the tie 15, of the plate 6, placed between the rail and tie and bolted to the latter, and provided with the two parallel shoulders or ribs 7 7, engaging the edges of the rail-base and receiving the entire side-thrust of the rail, the spike-openings 11 11, offset from the shoulders 7 7, and the rail-spikes 12 12, taking through openings 11 11 and engaging the rail-base with their heads, so as not to receive the side-thrust of the rail, but to

prevent the same from rising, substantially as and for the purpose set forth.

418,610. ELEVATED-RAILWAY SYSTEM. ELIAS M. BOYNTON, West Newbury, Mass. Filed Nov. 21, 1888. Serial No. 291,462. (No model.)

Claim.—1. In a railway system, a series of tracks at different levels, one above the other, said levels terminating at points successively nearer to the beginning, each level being adapted for the passage of through trains in both directions and provided beyond the end of the next shorter level with stations and passenger-platforms, in combination with series of elevators placed at suitable distances apart and leading to all the levels, and platforms at each level, affording convenient access to the cars.

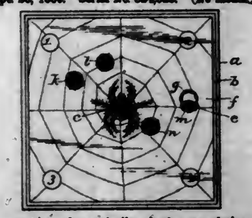


2. In a railway system, a double series of horizontal passenger conveyances and guides or tracks therefor arranged vertically, one above the other, each pair of tracks upon the same level being adapted for the passage of conveyances in both directions at the same time, and said tracks terminating at different points or stations, combined with a corresponding series of vertical guides or ways and passenger conveyances therefor, adapted to run from a common level each to one of said horizontal conveyances, and actuating mechanism for said vertical conveyances, substantially as set forth.

3. In a railway system, a double series of horizontal passenger conveyances and guides or tracks therefor arranged vertically, one above the other, each track consisting of a single bottom rail and a top support, each pair of tracks upon the same level being adapted for the passage of conveyances in both directions at the same time, and said tracks terminating at different points or stations, combined with a corresponding series of vertical guides or ways and passenger conveyances therefor, adapted to run from a common level each to one of said horizontal conveyances, and actuating mechanism for said vertical conveyances, substantially as set forth.

4. In a railway system, a double series of tracks arranged vertically, one above the other, and terminating at points successively nearer to the beginning, the lower track being the longer, and station-platforms for each track beyond the terminus of the next higher track, substantially as set forth.

5. In a railway system, a double series of tracks arranged vertically, one above the other, each track consisting of a single bottom rail and a top support terminating at points successively nearer to the beginning, the lower track being the longer, and station-platforms for each track beyond the terminus of the next higher track, substantially as set forth.

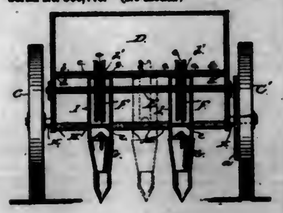


418,611. PHOTOGRAPHIC VIGNETTER. AARON W. CLARK, St. Louis, Mo. Filed Feb. 28, 1889. Serial No. 301,542. (No model.)

Claim.—1. In combination with a camera, the herein-described photographic vignetter, the same consisting of the two masks and their support, said support having an opening opposite the lens, said masks being independently adjustable vertically and laterally upon said support, and one of said masks consisting of a transparent plate having an opaque vignetter arranged centrally thereupon, and the other of said masks being opaque and having a serrated edge, substantially as and for the purpose set forth.

2. The combination of the two masks and their support, said support having an opening b^3, said masks being independently adjustable laterally upon said support, and one of said masks consisting of a transparent plate having an opaque vignetter, and the other of said masks being opaque and having a serrated edge, substantially as described.

418,612. TOY OR PUZZLE. CHARLES M. CRANDALL, Waverly, N.Y. Filed Sept. 20, 1889. Serial No. 324,523. (No model.)

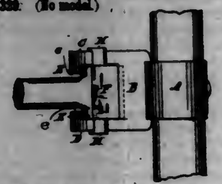


Claim.—1. A puzzle or similar device consisting of an inclosure containing two or more bodies of different specific gravity movable therein, one of which is arranged to come in contact with and shift the other and to deposit it at various points upon the surface it travels over, substantially as described.

2. In a puzzle or similar device, an inclosure containing two or more movable bodies, one of said bodies being less responsive to variations in the level of the inclosure than the other, whereby the more active body is made to shift the other from place to place, in the manner and for the purpose described.

3. In a puzzle or similar device, an inclosure having a body of quicksilver arranged to traverse its floor, in combination with pieces of felt placed loosely upon the floor and adapted to be moved by said quicksilver, for the purpose substantially as described.

4. An inclosure closed upon all sides and having a transparent cover, a floor containing a depression, a body of quicksilver located upon the floor and adapted to enter the depression, and one or more lighter bodies of non-metallic substance adapted to be shifted by the quicksilver, as set forth.

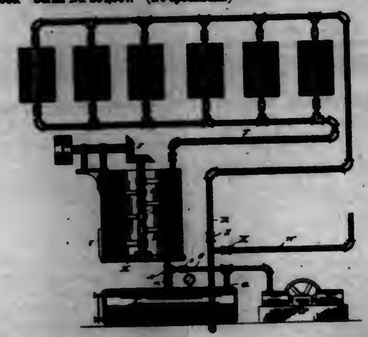


418,613. SEEDER AND PLANTER. JOHN S. DAVIS, Montgomery, Ala., assignor of one-half to Daniel S. Troy, same place. Filed May 6, 1889. Serial No. 309,776. (No model.)

Claim.—1. In seed-planters, a seed-box having its bottom formed of the removable plates *b* and the removable slotted plates *c*, a horizontal shaft, laterally-adjustable seed-disks thereon, and having their upper portions extending through the slotted plates, brushes operating against the peripheries of the disks, and the laterally-adjustable hoppers and drills, substantially as described.

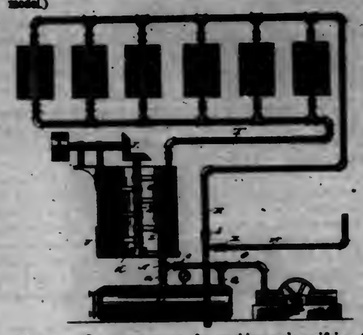
2. An improved seeding-machine comprising the main axle having the fixed and loose bearing-wheels and carrying the gear-wheel *c*, the seed-box having its bottom formed of the adjustable and removable plates *b* and *c*, a laterally-extending shaft having seed-disks adjustable thereon, said disks having peripheral seed-receptacles, brushes operating against the peripheries of the disks, a gear on the shaft, and idle gearing between said gear and the gear *c*, laterally-adjustable hoppers and drills, with spacing-thimbles or sleeves between them, a roller at the rear of the machine, and a connection between the roller and drills, whereby the depth of the latter is regulated, substantially as described.

418,614. THILL-COUPLING. GEORGE W. DICKEY, Cincinnati, Ohio, assignor of one-half to John Galster, same place. Filed Mar. 7, 1889. Serial No. 302,339. (No model.)



Claim.—In a thill-coupling, the combination, with the yoke B, attached to the clip A, provided with the inwardly-standing flanges E, and the vertical shoulders *e*, extending up from said flanges, having its inner surfaces between its joints recessed for the reception of the thill-head, and provided with the engaging-slots I, inclining slightly downward and forward and enlarged and rounded at their bottoms, of the thill-head F, cut away at G and provided with the flattened journals or bearings H to engage in the slots I, substantially as specified.

418,615. RATING. WILHELM DIETERLE, Feuerbach, near Stuttgart, Germany, assignor to I. Hauff, same place. Filed Nov. 14, 1888. Serial No. 290,785. (Specimens.)

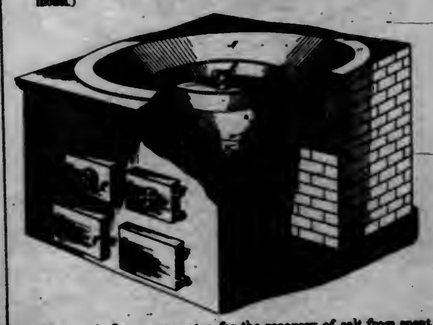


Claim.—The process herein described of neutralizing the lime contained in hides and swelling the same, which consists in treating the same with an aqueous solution of cresotinic acid, substantially as set forth.

418,616. PROCESS OF PURIFYING SALT RECOVERED FROM SPENT SOAP-LYES. ALBERT DOMMER and OTTO C. HAGEMANN, London, England, assignors to James S. Kirk & Co., Chicago, Ill. Filed Dec. 21, 1888. Serial No. 294,307. (No specimens.)

Claim.—The herein-described process of purifying salt recovered from spent soap-lye during concentration or the manufacture of crude glycerine therefrom, which consists in subjecting a convenient quantity of the salt to a series of washings with separate charges of a saturated aqueous solution of salt, said charges containing decreasing quantities of glycerine in solution, the first of said charges being drawn off with its dissolved glycerine and a fresh charge of a saturated solution of salt free of glycerine added to the series in lieu thereof for each quantity of salt treated, said fresh charge being used for final treatment, whereby each quantity of salt subjected to repeated washings and the separate charges of the solution are utilized repeatedly.

418,617. APPARATUS FOR TREATING SOAP-LYES. ALBERT DOMMER and OTTO C. HAGEMANN, London, England, assignors to James S. Kirk & Co., Chicago, Ill. Filed Dec. 21, 1888. Serial No. 294,308. (No model.)



Claim.—1. In an apparatus for washing and purifying the salt recovered from spent soap-lye, the combination of a cylinder to contain said salt, a series of tanks to contain an aqueous solution of salt and communicating with said cylinder, an exhaust chamber or vessel connected to said cylinder, and a pump connected with said exhaust-chamber, substantially as and for the purpose described.

2. In an apparatus for washing and purifying the salt recovered from spent soap-lye, the combination of a cylinder to contain the salt under treatment, having mechanical mixers mounted therein, a series of tanks communicating by suitable pipes and valves with said cylinder, an exhaust-chamber connected with the salt-cylinder, and a pump connected with said chamber whereby liquids contained in the cylinder may be drawn off and the salt dried, substantially as described.

3. In an apparatus for washing and purifying the salt recovered from spent soap-lye, the combination of a cylinder to contain the salt undergoing treatment, said cylinder having a perforate bottom, a series of tanks communicating with the cylinder, an exhaust-chamber connected with the cylinder, and an air-pump connected with said exhaust-chamber, substantially as described, and for the purpose set forth.

4. In an apparatus for washing and purifying salt recovered from spent soap-lye, the combination of a cylinder to contain said salt, a series of tanks to contain an aqueous solution of salt and communicating with said cylinder, an exhaust chamber or vessel connected to said cylinder, a pump connected with said exhaust-chamber, and a pipe to conduct the liquor from said exhaust-chamber to a storage-tank or other suitable receptacle, substantially as described.

418,618. APPARATUS FOR TREATING SOAP-LYES. ALBERT DOMMER and OTTO C. HAGEMANN, London, England, assignors to James S. Kirk & Co., Chicago, Ill. Filed Dec. 21, 1888. Serial No. 294,309. (No model.)

Claim.—1. In an apparatus for the recovery of salt from spent lye, the combination of an open vessel to contain the lye and a heating means exterior to said vessel and adapted to heat the same and an inner and smaller deposit-vessel having an imperforate peripheral wall and bottom located within the first to receive and retain the salt or other solid deposit, substantially as described.

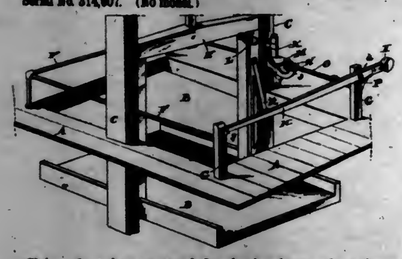
2. In an apparatus for the recovery of salt from spent lye, comprising in combination an outer vessel to contain the lye and means

for applying heat thereto and an inner vessel smaller than and supported within the first for the reception of the salt or other deposit, said outer vessel being provided with a pocket, substantially as and for the purpose set forth.

3. In an apparatus for the recovery of salt from spent soap-lye, the combination, with an outer vessel to contain the lye and means for heating the same, of an inner vessel wherein to collect the salt or other deposit, said inner vessel having a central pipe, substantially as described.

413,619. PROCESS OF RECOVERING GLYCERINE FROM SPENT SOAP-LYES. ALBERT DOBEREK and OTTO C. HAGENAHN, London, England, assignors to James S. Kirk & Co., Chicago, Ill. Filed Mar. 9, 1889. Serial No. 302,644. (No specimens.)

Claim.—1. In the process of treating spent soap-lye for the purpose of obtaining glycerine and other products therefrom, the improvement which consists in first treating the lye with lime or other oxides to precipitate insoluble soaps, removing the precipitate thus formed, next neutrafizing the lye with acid to precipitate albuminous bodies, then adding soluble metallic salts to decompose any remaining soapy matters, next adding metallic oxides to completely remove fatty bodies, then removing the precipitates, and finally concentrating the clear liquor, as set forth.



2. In the process of treating spent soap-lye for the purpose of obtaining glycerine and other products therefrom, the improvement which consists in first treating the lye with lime or other oxides to precipitate soaps, removing the precipitate thus formed, next neutralizing the lye with acid to precipitate albuminous bodies, then adding a mixture of metallic oxides and soluble metallic salts to completely remove soapy and fatty bodies, next removing the precipitates thus formed, and finally concentrating the clear liquor, as set forth.

3. In the process of treating spent soap lye for the purpose of obtaining glycerine and other products therefrom, the improvement which consists in first neutralizing the lye with acid to precipitate albuminous bodies, then adding soluble metallic salts to decompose the soapy matters, next adding metallic oxides to completely remove fatty bodies, then removing the precipitates, and finally concentrating the clear liquor, as set forth.

4. In the process of treating spent soap-lye for the purpose of obtaining glycerine and other products therefrom, the improvement which consists in first neutralizing the lye with acid to precipitate albuminous bodies, then adding a mixture of metallic oxides and soluble metallic salts to completely precipitate the soapy and fatty bodies, next removing the precipitate thus formed, and finally concentrating the clear liquor, as set forth

---

413,620. ELEVATOR-HATCHWAY GATE. CHARLES S. ROOCK, Cincinnati, Ohio, assignor to Morse, Williams & Co. Filed June 17, 1889. Serial No. 314,607. (No model.)

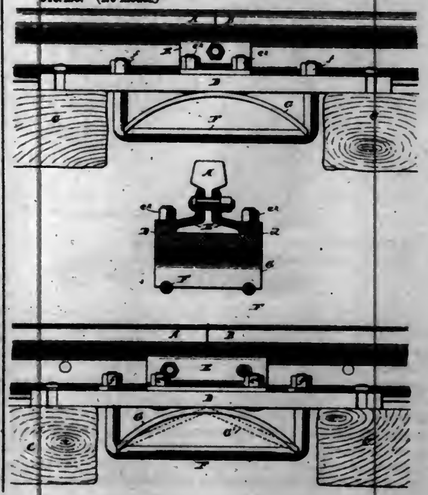
Claim.—1. A bar or guard for the hatchway of an elevator, pivoted to a support to normally assume an upright position, in combination with an arm pivoted to said support at a distance from the pivot-point of the bar and normally pressing upon said bar to force it into and hold it into a lowered or closed position, and mechanism controlling said arm projecting into the path of the elevator and operated thereby to remove the pressure of said arm and allow the bar or guard to assume its normal upright position when the hatchway is closed by the elevator.

2. A bar or guard for the hatchway of an elevator, pivoted to a support to normally assume an upright position, in combination with an arm pivoted to said support at a distance from the pivot-point of the bar and normally pressing upon said bar to force it into and hold it in a lower or closed position, a spring to force said arm against the bar, and mechanism controlling said arm projecting into the path of the elevator and operated thereby to remove the pressure of said arm and allow the bar or guard to assume its normal upright position when the hatchway is closed by the elevator.

3. A bar or guard for the hatchway of an elevator-shaft, pivoted to a support and normally assuming a vertical position, in combination with a rod journaled in said support, having a locking-arm adapted to press upon said bar to close it and lock it in a closed position, mechanism to rotate said rod and its arm, projecting into the path of the elevator, and a cam carried by the elevator-cage to operate said projecting mechanism and unlock the bar.

4. A bar or guard for the hatchway of an elevator, pivoted to a support to normally assume an upright position, in combination with an arm pivoted to said support at a distance from the pivot-point of the bar and normally pressing upon said bar to force it into and hold it in a lowered or closed position, and mechanism controlling said arm projecting into the path of the elevator, the elevator-cage, and a cam projection carried thereby to operate said projecting mechanism to remove the pressure of said arm and allow the bar or guard to assume its normal upright position when the hatchway is closed by the elevator.

5. A bar or guard for the hatchway of an elevator-shaft, pivoted to a support to normally assume an upright position, in combination with a crank-arm journaled in said support and adapted to press upon said bar to force it into and hold it in a lowered or closed position, an extension positively connected with said crank-arm, a spring to normally force said crank-arm against the bar, and mechanism controlled by the elevator adapted to operate said extension of the crank-arm against the action of the spring to release the guard and allow it to rise or open.



6. A bar or guard for the hatchway of an elevator-shaft, pivoted to a support and normally assuming a vertical position, in combination with a rod journaled in said support, having a locking-arm adapted to press upon said bar to close it and lock it in a closed position, mechanism to rotate said rod and its arm, projecting into the path of the elevator, a cam carried by the elevator-cage to operate said projecting mechanism and unlock the bar, and a spring carried by said rod to force its arm upon the bar and close and relock it after the elevator has passed the hatchway.

7. A bar or guard for the hatchway of an elevator-shaft, pivoted to a support to normally assume an upright position, in combination with a crank-arm journaled in said support and adapted to press upon said bar to force it into and hold it in a lowered or closed position, an extension connected with said crank-arm, a spring to normally force said crank against the bar, a pinion carried by said extension, a projection in the path of the elevator, a rack connected with said projection and gearing with the pinion, and a cam device carried by the elevator adapted to push said projection to operate the crank-arm and permit the bar or guard to rise and assume its normal or opened position.

413,621. HOOF-PACKING. NEWTON R. GLAISTER, Boston, Mass. Filed Aug. 29, 1889. Serial No. 322,356. (No specimens.)

Claim.—The herein-described composition of matter to be used as a packing or stuffing in, under, or about horses' feet, consisting of peat moss, vaseline, and carbolic acid, substantially in the proportions specified.

413,622. RAIL-JOINT. JAMES M. JOHNSON, Chicago, Ill., administrator of Richard Long, deceased. Filed May 11, 1889. Serial No. 310,453. (No model.)

Claim.—1. In a rail-joint support, a spring-truss arranged to support the ends of the rails, adjustable for regulating the tension of the truss, substantially as described.

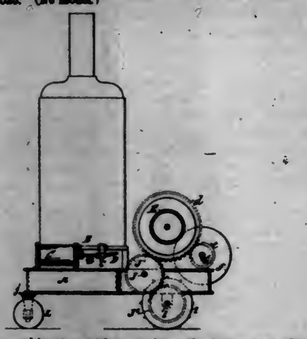
2. In a rail-joint support, a spring-truss consisting of a spring member and a longitudinal tension member for said spring, substantially as described.

3. In a rail-joint support, a truss consisting of a spring member arranged to support the rails at their point of junction, and a supporting frame for the spring member affording abutments united by a longitudinal member for the ends of the said spring member, substantially as described.

4. A rail-joint support consisting of a spring member supporting the rails at their point of junction, and a frame or supporting member, said supporting member being adjustable for regulating the tension of the spring member, substantially as described.

5. In a rail-joint support, a truss consisting of an arched spring member and a supporting member, said supporting member being adjustable for regulating the tension of the arched member upon the rails, substantially as described.

6. In a rail-joint support, a truss consisting of an arched member arranged directly under the point of junction of the rails, and a frame or supporting member suspended below the rails, forming abutments for the ends of the arched member, substantially as described.



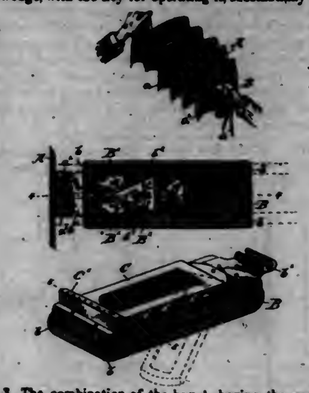
7. In a rail-joint support, a truss consisting of an arched plate of spring material, a yoke or U-bolt piece supporting said arched member, and adjusting-nuts for said yoke-piece, substantially as described.

8. In a rail-joint support, the combination, with the rails of a channeled base-piece, a truss consisting of a spring member bearing against the base-piece, and a yoke or frame supporting the spring member and connected to the base-piece, substantially as described.

9. In a rail-joint support, the combination, with the rails, of a channeled base-piece, angle-plates secured to said base-piece and to the rails, and a truss consisting of an arched member, the center of the arched member being connected to the base-plate adjacent to the junction of the rails, and the ends of the arched member being connected to be supported by the base-plate, substantially as described.

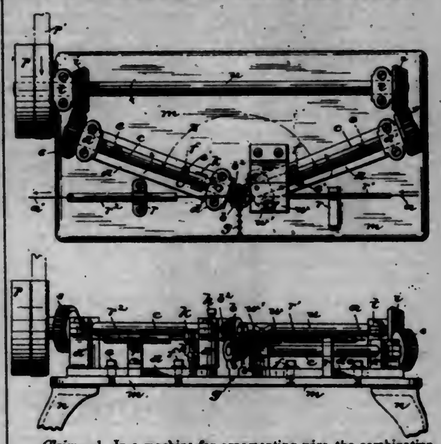
10. In a rail-joint support, the combination, with the rails of the channeled base-plate, the angle-plates having a central bolt passing through recesses in the adjacent webs of the rails and secured to the base-plate, and a truss for supporting the base-plate at or near the point of junction of the rails, substantially as described.

413,623. HOISTING-MACHINE. FRANKLIN DE F. LOOMIS, Brooklyn, N. Y., assignor to Thomas F. Krajewski and James L. Cochrane, same place, and Alfonso Pemart, Havana, Cuba. Filed Dec. 10, 1887. Serial No. 257,523. (No model.)



Claim.—The combination, with an engine and a frame upon which said engine is mounted, of an axle journaled in said frame, a driving-wheel rigidly mounted on said axle, a wheel loosely mounted on said axle, a crank-shaft having a pitman-connection with the engine, a gear-wheel on the crank-shaft, a gear-wheel on the axle, and an intermediate shaft having an endwise-movable gear-wheel thereon, substantially as specified.

413,624. MAIL-BAG LOCK. JOHN P. MANN, Indianapolis, Ind., assignor of two-thirds to Bruce Carr and Harvey M. La Follette, same place. Filed Mar. 14, 1889. Serial No. 303,223. (No model.)



Claim.—1. In a bag-lock, the combination of the casing, two pivoted dogs therein with their faces arranged adjacent to the tie-cord, a sliding wedge arranged between said dogs, and a cam mounted to bear against a portion of said wedge for operating it, substantially as set forth.

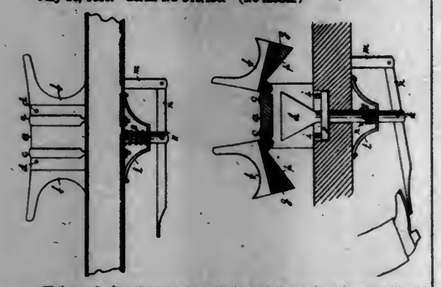
2. In a bag-lock, the combination of the casing B, the dogs B', pivoted therein, the sliding wedge B^2, and the cam B^3, arranged behind said wedge, with the key for operating it, substantially as set forth.

3. The combination of the bag A, having the cord *a* interlaced through its top, the casing B, hinged to said bag, the free ends of said cord passing through apertures therein, the pivoted dogs B', with their faces adjacent to said cord, the sliding wedge B^2, arranged between said dogs, and the cam-lock B^3 behind said wedge, all substantially as set forth.

413,625. MACHINE FOR ORNAMENTING WIRE. SAMUEL MOORE, Providence, R. I., assignor of one-half to Charles D. Reynolds, same place. Filed Mar. 16, 1889. Serial No. 303,538. (No model.)

Claim.—1. In a machine for ornamenting wire, the combination of two engraved rolls mounted on shafts arranged in different planes and forming an obtuse angle with each other and mechanism for revolving the rolls, substantially as hereinbefore described, and for the purpose set forth.

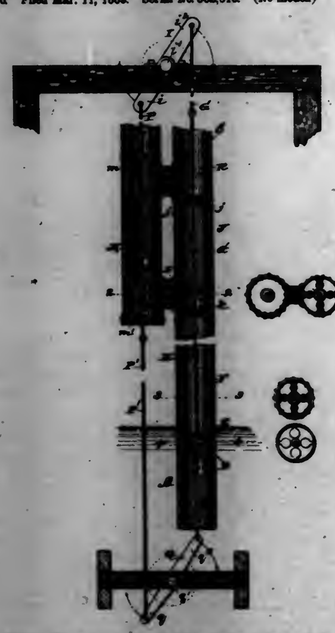
2. In a machine for ornamenting wire, the combination of two simultaneously-driven engraved rolls *b*, mounted one above the other in different parallel planes, the axes of the rolls crossing each other and forming obtuse angles, and guides for maintaining the wire in position during its passage through said rolls, substantially as shown, and hereinbefore described.



3. In a machine for ornamenting wire, the combination of two simultaneously-driven obliquely-arranged engraved rolls *b*, mounted one above the other in different but parallel planes and having the axes of the rolls cross each other, means for changing the angular relation of the rolls, and guides for maintaining the wire in position during its passage through the rolls, substantially as shown and described.

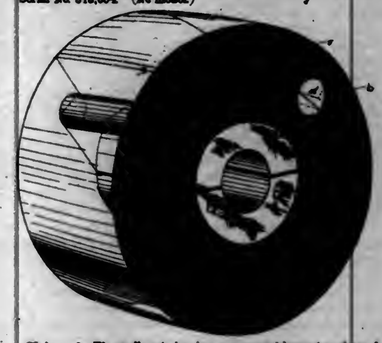
4. In a machine for ornamenting wire, the combination of two simultaneously-driven obliquely-arranged engraved rolls *b*, mounted one above the other in different planes and having crossed axes revolving in the same direction, and a guided wire simultaneously acted

upon by both rolls, which at the same time impress the pattern spirally into the wire's surface, thereby automatically revolving the wire and feeding it ahead, substantially as hereinbefore described.



5. In a machine for ornamenting wire, the combination, with a laterally-adjustable frame and the lower engraved roll mounted and revolving therein, of an oppositely-located and laterally-adjustable frame, a vertically-adjustable driven shaft mounted therein, an engraved roll secured to the shaft and forming a crossed axis with the lower roll, and guides for maintaining the wire in position between the rolls, substantially as hereinbefore described.

413,626. CLEAT FOR BOATS. HIRAM B. NICKERSON, New Bedford, assignor to George W. Eldridge, Vineyard Haven, Mass. Filed July 20, 1889. Serial No. 318,156. (No model.)

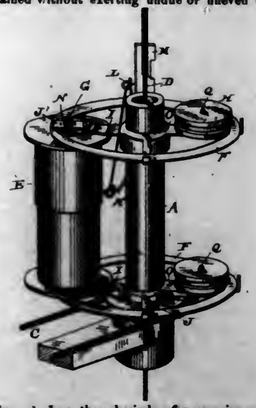


Claim.—A cleat for boats, consisting of the body *a*, having hinged to it the wings *b*, provided with inclined surfaces *p*, and having holes *g*, and the standard *k*, having pins *i* to engage with the holes *g*, and having the head *h*, with inclined sides adapted to bear against the inclined surfaces of the wings, and provided with a spring to retain the pins *i* in engagement with the holes *g*, and means whereby the pins *i* and head *h* are caused to release and throw out the wings in order to cast loose the line made fast to the cleat, substantially as shown and described.

413,627. WATER-HOIST. ALEXANDER HIEDRINGHAM, St. Louis, Mo. Filed Mar. 11, 1889. Serial No. 302,810. (No model.)

Claim.—The combination, with the lower cylinder A, the tube H, vertically above the said cylinder and separated therefrom by the valve E, the reservoir-partition J, vertically above said tube and separated therefrom by the valved partition K, the upper cylinder M, connected to the reservoir by the valved tube L above the partition K, and the tube S, vertically above the reservoir, separated therefrom by a partition, and communicating with the cylinder M through a valved tube, of the two pistons, the double-armed pivoted levers, and the connections from the arms of said levers to the pistons and piston-rods, substantially as specified.

413,628. PULLEY. GEORGE PHILLIPS, Mishawaka, Ind., assignor to the Dodge Manufacturing Company, same place. Filed June 10, 1889. Serial No. 313,654. (No model.)



Claim.—1. The pulley A, having a removable wedge-shaped gap-section *c* on one side, provided with interlocking shoulders and keys *d*, whereby said section may be securely retained in place.

2. A pulley A, having cut from one side a double wedge-shaped section with interlocking shoulders, combined with wedge-shaped keys *d*, to retain said section in place and force the same toward the center to clamp the pulley on the shaft.

3. A pulley A, having a removable gap-section, whereof the narrowest part equals the diameter of the center or shaft-bore, said section and pulley being provided with interlocking portions adapted to receive wedge-keys to force said pulley and section together and clamp the same upon the shaft, substantially as set forth.

413,629. MACHINE FOR COVERING WIRE. WILLIAM A. PHILLIPS, Schenectady, N. Y., assignor to the Edison Machine Works, same place. Filed Apr. 10, 1889. Serial No. 306,695. (No model.)

Brief.—The object of the invention is to enable a high speed to be maintained without exerting undue or uneven tension upon the thread.

Claim.—1. In a thread-winder for covering wire, the combination of a central spindle, means adapted to revolve a supply-bobbin around said spindle, and a guide for said supply-bobbin in its revolution around said spindle additional to and independent of the revolving means, substantially as set forth.

2. In a thread-winder for covering wire, the combination of a central spindle, means adapted to revolve a supply-bobbin around said spindle, and a ring-guide for said supply-bobbin in its revolution around said spindle, substantially as set forth.

3. In a thread-winder for covering wire, the combination of a central spindle, means adapted to revolve a supply-bobbin around said spindle, and a guide for said supply-bobbin in its revolution around said spindle free to rotate, the axis of said bobbin being in contact with said guide, substantially as set forth.

4. In a thread-winder for covering wire, the combination of a central spindle, a carrier adapted to carry each end of a supply-bobbin, said carrier being rotated by said central spindle, and a guide-ring loosely supported on each of said carriers, the axis of said bobbin being in contact with the inner periphery of said guide-ring, substantially as set forth.

5. In a thread-winder for covering wire, the combination of a central spindle, arms carried by said spindle adapted to carry a supply-bobbin, a guide-ring loosely supported on each of said arms, the axis of the bobbin in contact with said arms and the inner periphery of said rings, and means on one of said arms for retaining said axis in contact with said ring, substantially as set forth.

6. In a thread-winder for covering wire, the combination of a central spindle, means adapted to revolve a supply-bobbin around said spindle, a guide-ring for said bobbin in its revolution around said spindle, free to rotate, and means for centering said guide-ring with relation to said spindle, substantially as set forth.

7. In a thread-winder for covering wire, the combination of a central spindle, means adapted to revolve a supply-bobbin around said spindle, an independent guide for said supply-bobbin in its revolution around said spindle, an arm, and a counter-weight carried by said arm, located diametrically opposite said bobbin and revolving with it around said central spindle, substantially as set forth.

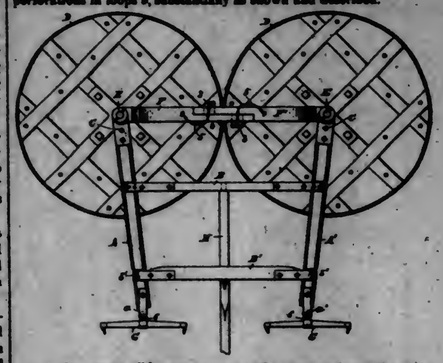
8. In a thread-winder for covering wire, the combination of a central spindle, means adapted to revolve a supply-bobbin around said spindle, an independent guide for said supply-bobbin in its revolution around said spindle, and a counter-weight for each end of the supply-bobbin revolving with said bobbin, substantially as set forth.

9. In a thread-winding machine, the combination of a central spindle, means adapted to revolve a supply-bobbin around said spindle, a guide-ring for each end of the spindle of the supply-bobbin, a supporting-arm for each guide-ring rotating with said central spindle, a bearing for each end of the spindle of the supply-bobbin, being formed by the supporting-arm and the inner periphery of the guide-ring, substantially as set forth.

10. In a thread-winding machine, the combination of a central spindle, means adapted to revolve a supply-bobbin around said spindle, a guide-ring for the upper end of the spindle of said supply-bobbin, an arm for supporting said guide-ring, means for centering the same, and means for preventing the same from leaving its supporting-arm, substantially as set forth.

11. In a thread-winder for covering wire, the combination of a central spindle, a supply-bobbin and counter-weight, carriers for said bobbin and counter-weight arranged about said spindle diametrically opposite to each other, a guide-ring, free to rotate, for said supply-bobbin, said ring being centered by the axis of the supply-bobbin at one point and the counter-weight at a point diametrically opposite, substantially as set forth.

12. In a thread-winder for covering wire, the combination of a central spindle, a supply-bobbin, a counter-weight for each end of the supply-bobbin, carriers for said bobbin and counter-weights, each of said counterweights being situated diametrically opposite one end of the bobbin, and a guide-ring for each end of the supply-bobbin, free to rotate, said rings being centered by the axis of the supply-bobbin at one point and the counter-weight at a point diametrically opposite, substantially as set forth.



13. In a thread-winder for covering wire, the combination of a central spindle, a supply-bobbin and counter-weight arranged about said spindle diametrically opposite each other, carriers for said supply-bobbin and counter-weight, and a guide-ring for said supply-bobbin, free to be rotated by the axis of the bobbin, said counter-weight comprising a roller in contact with said ring and free to be rotated by it, substantially as set forth.

413,630. ROTARY HARROW. GEORGE P. PRESTON, Lawrenceburg, Ky., assignor of one-third to Thomas J. Pell, same place. Filed June 17, 1889. Serial No. 314,282. (No model.)

Claim.—1. In a convertible rotatory harrow, the combination of the cross-pieces having eyes or loops on their ends with rotatory draft-bars passing through said loops, and means for securing said bars against rotation, as set forth.

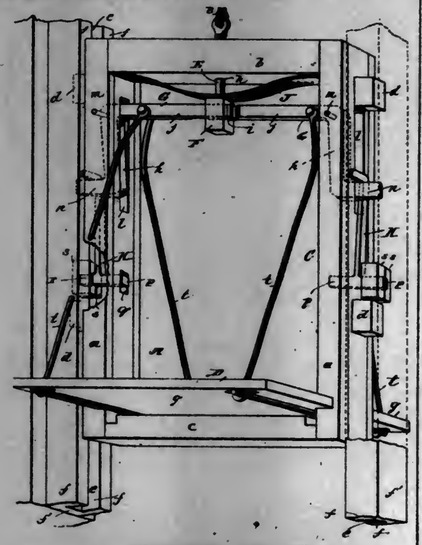
2. In a convertible rotary harrow, the combination of cross-bars B B', having loops *b b'* at their ends, rotatory draft-bars A A', passing through said loops and having bearings C rigidly attached to their rear ends, circular frames or wheels D, having axial pins E adapted to fit in said bearings C, and detachable cross bar F F' for retaining the parts in position, as set forth.

3. In a convertible harrow, the combination of the cross-bars B B', rotatory draft-bars A A', wheels D, and detachable cross-bar F F', with pins 2, adapted to engage with the perforations in lugs 3 or with perforations in loops *b*, substantially as shown and described.

4. In a convertible rotary harrow, the combination of the cross-bars B B', rotatory draft-bars A A', and wheels D, rotating on axles E, with the singletrees G, attached to head *a a'* by means of single pin 6, whereby the singletree is always horizontal, substantially as shown and described.

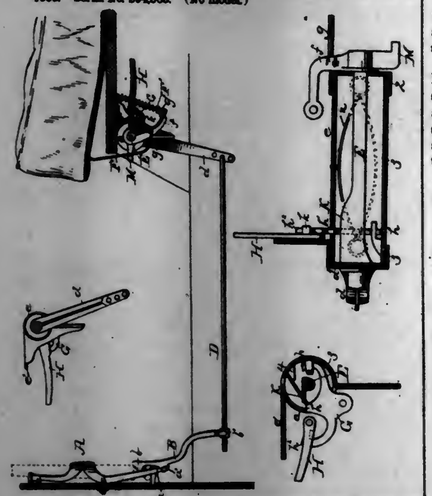
413,631. STRAM-BRAKE. TREAT T. PRESSER, Lake Side, Ill., assignor, by mesne assignments, to himself, Allen A. Griffith, Jr., and Frank Sayre Osborne. Filed Mar. 5, 1889. Serial No. 302,020. (No model.)

Claim.—1. In the piston-head of a fluid-motor, the combination of a valve placed in said piston-head in a hole therein of larger diameter than said valve, a stem on said valve moving freely in a hole extending from said first-named hole to the face of said piston-head, said valve-stem having therein ways extending from the face thereof to a groove in front of the valve thereon, and a spring holding said valve against the seat thereof, all substantially as described.



2. In the piston-head of a fluid-motor, the combination of valve F, stem G, having holes I therein and groove H thereon, valve-seat *d*, and spring J, whereby, when the pressure of said fluid against said valve and stem actuates said spring, such fluid may pass through said piston-head, all substantially as described.

413,632. SAFETY DEVICE FOR ELEVATORS. BENAIAH REID, Westfield, Mass., assignor of one-third to James Noble, Jr., same place. Filed July 1, 1889. Serial No. 316,147. (No model.)



Claim.—1. The combination, with the vertical ways of the elevator-hoistway and separable friction engaging blocks normally movable freely therein, of the elevator consisting of two parts, one a frame and the other the elevator car or platform, adapted for vertical movement on said frame, angular levers G G, pivotally mounted on said frame, and by their inner members each connected to and upwardly held by the hoisting-cable and having their other members of wedge form, levers H, having a supporting engagement with said frame and adapted to be engaged by the wedge-formed members of said angular levers, and provided with the angular members *r* of cam form, disposed between said separable friction engaging blocks, suspension means for supporting the car or platform from said levers G, and the spring applied to react on said levers G, substantially as described.

2. The combination, with the vertical ways of the elevator-hoistway and the separable friction engaging blocks normally freely movable therein, of the elevator consisting of two parts, one the frame C, comprising the vertical uprights *a a*, having guiding-tongues *d d* and slots *q q* therein, and the cross-beam *b*, and the other part comprising the floor or platform vertically movable in said frame C, the spindle E, vertically movable through said cross-beam *b*, to the upper end of which the hoisting-cable is attached, the levers G G, pivotally supported on said frame C, and by their upper arms each connected to said spindle and having their lower arms *n* of wedge form, suspension means between said levers and said platform, the levers H, adapted to be engaged by said wedge-shaped arms *n*, having transverse stem-

bers *p p* engaging said slots, and also having the transverse members *r r* of cam form disposed between said friction engaging blocks, and the spring J, substantially as described.

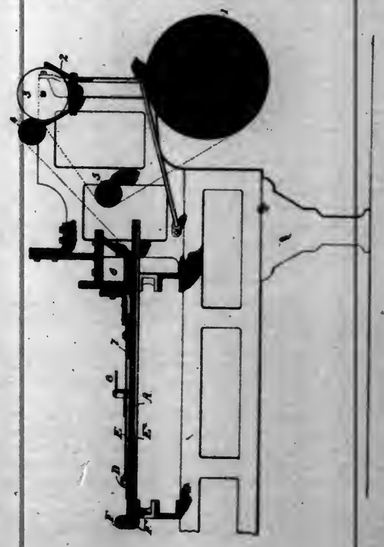
413,683. WHIP-SOCKET. GEORGE H. SPAULDING, Lake View, assignor of one-half to William J. Lukens, Cook County, Ill. Filed Dec. 26, 1888. Serial No. 294,583. (No model.)

Claim.—1. The combination, with a whip-socket having its lower end above the platform, upon which the whip rests open and having the legs *a a* extending parallel downward therefrom and connected at their lower ends by a transverse bar, of the lever B, having barbs projecting laterally and inward from either side of its upper end and fulcrumed on said transverse bar, so that when properly oscillated its upper end passes into said open lower end of the whip-socket and bites or embraces the whip, and the rod D, pivotally connected to the lower extremity of said lever and extending horizontally backward a suitable distance, as and for the purpose set forth.

2. A whip-socket constructed as described, in combination with lever B, fulcrumed in the lower end of said socket and oscillating through the lower open end of said socket, so as to lock the whip therein, a rod D, arms *d*, spindle E, case *c*, in which said spindle is journaled, arm *f*, having a stud *g* projecting therefrom in a direction parallel with said spindle, and spring F, which is secured transversely to the upper surface of a vehicle-seat, arising therefrom as it approaches the forward edge thereof, then pursuing a downward course in front of said seat, and having its lower end hooked and pressed upward against said stud *g*.

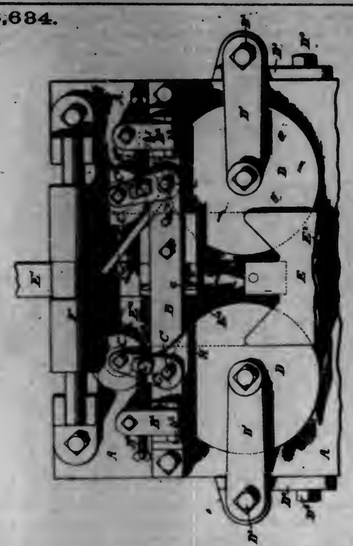
3. A whip-socket constructed as described, in combination with lever B, fulcrumed so that its upper end oscillates through lower end of said socket and locks the whip therein, rod D, spindle E, arm *d*, projecting from one end of spindle and to the end of which the rear end of said rod is pivotally connected, case *c*, in which said spindle is journaled, L-arm *f*, spring *g'*, stud *g*, projecting from said arm *f*, and spring F, the hooked lower end of which presses upward against said stud *g*, as and for the purpose set forth.

4. A whip-socket constructed as described, in combination with lever B, the upper end of which, when properly oscillated, locks the whip in the socket, rod D, arm *d*, spindle E, having a shelf projecting laterally therefrom, case *c*, in which said spindle is journaled, and tumbler G, substantially as and for the purpose set forth.



5. A whip-socket constructed as described, in combination with lever B, the upper end of which, when properly oscillated, locks the whip in said socket, rod D, arm *d*, spindle E, having a shelf projecting laterally therefrom, case *c*, spring within said case in which said spindle is journaled, the laterally-oscillating tumbler G, having spurs *h'* and h^2, and lever H, as and for the purpose described.

6. A whip-socket constructed as described, in combination with lever B, the upper end of which, when properly oscillated, locks the whip in the socket, rod D, arm *d*, spindle E, having a shelf projecting laterally therefrom, case *c*, in which said spindle is journaled, having a front semicircular plate of suitable width, which plate has an Γ projecting therefrom and a spring for keeping it in position, transversely-oscillating tumbler G, having spurs *h*, *h'*, and h^2, and lever H, having lug *k* projecting therefrom, substantially as and for the purpose set forth.



413,684. PAPER-BAG MACHINERY. CHARLES R. STILWELL, Philadelphia, Pa., assignor to the Union Paper Bag Machine Company, same place. Filed July 5, 1889. Serial No. 316,543. (No model.)

Claim.—1. In a paper-bag machine, the double-flanged aligning-wheels C, in combination with pivoted supports, adjusting-screws B^4, and pivoted screw-blocks B^2, substantially as and for the purpose specified.

2. In a paper-bag machine, the combination, with former-plates E E^2, of aligning-wheels D, arranged to engage the inwardly-tucked sides of a tube, double-flanged aligning-wheels C, arranged to rest against the upper edges of the tube with their flanges embracing the same, a pivoted support for the double-flanged aligning-wheels, an adjusting-screw B^4, and a pivoted support B^2 for said screw, substantially as and for the purpose specified.

413,684.

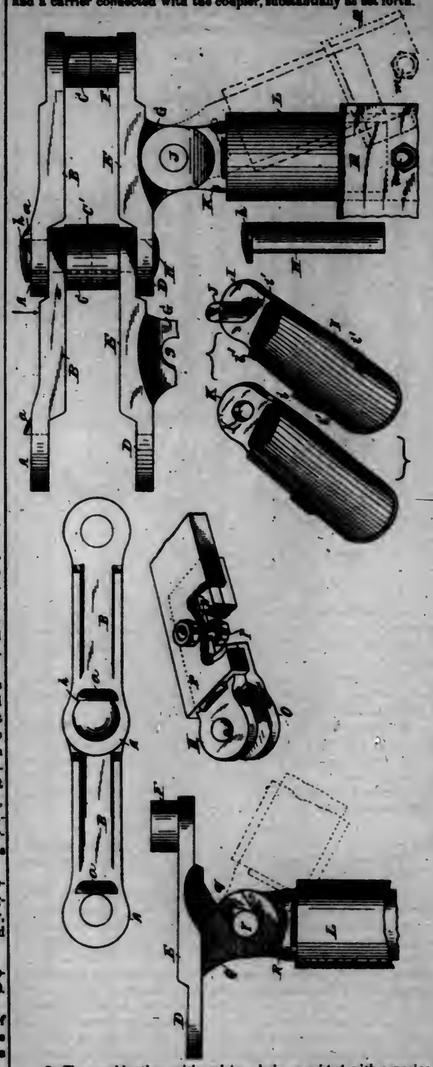
3. In a paper-bag machine, the combination, with former-plates E E^2, of aligning-wheels D, arranged to engage the inwardly-tucked sides of a tube, double-flanged aligning-wheels C, arranged to rest against the upper edges of the tube with their flanges embracing the same, a pivoted support for the double-flanged aligning-wheels, an adjusting-screw B^4, a pivoted support B^2 for said screw, a plate *c'*, having a ridge *c* to keep the pasted edge of the paper out of contact with the lower ply while the tube is being aligned by the wheels D C, and presser-rolls F F', situated in advance of the aligning-wheels, substantially as and for the purpose specified.

4. In a paper-bag machine, the combination, with former-plates E E^2, of aligning-wheels D, arranged to engage the inwardly-tucked sides of a tube, double-flanged aligning-wheels C, arranged to rest against the upper edges of the tube with their flanges embracing the same, a pivoted support for the double-flanged aligning-wheels, an adjusting-screw B^4, a pivoted support B^2 for said screw, a plate *c'*, having a ridge *c* to keep the pasted edge of the paper out of contact with the lower ply while the tube is being aligned by the wheels D C, a finger H, arranged to hold the upper lip of the tube in approximately correct position while it is passing over ridge *c*, and presser-rolls F F', situated in advance of the aligning-wheels, substantially as and for the purpose specified.

5. In a paper-bag machine, aligning-rolls D, adapted to pass between the folded sides of the tube, in combination with supporting-arms D' and arms D^3, screws D^4, securing arms D' and D^3 together, and pivots D^4, securing arms D^3 to the frame, substantially as and for the purpose specified.

413,685. CARRIER. JOHN I. TAPLIN, Circleville, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Oct. 20, 1888. Serial No. 288,689. (No model.)

Claim.—1. In a carrier, the combination of two parallel lines of chain, carrier-bars between the chains, articulating and extensible couplers connecting the carrier-bars and the chain, and carriers mounted on the bars, substantially as set forth.



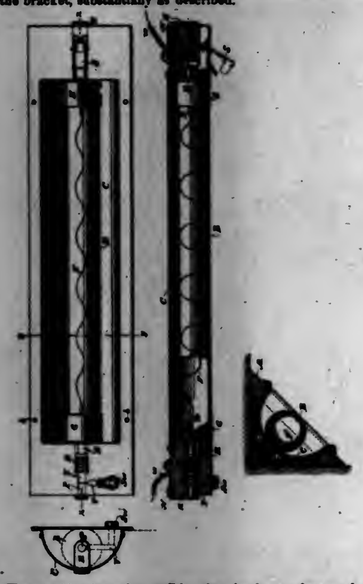
2. In a carrier, the combination of two parallel lines of chain, carrier-bars, and articulating extensible and rotatory couplers connecting the carrier-bars with the chain, substantially as set forth.

3. In a carrier, the combination of two parallel lines of chain, carrier-bars, and extensible couplers pivoted to the chains, substantially as set forth.

4. In a carrier, the combination of two parallel lines of chain, carrier-bars between the chain, and couplers pivoted at their ends to the chain and loosely connected at their opposite ends to the carrier, substantially as set forth.

5. The combination, with a drive-chain provided with a projection adapted to support a carrier, of a coupler pivoted to the projection and a carrier mounted upon and loosely connected with the coupler, substantially as set forth.

6. The combination, with a drive-chain provided with a projection adapted to support a carrier, of a two-part coupler overlapping opposite sides of the projection and connected therewith by a pivot, and a carrier connected with the coupler, substantially as set forth.



7. The combination, with a drive-chain provided with a projection adapted to support a carrier, of a coupler pivoted to the projection and a carrier provided with an opening to receive and surround the coupler, substantially as set forth.

8. The combination, with a drive-chain provided with a projection adapted to support a carrier, of a two-part coupler connected with the projection and a tubular carrier-bar mounted upon the two-part coupler, substantially as set forth.

413,686. ELECTRIC LAMP. JEAN T. VAN GEMERT, New York, N. Y., assignor to the Van Gestel Electric Street Car Company, same place. Filed Aug. 17, 1888. Serial No. 283,002. (No model.)

Claim.—1. A wall-bracket for an incandescent lamp, consisting of an oblong sustaining-frame having a depression or groove, in combination with a tubular incandescent lamp held in place in said groove, substantially as described.

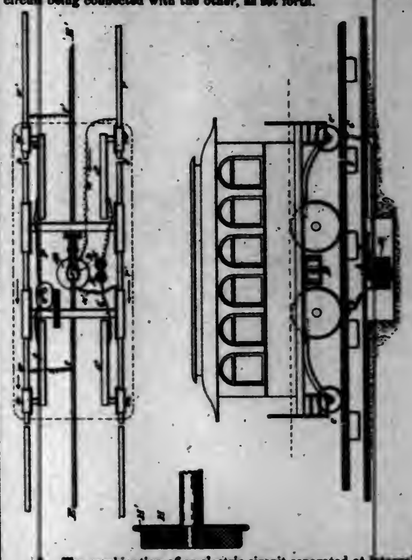
2. A wall-bracket for an incandescent lamp, consisting of an oblong support or frame having spring-contacts for making electrical contact with the poles of the lamp, the whole being located below the face of the bracket, substantially as described.

3. The combination of a wall-bracket having a depressed or grooved space for holding an incandescent lamp with spring-seated contacts and a catch for holding the lamp in place, substantially as described.

4. In an incandescent-lamp fixture, the combination of a tubular lamp located in an oblong depression with spring-seated contacts and a retaining-catch, substantially as described.

5. The combination of a tubular lamp with a grooved bracket, composing a reflector and electrical connections, as described.

6. The combination of the following elements: the grooved reflecting-brackets C, the tubular lamp B, having trunnions E E, the spring-seats H H, pin T, switch Sw, and retaining-catch S, substantially as described.

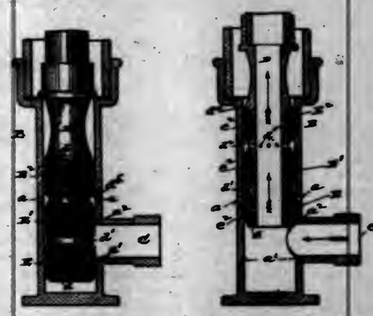


418,687. ELECTRIC-RAILWAY SYSTEM. MALONE WHEELER, Washington, D. C., assignor of one-half to Samuel R. Wheatley, same place. Filed July 22, 1889. Serial No. 318,261. (No model.)

Claim.—1. The combination of an electric circuit separated at intervals, magnets placed at the points of separation, the armatures of the magnets normally closing the circuit, a car provided with a source of electricity and a motor, and two lines of conductors consisting of sections insulated from one another, the magnets and the source of electricity on the car being connected with one line, the motor and the main circuit being connected with the other, as set forth.

2. The combination of an electric circuit separated at intervals, track-rails insulated from one another, magnets placed at the points of separation of the circuit and connected with one line of rails, the armatures of the magnets normally closing the circuit, a car carrying a source of electricity connected with the line of rails to which the magnets are connected and a motor connected with the other line of rails, the main circuit being connected with the latter line of rails on each side of each point of separation, as set forth.

3. The combination of a closed conduit with an electric circuit placed therein and separated at intervals, magnets placed at the points of separation, the armatures of the magnets normally closing the circuit, a car provided with a source of electricity and a motor, and two lines of conductors consisting of sections insulated from one another, the magnets and the source of electricity on the car being connected with one line, the motor and the main circuit being connected with the other, as set forth.

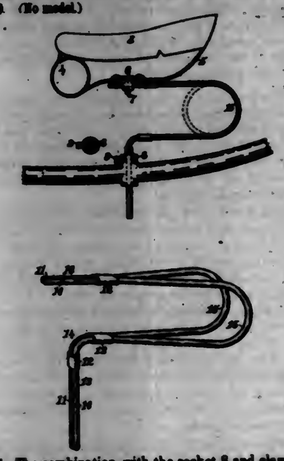


4. The combination of a closed conduit with an electric circuit consisting of an insulated main conductor separated at intervals, magnets placed at the points of separation, the armatures of the magnets normally closing the circuit, a car provided with a source of electricity and a motor, and two lines of conductors consisting of sections insulated from one another, the magnets and the source of electricity on the car being connected with one line, the motor and the main circuit being connected with the other, as set forth.

5. The combination of an electric circuit separated at intervals, magnets placed at the points of separation, the armatures of the magnets normally closing the circuit, a car provided with a source of electricity and a motor, and two lines of conductors consisting of sections insulated from one another, the magnets being connected with the sections of one line of conductors on opposite sides of the points of insulation, and the source of electricity on the car connected with the same line, the motor connected with the other line and the main circuit connected on each side of each point of separation with the sections of the latter line on opposite sides of the points of insulation, as set forth.

413,688. HYDRANT-VALVE. PETER WEITZ, St. Louis, Mo. Filed May 20, 1889. Serial No. 311,490. (No model.)

Brief.—The annular packing which admits water behind it has an internal annular groove, whereby it is rendered weaker upon a circumferential line.



Claim.—1. The combination of the valve-chamber having the inlet C and the waste-openings *a*, the shouldered tubular valve-stem, and the flexible grooved bands E E' E², substantially as described.

2. The combination of the valve-chamber having the inlet C, the shouldered tubular valve-stem, and the grooved flexible bands, substantially as described.

3. The combination, in a valve, of the valve-chamber, the valve-stem, and the flexible bands E E', said stem being shouldered, and said bands fitting loosely between the stem and chamber-shell and being grooved, substantially as described.

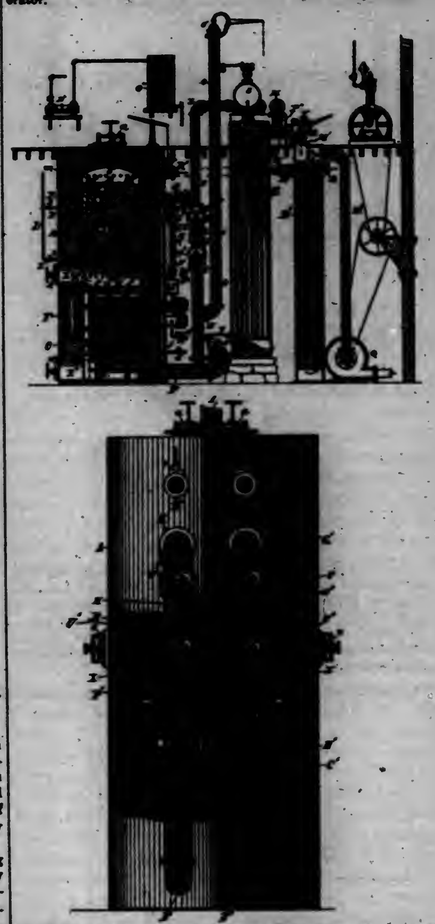
418,639. VELOCIPEDE. JOHN S. BENT, Swanzey, Mass., assignor of one-half to William P. Mason, same place. Filed Aug. 6, 1889. Serial No. 319,759. (No model.)

Claim.—1. The combination, with the socket S and clamp-screw 9, and the clamp-piece 6, having the clamp-screw 7, of the rods 10 and 11, bent at or nearly at right angle at 14, extending rearward to form the spring-loop 15, ending in the horizontal ends 16, adapted for entering the clamp-piece 6, as described.

2. The combination, with the socket S, of the adjustable saddle-support consisting of the rods 10 and 11, united by the bands 12, and bent so as to form the rearwardly-extending bifurcated spring-loop 15, the vertical end 13 and the horizontal end 16, constructed to be adjustably secured and form a yielding spring-support for the saddle of a velocipede, as described.

REISSUES.

11,086. PROCESS OF AND APPARATUS FOR THE MANUFACTURE OF GAS. DUDLEY LOOMIS, Hartford, Conn. Filed Sept. 10, 1888. Serial No. 323,562. Original No. 404,207, dated May 28, 1889.



Claim.—1. The process of manufacturing gas which consists in heating a body of fuel to incandescence by drafts of air drawn downward into the fuel and by drawing off the gaseous products by an exhauster, whereby the fuel may be better fed, inspected, and arranged in the generator during the operation of heating up, then shutting off the air-draft and decomposing steam in contact with the fuel, thereby producing water-gas.

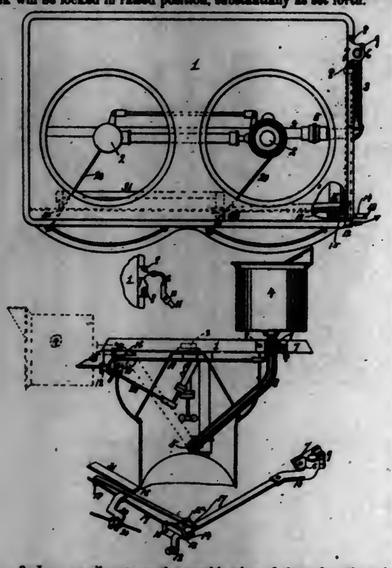
2. The process of manufacturing gas which consists in heating a body of fuel to incandescence by downward drafts of air, and by means of the resulting gaseous products heating a superheating-chamber and drawing off the products by an exhauster, whereby the furnace may be charged and cleaned during the operation of the exhauster, then shutting off the air-drafts and superheating steam by passage through the superheating-chamber and decomposing it by passage through the incandescent fuel, thereby producing water-gas.

3. The process of producing fixed combustible gas which consists in forming a bed of incandescent fuel in a generating-chamber, supplying fresh fuel at suitable intervals to the top of said bed of fuel, admitting atmospheric air to the generating-chamber above the fuel and drawing or exhausting it downward into said fuel, drawing or exhausting the oily and tarry vapors and products of combustion down into and through the incandescent fuel, and drawing or exhausting the resulting fixed gaseous products out of the generating-chamber at or near its bottom, as described.

4. In combination with a gas-generating cupola or furnace, an air-supply pipe or opening connecting with the top above the fuel, means for controlling the supply of air through such pipe or opening, and an outlet for gaseous products leading from the bottom, and an exhauster connecting with such outlet-pipe for drawing off gaseous products from the bottom of the generator, as described.

5. In combination with the gas-generating furnace, a tubular air-heater and gas-cooler having an air-inlet and pipe connecting it with the top of the generator, an exhaust-pipe for gaseous products leading from the bottom of the generator and connecting with the tubes of the heater, and a connected exhauster for drawing off the gaseous products through the tubes and drawing air through the chamber around the tubes and down into the fuel, whereby the gas is cooled by the circulating air and the latter is heated as it flows to the generator.

6. In a cupola gas-generating furnace, the fuel-chamber arranged above and the superheating and fixing chamber below, in combination with the valved take-off pipe F, leading from the superheating-chamber, outlet-pipe G, leading from the fuel-chamber, valved pipe H, connecting pipe G with pipe F, and escape-pipe O, having a closing cap or valve leading from pipe H, for the purpose described.



7. In a cupola gas-generating furnace, the two fuel-chambers and the two superheating and fixing chambers, in combination with valved pipes F F', pipes G G', connecting-pipes H H', having valves *h h'*, cross-pipe *g*, connecting the pipes H H' between the valves, and pipe J, leading from pipe *g* to the seal-box, as and for the purpose described.

11,087. GASOLINE-STOVE ATTACHMENT. CHARLES A. STOCKSTROM, St. Louis, Mo., assignor of one-half to Louis Stockstrom, same place. Filed Aug. 10, 1889. Serial No. 320,422. Original No. 360,634, dated Oct. 2, 1883.

Claim.—1. In a vapor-stove, a lay-down tank, in combination with stationary burner having a valve and valve-stem and a locking device mechanically connected with said stem and adjustable in the path of the tank-pipe to lock the tank in raised position, substantially as set forth.

2. In a vapor-stove, a supply-pipe for the burner and a lay-down

tank and pipe pivoted on the supply-pipe, in combination with a burner, a valve and valve-stem therefor, and a locking device connected with the said valve-stem and constructed to be adjusted in the path of the tank-pipe, whereby when the burner-valve is open the tank will be locked in raised position, substantially as set forth.

3. In a gasoline-stove, the combination of the valve, the valve-lever, oil-tank, swinging supply-pipe to which the tank is connected, the clamp having hinged part for holding the supply-pipe in an upright or using position, and connection between said hinged part of the clamp and the valve-lever, whereby the valve is turned and closed when the clamp is opened to lower the tank, substantially as and for the purpose set forth.

4. In a gasoline-stove, the combination of the valve, the valve-lever, oil-tank, swinging supply-pipe to which the tank is connected, the clamp for holding the supply-pipe in its upright or normal position, having lever 11, and mechanism connecting said levers, whereby the valve is turned and closed and the clamp opened by the outward movement of the clamp-lever to release the supply-pipe, substantially as and for the purpose set forth.

5. In a gasoline-stove, the combination of a valve, valve-lever, oil-tank, swinging supply-pipe to which the oil-tank is connected, the clamp for holding the supply-pipe in an upright position, lever 11, secured to said clamp, and means for operating the valve-lever connected to the clamp-lever, consisting of a bar 16, provided with the angled end 18, and the sliding bar 31, having arm 30, substantially as and for the purpose set forth.

6. In a gasoline-stove, the combination of the valve, valve-lever, swinging supply-pipe, oil-tank connected to the pipe, the clamp having fixed part 7 and moving part 6 for holding the pipe in its upright position, lever 11, secured to the moving part of the clamp, and means forming a connection between the clamp-lever and the valve-lever, substantially as and for the purpose set forth.

7. In a gasoline-stove attachment, in combination with the valve, valve-lever, swinging supply-pipe, tank secured to the pipe, means for holding the pipe in an upright position, consisting of a clamp comprising a fixed part 7, secured to the frame of the stove, and a moving part 6, pivoted to the fixed part, a lever connected to the moving part of the clamp, and a bar 16, connected to the clamp-lever having an angled end 18, and a bar 31, having an arm 30, substantially as and for the purpose set forth.

8. The combination, with a gasoline-stove having a pivoted supply-pipe provided with a tank, of the clamp secured to the stove, having a fixed part 7 and a hinged part 6, provided with an arm 10, and lever 11, substantially as described.

9. The combination, with a gasoline-stove having a pivoted supply-pipe provided with a tank, of the bracket 15, secured to the stove, formed with an arm 13, for supporting the supply-pipe when in lowered position, and a clamp having fixed part 7, moving part 6, for holding the pipe in normal position, and a lever 11, substantially as described.

10. The combination, with a gasoline-stove having a pivoted supply-pipe provided with a tank, a valve having a lever by which it is turned, a sliding bar 31, having an arm 30 engaging the valve-lever, and a rod 19, on which the bar slides, of the clamp having a lever, and a bar 16, connected with the clamp-lever, having an angled end 18, adapted to slide on the bar for engaging the arm of the bar when the clamp-lever is moved outwardly, substantially as described.

NORRIS PETERS

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

WHERRY *v.* HECK.

Decided October 14, 1889.

1. INTERFERENCE BETWEEN TWO APPLICATIONS—BURDEN OF PROOF—RULE 116.

Where one party to an interference filed his application in March, 1887, and the other in February, 1887, and the former asserted that he communicated the invention to the latter, and that he (the latter) simply embodied as a constructer and mechanic the ideas conceived by the former and described by him to the latter, and that even if the latter were an original inventor he (the former) was the first to conceive of the subject-matter in interference, and was using due diligence in reducing the invention to practice, while the latter was making the complete machine, it was *Held* that the burden of proof was upon the former to establish one of those propositions under Rule 116, and that the burden is discharged by establishing a fair preponderance of legal evidence in behalf of him upon whom the burden rests.

2. SAME—WHAT PROOF SUFFICIENT TO PROVE ORIGINALITY OF INVENTION.

Where the senior party to an interference directly and unqualifiedly contradicts the claim of the junior party that he communicated the invention to the senior party and that he employed the senior party to make a model to embody the ideas which he (the junior) communicated, the issue must be found against the junior party in spite of his own testimony to the opposite effect, unless there is other testimony in the case corroborative of his contention and sufficient to turn the scale.

3. SAME—EMPLOYER AND EMPLOYÉ.

The relation of employer and employé cannot be established where it appears that one party received no pay whatever for his services, and that it was not pretended there was any promise of payment on the part of the other or expectation of payment on the part of the former, although it appears that there were frequent interchanges of courtesies between the parties and "in this interchange of courtesies that honors were easy."

4. SAME—WHAT IS SUFFICIENT PROOF OF CONCEPTION OF INVENTION BY ORAL DISCLOSURE.

The descriptive language used should be such as to disclose the invention as a drawing would disclose it. The description, on its face, as detailed by the witness, must show not only that the applicant had a conception of the desirability of doing the thing, but also a conception of a way of doing it, and a way of doing it so definitely thought out that the listener, if skilled in the art, could produce the invention from the description, at least in a rude form of embodiment.

5. SAME—PROPERTY IN PATENTS.

Property in patents ought not to be created as against a rival applicant first to reduce to practice and first in the Office upon mere verbal testimony indefinite in its character unaided by the production of memoranda, drawings, or models under circumstances which in themselves tend to indicate its intrinsic improbability.

APPEAL from Examiners-in-Chief.

FARE-BOXES.

Application of John R. Wherry filed March 2, 1887, No. 229,407. Application of Louis F. Heck filed February 5, 1887, No. 226,626.

Messrs. Knight Brothers for Wherry.
Mr. Henry A. Seymour for Heck.

MITCHELL, *Commissioner:*

The issue in controversy is defined as follows:

The combination, with a case having a fare-inlet, of a removable fare-receptacle, and locking mechanism adapted to close both the fare-inlet and the removable fare-receptacle by the removal of the latter from the case.

It is alleged in the preliminary statement of Heck that he made drawings of the invention in interference and explained them to others about October 11, 1886; that he began a model showing the invention on or about October 16, 1886, and that he embodied it in a full-sized machine, which was completed on or about January 22, 1887. The proofs offered on the part of Heck in support of the allegations of his preliminary statement establish the fact that as early as October 11, 1886, a drawing like the drawing known in the case as "Exhibit A" was produced by Heck and was at that time seen by his wife and a Miss Frances Schales; that this drawing, or one similar to it, was exhibited in September or October to a Mr. Schmuck; that for some time Heck worked upon a rough model intended to illustrate the features shown in "Exhibit A," but that he discarded some of the special features shown in that exhibit and produced a model showing the device constructed as described in his application, and showed it in an incomplete condition to Mr. Schmuck in December, 1886; that he completed this model on the 22d day of January, 1887, and that the device embodying the ideas described in the patent was begun on or about October 16, 1886, and finished in January, 1887, as already stated, and constituted in all respects a complete working machine.

Wherry's case, as against Heck, depends upon the sufficiency of his proof in support of one or both of two propositions: *First*, that he communicated the invention to Heck, who simply embodied as a constructor and mechanic the ideas conceived by Wherry and described by him to Heck, and, *second*, that even if Heck were an original inventor Wherry was the first to conceive of the subject-matter in interference and was using due diligence in reducing his conception to practice while Heck was making the complete machine.

The burden of proof is upon Wherry to establish one of these propositions. Rule 116 provides that the parties shall be presumed to have made the invention in the chronological order in which they filed their completed applications, and that the burden of proof will rest upon the party who shall seek to establish a different state of facts. While this is the case, however, the rule which governs the amount or weight

of evidence required to discharge the burden is very different from that which is required in order to overcome the presumption arising out of the actual granting of a previous patent. In the latter case, as has been repeatedly held, the proof should be sufficient to warrant setting aside a patent, if the Office had appropriate jurisdiction for that purpose, while in a case like the one under consideration the burden is discharged by establishing a fair preponderance of legal evidence in behalf of him upon whom the burden rests.

The first question, then, is, has Wherry succeeded in showing by a fair preponderance of lawful evidence that the invention wrought out by Heck was communicated to him by Wherry? It is agreed that the machine as produced by Heck departed in important particulars from the conception which Wherry claims to have communicated; but what Wherry insists upon is that he told Heck how to embody the subject-matter in interference in the form shown or suggested by "Exhibit A," and that therefore he is to be regarded as having communicated the broad conception of the invention which constitutes the subject-matter in controversy. There is no doubt that about the 1st of October, 1886, a conference did take place between Wherry and Heck with reference to improving the fare-box previously patented to Wherry; but Heck testifies that it was simply with reference to improving upon the previous fare-box without any definite suggestions whatever as to the nature of the improvement to be made and without any expectation whatever that he was to become an employé of Wherry.

With reference to the issue in controversy Heck testifies in reply to questions as follows:

Q. 14. Now, with regard to this invention, in what particular did John R. Wherry refer you to an improvement, and in what respect did he suggest an improvement thereon? A. In regard to the key in the case he suggested no idea.

Q. 15. Did he suggest to you at that time or subsequently the issue in controversy? A. He suggested no idea to me in regard to that.

Q. 16. After, as you have stated in your answer above, that you saw that you could not make an improvement upon the key, and after your conversation with Wherry, what did you do then? State all the facts. A. I made up my mind to study on some different way, as I said that I could not make any improvement upon the box of Mr. Wherry; I put my mind to work to construct some kind of a combination by which the same object could be reached in a different way.

Although Wherry claims that he employed Heck to make a model to embody the ideas which he communicated, Heck in the most explicit manner contradicts this statement.

The following also is a portion of Heck's testimony:

Q. 46. Did Wherry, at any time, suggest to you any ideas, either original or of change or alteration to your idea, as conceived and embodied in the drawings last above referred to? A. No, sir.

Q. 47. Then I understand you to say that the idea involved in the drawings last above referred to and embodied in your application for a patent are your own original ideas and invention? A. They are.

Q. 48. Did Wherry ever employ you, in any manner, shape, or form, to work for him in regard to the idea in issue? A. No, sir.

Q. 49. Did he ever pay you anything of any kind or character for work done in the matter above referred to? A. No, sir.

Q. 50. Did he ever give you any instructions, or tell you in what manner to work, in regard to the idea in issue? A. No, sir.

Q. 51. Has Wherry had any part, parcel, or participation in the invention upon which you have applied for a patent? A. No, sir.

Q. 52. Is, or is not, that your sole original invention for which you have applied for a patent, or not? A. It is.

Q. 53. Mr. Wherry says "that when he first talked to you about his invention he employed you, he explained to you the issue in controversy, and requested you to work upon the invention under his instructions." I ask you if that is true? A. No, sir.

Q. 54. He says, in answer to question No. 53 in his deposition, "that you were an employé of his to make the model." Is that true? A. No, sir.

Q. 55. He says "that you made the model, but did not deliver it to him." How about this? A. I made no model for him, and consequently had none to deliver to him.

Q. 56. Mr. Wherry says "that he also furnished you with some rough sketches and a model from which to work." Is that true? A. No, sir.

Thus Heck, without evasion, but directly and unqualifiedly, contradicts the claim of Wherry in this regard, and it is therefore quite clear that the burden of proof being upon Wherry, the issue must be found against him, in spite of his own testimony to the opposite effect, unless there is other testimony in the case corroborative of Wherry's contention and sufficient to turn the scale. This view seems to be entertained by counsel for Wherry, who say that the conflict of evidence between Heck and Wherry is direct, and that therefore it is necessary to look beyond the statements of the parties to the surrounding facts to determine which of the contradictory assertions is probably correct.

The testimony of Mrs. Wherry would be of no importance in determining the question, even if it were held admissible. Although she testifies to the conversation between Wherry and Heck, about which there is no dispute, and which took place about the 1st of October, 1886, she expressly states that she did not hear enough of the conversation to tell what it was, and that she cannot state what the interference is or what the subject-matter is in dispute. No other witness pretends to say what was said between Heck and Wherry.

But it is claimed that it is proven that Wherry had the conception prior to the conversation with Heck, and that the presumption is that he communicated it during this conversation, and that out of such communication the efforts of Heck originated. The theory presented is that Heck was employed as a competent workman by Wherry to embody in a working form the invention which Wherry had previously made and communicated by description to other persons. But the evidence wholly fails to prove that Heck stood in the relation of an employé to Wherry. He received no pay whatever for his services, nor is it pretended that there was any promise of payment on the part of Wherry or expectation of payment on the part of Heck. Wherry, however, claims that there were frequent interchanges of courtesies between himself and Heck, and "in this interchange of courtesies that honors were easy." The relation of employer and employé cannot be established by such proof as this with sufficient certainty to authorize the inference based upon such relationship that there was a communication to the employé of the ideas of the so-called employer. Nevertheless, it is insisted that Wherry had the idea of the subject-matter in interference, and that, inasmuch as he had it, the presumption is that he communicated it, and that this presumption is sufficient to discharge the obligation resting upon him to meet the requirements imposed by assuming the burden of proof.

This brings us to inquiry second: Is it satisfactorily shown that the subject-matter in interference was conceived of by Wherry about the 1st of March, 1885? The recognized evidence of conception consists of proof of a model or a drawing, or a written or verbal disclosure. It is agreed in the case that Wherry explained the idea involved in the issue to Charles Pickles, of St. Louis, Mo., in January, 1887; that from such description Pickles made drawings, which drawings were completed on the 22d day of January, 1887; but this date is too late to be of any assistance to Wherry. No model or drawing is produced which was made prior to that time, nor any written description whatever. Wherry's whole case seems to depend upon an alleged oral disclosure of the invention to one Rottaken about March 4, 1885, and to a Mr. Crawford, in August, 1885.

In the nature of the case this kind of testimony is ordinarily entitled to but little weight. A drawing which is perpetuated, and which discloses with sufficient certainty the invention, leaves nothing to verbal testimony, excepting the establishment of the date when it was made; hence, like a model, it is rightly looked upon as affording such evidence of the existence of the conception at the time when it is shown to have been made as will lay the foundation of a claim to priority. (*Loom Co.* v. *Higgins*, 105 U. S., 580.) On the other hand, nothing is easier than for a mind friendly to an inventor to so combine the processes of memory and imagination as to really believe that a former conversation, which related to the general subject out of which an invention ultimately grew, contained a definite description of the invention itself.

In my opinion, no inventor whose rights stand upon drawings or models, which speak for themselves in the case, and who is first in the Patent Office with his application, should have his title to a patent overborne by the claims of a rival applicant who bases his title wholly upon mere verbal disclosures, unless the testimony setting forth those verbal disclosures is so clear and explicit that the trier himself shall be able to gather from the language employed in the description that the invention was present in the mind of the person describing it. The descriptive language used should be such as to disclose the invention as a drawing would disclose it. It is not enough for the witness to say "on such a day the applicant described his invention to me," nor is it enough if the proofs simply show that the applicant had a conception of the desirability of doing the thing which was ultimately accomplished. The description, on its face, as detailed by the witness, must show not only that the applicant had a conception of the desirability of doing the thing, but also a conception of a way of doing it and a way of doing it so definitely thought out that the listener, if skilled in the art, could produce the invention from the description, at least in a rude form of embodiment. It is the trier who is to determine whether the disclosure revealed the mental conception of the invention, and unless the evidence is sufficient to satisfy the trier that the disclosure was adapted to produce upon the mind of the listener an effect similar to the inspection of a drawing or a model he would be unwarranted in finding that such disclosure indicated the presence of the invention in the mind of the applicant. Thus in the present case Wherry testifies that he had a conception of the issue in interference about March 1, 1885, and that about the same date he explained it to Mr. Rottaken. To hold that this is evidence of a disclosure to Rottaken is simply to make Wherry the judge in his own case in the place of the tribunal having jurisdiction. So, too, Rottaken testifies that Wherry explained the issue to him a number of times, and that he mentioned it first about March 1, 1885; but no attempt is made by him to state the language employed in giving the description and no means whatever are afforded to enable the trier to determine whether the conclusion of the witness, that the description did disclose the issue in interference, is a correct one or not.

Mr. Crawford does, indeed, undertake to say what it was that Wherry explained to him. He says:

A device by which, in inserting the sack, the valve would cause to be opened, and by withdrawing the same it would again be closed or locked.

In reply to the question whether this mechanism did or did not close both the fare-inlet and the bag or money-receptacle on the withdrawal of the latter he answers:

Yes; that is the manner in which he explained it to me—that it would accomplish that.

Again, he says Wherry explained to him—

a device by which, on inserting the sack, it would unlock the valves, and by the withdrawal of the same it would cause both sack and box to be locked.

Both these alleged descriptions indicate disclosure of the result to be accomplished, but they throw no light whatever upon the mechanism by which it was to be accomplished. There is nothing here to enable the trier to say what the device was or whether it was a practical device at all, or whether, in fact, it would accomplish the result which Mr. Crawford speaks of in his answer to question 10, already quoted. I know of no law by which such testimony can be received, in a case involving a complicated structure, as evidence of the existence in a mental form of the invention in controversy. I think it has accorded to it all the weight to which it is entitled if it is treated as indicating that the applicant had a conception of the desirability of doing the thing spoken of by the witness, without any definitely-outlined conception of a mechanical combination of parts which would accomplish the result.

The views here presented are not novel, but have often found expression in the decisions of courts and of Commissioners.

Judge Lowell, in the case of *Woodman* v. *Stimpson*, (3 Fish., 98,) in speaking of the time of conception of an invention, says:

It means not only when he [the inventor] conceived that such a thing would be a desirable thing to do, but when he [the inventor] had conceived the idea of how to do it substantially as he has done it. (P. 103.)

To the same effect is the statement of Commissioner Butterworth in the case of *Voelker* v. *Gray* v. *Edison* v. *Bell*, (C. D., 1885, at page 19,) where he says:

There is not unfrequently a disposition on the part of an applicant to confound a strong desire in the mind to produce certain results by some means of which he has but a vague and indefinite conception with an intelligent conception of a machine adapted to accomplish those results. It is in such cases that the desire coupled with the imperfect conception of a device ripens and matures in the light of subsequent knowledge. That of which the law takes notice is not the maturing, but the matured conception, which can materialise in an operative device.

In *Davidson* v. *Lewis*, (1 MacA. Pat. Cases, 599, 601, 1858,) the question involved being which one of the parties was the first and original inventor, the court said:

It must be borne in mind that it is not so much he who made and perfected the first machine or instrument as he who may appear from the evidence to have been the first who conceived the idea, and so described it by words or drawings as to have been sufficient to enable a skilful workman to bring it into useful practical operation, for such a person shall be said to have made the first claim, and will be protected against the claim of any subsequent inventor who may have been first in adapting a ma-

chine or instrument to the invention, provided such first discoverer has been using due diligence in effecting the same end, and that, although he may have been unsuccessful in some of his experiments, if by following them up he at length succeeds. Such being the well-established rule of patent law, I will proceed to consider the evidence.

In *Philadelphia & Trenton R. R. Co.* v. *Stimpson* (14 Peters, 448, 1840) it is clearly intimated that the verbal disclosure must be a detailed description of the invention. One of the questions in this case was as to the admissibility of evidence of certain parties as to certain declarations and statements of the plaintiff relating to his invention prior to the date of his patent, in reply to the evidence of the defendants showing use by other persons of the same contrivance. The court in admitting the testimony said (at p. 462):

The invention itself is an intellectual process or operation, and, like all other expressions of thought, can in many cases scarcely be made known except by speech. The invention may be consummated and perfect, and may be susceptible of complete description in words a month or even years before it can be embodied in any visible form. * * *

His [the patentee's] conversations and declarations stating that he had made an invention and describing its details and explaining its operation are properly to be deemed an assertion of his right at that time as an inventor, to the extent of the facts and details which he then makes known.

In *Stephens et al.* v. *Salisbury* (1 MacA. Pat. Cases, 379, 1855) the court said:

The proof of the invention and time, it is true, consisted of the appellee's own verbal declaration; but it was made to several of the witnesses, accompanied with the effort and desire that permission should be given and an opportunity afforded him of having the same tried on railroad-cars over which they were supposed to have control, and to persons who thought the description full and clear enough to enable them to make the application, which was actually done in the year 1853. (P. 386.)

Such being the law as to the character of the disclosure and the nature of the proof of it, it follows that no sufficient evidence of mental invention is made on behalf of Wherry prior to October 11, 1886, when Heck showed "Exhibit A" to Wherry.

It is to be remembered that Wherry and Rottaken were mutually interested in the manufacture of fare-boxes, and that they were mutually interested in certain inventions relating to fare-boxes, for which patents have been granted. One of these patents was applied for January 12, 1886, more than nine months after Wherry claims to have conceived the invention in controversy, while the other one was applied for October 28, 1886, more than eighteen months after the date of such alleged conception. It is admitted and unquestionable that the combination covered by the issue in controversy is for an improvement on the fare-boxes covered by these two patents, and it is almost inconceivable that it should not have been included in one of these patents or in a contemporaneously-pending application if it had been conceived of and talked over between Wherry and Rottaken as a definitely invented and feasible machine.

I look upon the actions of Wherry, concurred in by Rottaken, in applying for patents upon fare-boxes which omitted all reference to the invention in interference, one of them nine months after the alleged disclosure of this conception and the other eighteen months afterward, as having a bearing of some importance upon the controversy and as confirming my conclusion that it would be an unwarrantable thing for me to infer that Wherry had a definite conception of the issue in interference as early as March 1, 1885, in the absence of any drawing or model or written description or verbal disclosure in detail upon which to base such inference.

In my opinion, property in patents ought not to be created, as against a rival applicant first to reduce to practice and first in the Office, upon mere verbal testimony, indefinite in its character, unaided by the production of memoranda, drawings, or models under circumstances which in themselves tend to indicate its intrinsic improbability.

Priority of invention is awarded to Heck, and the decision appealed from is therefore reversed.

EX PARTE FOWLER AND FOWLER.

Decided October 14, 1889.

1. PETITION TO INSPECT THE ABANDONED CASES IN THE PATENT OFFICE—RULE 179.

Where petitioners requested that an order be issued permitting them to inspect the abandoned cases in the Patent Office in order to protect their client from unnecessary expense and suit for alleged infringement of certain Letters Patent, &c., *Held* that the petition must be denied, although if the petitioners shall make request for certified copies of one or more abandoned applications, accompanied by a reasonable suggestion of their necessity for purposes of evidence, the request will be granted under authority conferred upon the Commissioner by Rule 179.

2. SAME.

The case of *The United States ex rel. Anthony Pollok* v. *Hall, Commissioner of Patents*, (48 O. G., 1263,) distinguished from the case at bar. The question before the court in the case cited was whether a copy of a certain specified abandoned application which had been asked for should be furnished by the Commissioner, and it is believed that the court did not intend to decide or to lay down a doctrine which would involve the logical necessity of deciding that a petition like the present should be granted.

3. DISTINCTION BETWEEN CONSTRUCTIVE ABANDONMENT OF AN APPLICATION AND CONSTRUCTIVE ABANDONMENT OF AN INVENTION.

A broad distinction is to be recognised between constructive abandonment of an application and constructive abandonment of an invention. The former may exist, and frequently does exist, without involving the latter.

4. INVENTIONS REPRESENTED IN THE ABANDONED APPLICATIONS OF THE PATENT OFFICE NOT CONCEDED TO BE THE PROPERTY OF THE PUBLIC—REVISED STATUTES, SECTION 4894.

It is not to be conceded that the inventions represented in the abandoned applications of the Patent Office are the property of the public. Until the invention has been two years in public use or on sale the inventor has lost no part of his inchoate property in his invention, either through failure to complete his application or to prosecute his completed application within the period of two years prescribed by the Revised Statutes, section 4894.

IN THE matter of the petition of Messrs. Fowler and Fowler to inspect abandoned applications.

MITCHELL, *Commissioner:*

This petition sets forth that the petitioners are doing business as attorneys at law in patent cases; that the Hydraulic Brick Machine Company, of St. Louis, Mo., has been threatened with suit for alleged infringement of Letters Patent No. 379,429, of March 13, 1888, for improvements in building blocks or bricks; that said company has instructed them to obtain all possible information relative to the rights of the aforesaid parties in the matter; that petitioners are desirous of protecting their client from said suit, and have reason to believe and do believe that the subject-matter of the aforesaid patent was old and well known at the time the application therefor was filed; that the owners of said patent have attempted to broaden the terms of their claim by construing it so as to include bricks manufactured by the company aforesaid, which are substantially different from the building-block covered by the said Letters Patent; that petitioners have reason to believe and do believe that an application for a patent was filed in the United States Patent Office and abandoned for the same kind of a building block or brick manufactured by the said Hydraulic Building Brick Machine Company, and that they are fully satisfied in their own minds that the owners of the patent aforesaid have no rights whatever in the matter as alleged by them.

The prayer of the petition is in the following language:

Your petitioners therefore respectfully request that an order be issued permitting them to inspect the abandoned cases in the United States Patent Office in order to protect their aforesaid client from unnecessary expense and suit to the great injury of its business, and in order that substantial justice may be done to all parties and all facts adduced which may be just and proper to this end.

The petitioners aver that they base their request upon the recent decision in the case of *The United States ex rel. Anthony Pollok* v. *Hall, Commissioner of Patents*, (48 O. G., 1263,) and they contend that—

by this decision the petitioners have full right to inspect the abandoned applications of the United States Patent Office, as prayed for in their petition.

They aver that while it is true that in the case before the court a copy of a certain specified application was asked for, and that the decision of the court, to some extent, was confined to the case as it was before it, nevertheless the decision is much broader and is emphatic, and clearly defines the policy of the court.

The petitioners are quite right that in the case cited the question before the court was whether a copy of a certain specified application which had been asked for should be furnished by the Commissioner. I think they are wrong, however, in believing that the court intended either to decide or to lay down a doctrine which would involve the logical necessity of deciding that the present petition should be granted. On the contrary, the language of the court seems clearly to imply, first, that a request shall be made for a specific abandoned application, and, second, that the request shall be made under "reasonable conditions." The court, referring to the objection of the Commissioner that he does not see how the matter is to become evidence, says:

Now, the court is of opinion that he is not placed in his position for any such purpose, and that it is sufficient that a reasonable suggestion of necessity for the use of a document for evidence be made, in order to set in motion his duty to furnish the copy. He is not there to sit as a judge in the controverted cause. If the suggestion be made by a reasonable person and under reasonable conditions, that suggestion should be conclusive upon him so far as the efficacy of the paper for the purposes of evidence is to be an element in the application for a copy for the purposes of evidence under the clause of the statute which has been read.

Again the court says, referring to section 4894 of the statute:

The statute expressly says that after it [the application] has lain in the Office the period provided by law—viz., two years—as an unperfected application, it shall be considered as abandoned, unless there be good cause of delay shown, which is not in this case.

But the right of an applicant to have his case reinstated upon good cause shown is involved in the question now before the Commissioner. The experience of the Office renders it morally certain that some of the applications which I am requested to subject to the examination of the petitioners have become abandoned for reasons clearly unavoidable within the statute, and it is equally certain that as to some at least of such applications petitions will be filed in due season for their reinstatement. When they are reinstated, their position in the Office will be precisely the same as if the two years' limitation had not run against them. That such applications will be entitled to an examination conducted in secrecy will undoubtedly be conceded, and it is equally clear that if meanwhile they shall have been subjected to public inspection it will not have been through the fault of the applicants.

Again, it is the experience of the Office that new applications are filed for inventions covered by previous applications that have lapsed by failure to prosecute for two years. In such cases the inventor is entitled to a patent, unless the invention has been in public use for more than two years prior to the later application. (*Lindsay* v. *Stein*, 10 Fed. Rep., 907.)

A broad distinction is to be recognized between constructive abandonment of an application and constructive abandonment of an invention. The former may exist, and frequently does exist, without involving the latter. Of the former Walker speaks as follows, (Walker on Patents, sec. 146):

Constructive abandonment of an application occurs whenever two years intervene between the filing of an application and its being made complete enough to entitle it to examination, according to the rules of the Patent Office; and such an abandonment also occurs if the applicant allows two years to pass without regularly prosecuting his application after any particular action is taken thereon by the Patent Office, and notified to him, provided, in either case, the Commissioner of Patents is not convinced that the delay was unavoidable. If he is so convinced, he may condone the delay by granting a patent, and if he grants a patent his decision on the point is conclusive.

The author, however, in the next section considers when constructive abandonment of the invention will be worked through the constructive abandonment of an application, or, rather, when a second application will not avail to obtain a patent:

Section 147. Constructive abandonment of an application will work constructive abandonment of the invention covered thereby where the abandonment of the application arose from either of the causes stated in the first paragraph of the last preceding section, if no new application is filed soon enough to independently avoid the statute relevant to public use or sale more than two years before application for a patent. * * *

But in every case where a new application is made within two years after the invention was first in public use or on sale a patent, if granted on that new application, will not be unfavorably affected by the fact that a former application was made and was constructively abandoned.

It is not to be conceded, therefore, that the inventions represented in the abandoned applications of the Patent Office are the property of the public. Until the invention has been two years in public use or on sale the inventor has lost no part of his inchoate property in his invention, either through failure to complete his application or to prosecute his completed application within the period of two years prescribed by section 4894 of the statute. His invention is still his own; the public has no right to it whatever, and he may either file a new application or satisfy the Commissioner, if he can, that the abandonment of his first application was unavoidable, and in either case his patent when obtained is just as valid as if it had been obtained upon his original application.

It follows that to grant the present petition would be to uncover to the scrutiny of the public many inventions which are still the property of the applicants, and which will ultimately mature into patents protecting such property. I am unable to see why, with reference to them, the applicants are not entitled to the same condition of secrecy which attaches to ap-

plications at other stages of prosecution and examination, and I am especially unable to understand how, after a judgment by the Commissioner that the delay to prosecute was unavoidable, any sufficient reason can be given for a course of conduct which could only be justified if the applicant were held responsible for his delay.

There are other considerations which it seems to me ought to be of weight in determining whether the policy of the Patent Office should be reversed and strangers to the inventors be permitted "to inspect the abandoned cases in the United States Patent Office." Among them is the danger of the fraudulent appropriation of the inventions of others; but as in this case I have no doubt the petition is made in good faith, I do not deem it necessary to dwell upon that consideration.

It is unnecessary for me to add that if the petitioners shall make request for certified copies of one or more abandoned applications, accompanied by a reasonable suggestion of their necessity for purposes of evidence, the request will be granted under authority conferred upon the Commissioner by Rule 179; but inasmuch as I do not understand the court to have intended in the case cited to say or imply that such a request as the one under consideration ought to be granted, I must deny the petition.

EX PARTE EVERITT.

Decided September 30, 1889.

WHAT IS SUFFICIENT CROSS-REFERENCE UNDER RULE 43.

A cross-reference which refers by serial numbers only to applications which may never mature into patents is not sufficient and not in compliance with Rule 43. Cross-references must be of such nature that they will impart a more or less definite conception of their scope. It cannot be assumed that all applications will mature into patents, nor can it be permissible that they shall refer for purposes of construction or interpretation to instruments to which the public has no access.

ON PETITION.

AUTOMATIC DATING OR STAMPING AND DELIVERY OF TICKETS.

Application of Percival Everitt, No. 222,632, filed December 27, 1886.

Messrs. J. J. Halsted & Son for the applicant.

MITCHELL, *Commissioner:*

In this case the examiner required that reference be made in the specification to certain other pending applications of the applicant. This requirement was sustained by Commissioner Hall, who on the 8th of March, 1889, denied a petition asking relief from the examiner's requirement. Thereafter applicant filed an amendment in the following language:

I do not herein claim anything claimed in my applications having the serial numbers 226,420 and 278,504, respectively.

The examiner held that this cross-reference did not constitute a compliance with Rule 43. Thereupon a further petition was taken to the Commissioner.

Whether or not cross-references should be required has already been decided by the former Commissioner. Whether the cross-reference filed is sufficient is the only question which remains to be considered. A moment's reflection will show that the cross-reference now under consideration is not sufficient, since it refers to applications which may never mature into patents. In order that the meaning and scope of cross-references may be ascertained when they are required at all, they must be of such nature that they will impart a more or less definite conception of their scope. It certainly cannot be assumed that all applications will mature into patents, nor can it be permissible that they shall refer for purposes of construction or interpretation to instruments to which the public has no access.

The petition is denied.

(ORDER NO. 583.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., September 24, 1889.

Beginning with the first number of the OFFICIAL GAZETTE published in November, which will bear date November 5, 1889, the condition of business in the various Examining Divisions of this Office will be published each week.

(Signed) C. E. MITCHELL,
Commissioner.

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1887, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 820 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Vol. 7. Appendix No. 7, July 1, 1887, to June 30, 1888. One volume, 68 pages. In paper covers, $1.50.

Women Inventors.

The Patent Office has published and has for sale a volume, containing a list of women inventors to whom patents have been granted by the United States from 1790 to July 1, 1888. 44 pages. Paper covers, 50 cts.

Issue of October 29, 1889.

Patents	538	No. 413,640 to No. 414,177, inclusive.

DESIGNS.

19,376 to 19,378, inclusive.—BRACELET.—*Edward P. Beach*, Newark, N. J. Applications filed September 25, 1889. Serial Nos. 325,078 to 325,080, inclusive. Term of patents 3½ years.

19,379.—RULE.—*Frederick Benzinger*, New York, N. Y., and *Hans Edgar Grabau*, Hoboken, N. J. Application filed September 26, 1889. Serial No. 325,219. Term of patent 7 years.

19,380.—FONT OF PRINTING-TYPE.—*William F. Capitain*, Chicago, Ill., assignor to *Marder, Luse & Co.*, same place. Application filed October 5, 1889. Serial No. 326,129. Term of patent 7 years.

19,381.—HOSE-WAGON BODY.—*Harlan P. Colby*, Grand Rapids, Mich. Application filed September 9, 1889. Serial No. 323,456. Term of patent 7 years.

19,382 to 19,390, inclusive.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Applications filed October 1, 1889. Serial Nos. 325,719 to 325,727, inclusive. Term of patents 3½ years.

19,391.—RUG.—*Julius Pegel*, Philadelphia, Pa., assignor to *John Bromley & Sons*, same place. Application filed October 7, 1889. Serial No. 326,286. Term of patent 3½ years.

19,392.—RUG.—*Adolph Petzold*, Philadelphia, Pa., assignor to *John Bromley & Sons*, same place. Application filed October 7, 1889. Serial No. 326,282. Term of patent 3½ years.

19,393.—RUG.—*Adolph Petzold*, Philadelphia, Pa., assignor to *John Bromley & Sons*, same place. Application filed August 19, 1889. Serial No. 321,179. Term of patent 3½ years.

19,394.—COOKING-STOVE.—*Charles F. Walther*, Buffalo, N. Y., assignor to *Sherman S. Jewett & Co.*, same place. Application filed October 3, 1889. Serial No. 325,926. Term of patent 14 years.

19,395.—LAMP OR GAS SHADE.—*Joseph Webb*, Beaver, Pa. Application filed September 28, 1889. Serial No. 325,450. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

17,143.—BELTS FOR MACHINERY AND HOSE FOR CONDUCTING WATER. *Boston Woven Hose Company*, Boston, Mass. Application filed August 26, 1889. Used since August 1, 1889.
"The words 'BOSTON EXTRA.'"

17,144.—CHAMPAGNE-WINE.—*Chs. Arnould & Heidelberger*, Rheims, France. Application filed August 8, 1888. Used since 1856.
"A shield of arms and the words 'DE ST. MARCEAUX & Co.'"

17,145.—CHAMPAGNE-WINE.—*Chs. Arnould & Heidelberger*, Rheims, France. Application filed August 8, 1888. Used since May 27, 1882.
"The words 'ST. MARCEAUX SEC.'"

17,146.—CHEWING-GUM.—*Charles T. Heisel*, Cleveland, Ohio. Application filed August 28, 1889. Used since August 19, 1889.
"The word 'MALTO.'"

17,147.—FERTILIZERS.—*Lister's Agricultural Chemical Works*. Newark, N. J., Baltimore, Md., and Rochester, Utica, and New York, N. Y. Application filed September 11, 1889. Used since August 1, 1889.
"The words 'HOME STRETCH, SWIFT & SURE' and the representation of a race-horse and his rider."

17,148.—MEDICINE FOR THROAT TROUBLES AND FOR COLDS, COUGHS, CHILLS, &c.—*Frank Mellersh*, New York, N. Y. Application filed September 3, 1889. Used since July, 1887.
"The words 'BRONCHIA-LYNE TONICON.'"

17,149.—BLACK-LEAD.—*William George Nizey*, London, England. Application filed May 29, 1889. Used since December 1, 1847.
"The word 'NIZEY.'"

17,150.—TOILET SOAP.—*Joseph Simon*, Paris, France. Application filed June 11, 1888. Used since 1876.
"The words 'CRÈME SIMON.'"

17,151.—RICE-POWDER FOR TOILET USE.—*Joseph Simon*, Paris, France. Application filed June 11, 1888. Used since 1876.
"The words 'POUDRE SIMON.'"

17,152.—COAL-OIL LAMPS, LANTERNS, AND LAMP-CHIMNEYS.—*Standard Lighting Company*, Cleveland, Ohio. Application filed July 19, 1889. Used since May 1, 1885.
"The words 'GLOBE INCANDESCENT.'"

17,153.—LINIMENT FOR EXTERNAL APPLICATION.—*George P. H. Taylor*, Stillwater, N. Y. Application filed September 9, 1889. Used since August, 1889.
"The word 'HAKKALINE.'"

17,154.—KITCHEN AND HOUSEHOLD ARTICLES OF SHEET-STEEL.—*The Bronson Supply Company*, Cleveland, Ohio. Application filed July 12, 1889. Used since January 1, 1889.
"The words 'NEVER BREAK.'"

17,155.—CINCHONA-CORDIAL, BLOOD-SPECIFIC, LIVER-PILLS, AND OINTMENT.—*Herbert B. Ewbank*, Atlanta, Ga. Application filed March 30, 1889. Used since March, 1884.
"The word 'TOPAZ.'"

17,156.—WEARING-PLATES FOR BOOTS AND SHOES.—*The Hartford Heel Plate Company*, Hartford, Conn. Application filed September 14, 1887. Used since July, 1887.
"The letter 'K.'"

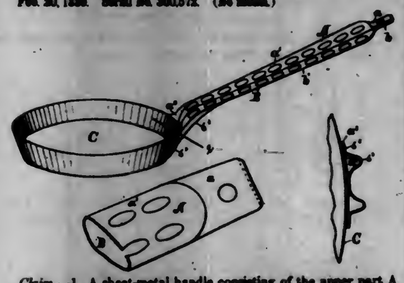
17,157.—FLY-PAPER.—*Jacob A. Mattler*, Kenton, Ohio. Application filed August 24, 1889. Used since August, 1889.
"The word 'BUCKEYE.'"

17,158.—PAINTS AND COLORS.—*J. B. Orr & Co.*, (*Limited*,) Charlton, county of Kent, and London, England. Application filed August 12, 1889. Used since August 14, 1889.
"The representation of two oars crossed placed over the letter 'O,' inclosing the letters 'S P C,' and the words 'CHARLTON WHITE.'"

17,159.—LINIMENT, BLOOD-PURIFIER, AND CHILL-TONIC.—*X I X Medicine Co.*, Gatesville, Tex. Application filed July 5, 1889. Used since November 15, 1886.
"The representation of an eye and letters 'X' arranged in connection therewith to phonetically read 'X I X.'"

LABELS.

6,045.—Title: "HOG CHOLERA REMEDY."—*Robert Blackburn* and *Claude Weeds Blackburn*, Chicago, Ill. Application filed October 5, 1889.

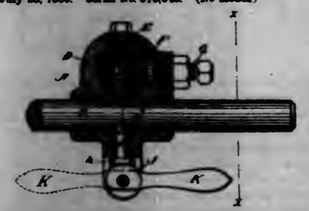


6,046.—Title: "VON LAER'S SPARKLING ACID PHOSPHATE CARBONATED."—*James P. W. von Laer*, Boston, Mass. Application filed October 4, 1889.

6,047.—Title: "MELTED ROCK CANDY." (For a sirup.)—*Albert H. Stillwell*, Philadelphia, Pa. Application filed September 30, 1889.

PATENTS

GRANTED OCTOBER 29, 1889.



413,640. SHEET-METAL HANDLE. HENRY W. AVERY, Cleveland, Ohio, assignor to the Avery Stamping Company, same place. Filed Feb. 20, 1889. Serial No. 300,572. (No model.)

Claim.—1. A sheet-metal handle consisting of the upper part A, having a flat outer end, a longitudinally-bent body, and an inner end bent transversely at an angle to said body, said inner end having the flange a^3, combined with the lower part B, having a flat outer end, a longitudinally-bent body, and an inner end bent transversely at an angle to said body, said two parts being fastened together at their outer and inner ends, respectively, substantially as and for the purpose specified.

2. A sheet-metal handle formed from a single piece of sheet metal, consisting of a straight central portion having at one side thereof a part A, having a longitudinally-bent body and an end bent transversely at an angle to said body and having at the other side a part B, having a longitudinally-bent body and an end bent transversely at an angle thereto, said piece of metal being bent transversely in its flat middle portion to bring the two parts A and B together, substantially as and for the purpose specified.

413,641. ECCENTRIC-HOOK FOR STEAM-ENGINES. SEWARD R. RABBITT, Allegheny, and ALFRED RANDOLPH, Pittsburg, assignors to said Rabbitt and the Robinson-Rea Manufacturing Company, Pittsburg, Pa. Filed July 25, 1888. Serial No. 318,640. (No model.)

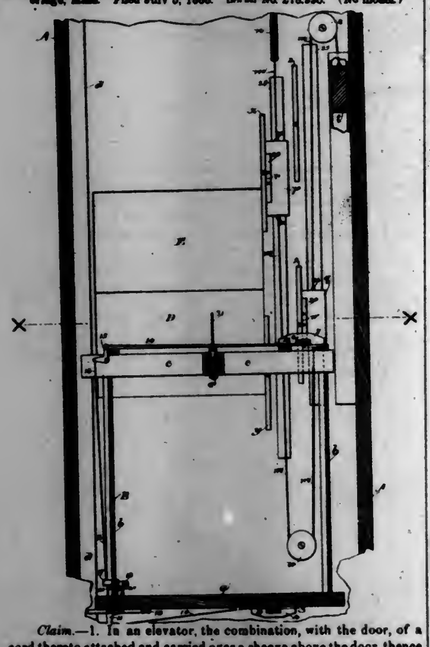
Claim.—1. In combination with the eccentric-rod and rocker-arm or valve-slide of a steam-engine, a block having a cavity to receive the rocker-arm pin and means of attaching it thereto, a bore for receiving the eccentric-rod, and a bolt and cam for rigidly connecting or disconnecting at pleasure the eccentric-rod and rocker-arm or slide-valve, substantially as described.

2. The combination, as an eccentric-rod hook, of a block A, having a cavity for the pin of the rocker-arm or slide-valve and means for attaching it thereto, a bore for the eccentric-rod, and a cam J and cam-bolt H, operated by said cam, and a handle K for operating the cam, substantially as described.

3. The combination, as an eccentric-rod hook, of a block A and means of attaching the same to the rocker-arm or slide-valve of a steam-engine, such block having a bore to receive the eccentric-rod, with a cam-bolt entering said bore, and a cam having a weighted handle, constructed and arranged substantially as described.

4. The combination of the eccentric-rod and rocker-arm or valve-slide of a steam-engine, a block A, having means of attachment to such rocker-arm or valve-slide, a bore to receive the eccentric-rod, a bevel-pointed cam-bolt entering said bore, and a cam to operate said bolt, substantially as and for the purposes described.

413,642. COMBINED PULVERIZER AND CULTIVATOR. GEORGE W. RAMSEY, Lower Lake, Cal. Filed Feb. 7, 1889. Serial No. 299,082. (No model.)



Claim.—1. The combination of the roller-frame, the forward-extending bars D, the lever Y, fulcrumed on a support on said bars, the pulverizer-frame having its rear side hinged to the roller-frame and having its front side connected to lever Y, the cultivator-frame having its front side hinged to the front side of the pulverizer-frame, and the hand-lever attached to the cultivator-frame, whereby the frame may be inclined to any desired angle, substantially as described.

2. The combination, with the roller-frame, of the forward extending beams B, secured thereto, the drive-wheel supporting the front ends of said beams, the pulverizer-frame hinged to the front side of the roller-frame, the draft-links connecting the front side of said pulverizer-frame to the bars B, the lever to raise and lower the pulverizer-frame, the cultivator-frame having its front sides hinged to the front side of the pulverizer-frame and provided with the forward-

extending pulverizer-teeth, and the lever attached to the cultivator-frame and adapted to incline the same, substantially as described.

3. The combination of the main frame, the tilting cultivator-frame, the vertically-adjustable pulverizer-frame, the operating-levers, and the roller, all combined and arranged substantially as herein set forth.

413,643. ELEVATOR-HATCHWAY. NELSON BOCKWITH, Cambridge, Mass. Filed July 5, 1888. Serial No. 278,995. (No model.)

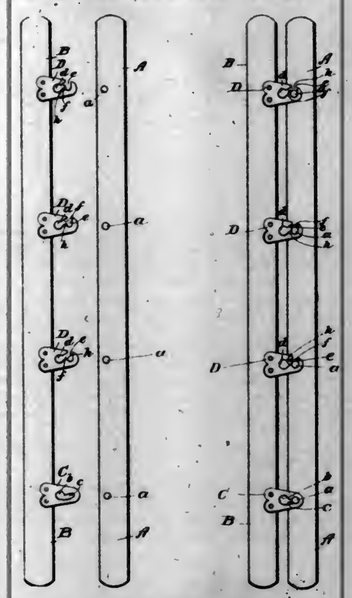
Claim.—1. In an elevator, the combination, with the door, of a cord thereto attached and carried over a sheave above the door, thence around a lower sheave, thence over an upper sheave, and having a suitable weight attached to its pendent end to counterpoise the door, two catch-blocks secured to said cord and provided with suitable catches, one of said blocks being arranged to open and the other to close the door when actuated, two catch-bars arranged upon the cage with springs to force them into contact with said catch-blocks, and cams duly positioned to disengage said bars, all substantially as specified.

2. In an elevator, the combination, with the door, of the cord *m*, sheaves *n*, *u*, and *s*, the weight *t*, the catches *v w*, connected with said cord, the cams *x*, *y*, *z*, and 2, duly arranged to coact with said catches, and the catch-bars 3 and 6, provided with the actuating-springs, all substantially as specified.

3. The combination, with the leaf D and the means for raising and lowering it, consisting of cord *m*, the sheaves *n u s*, the weight *t*, catches *v w*, the cams *x y z* 2, and the bars 3 6, with their engaging-springs, of the door E, the cord *f*, its supporting-sheaves, the arm 19, and the weight A, substantially as specified.

4. In an elevator-hatchway-operating device, the catch-blocks formed with a recess or mortise, catch-piece 20, having a projection 21, and springs 23, arranged between said projection and the end wall of said mortise, to cushion the force exerted upon said blocks, substantially as specified.

5. In an elevator, the combination, with the cage, the door, and the catch-blocks and catch-bars, of studs 12 17, arranged in the floor of the cage, respectively connected with said bars, whereby either bar may at will be held inoperative, substantially as specified.

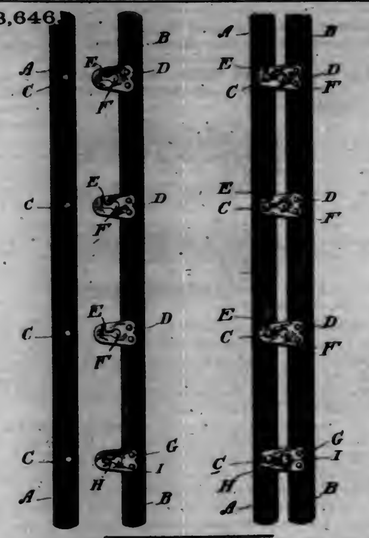


6. The combination, with studs 12 17, connected to actuate the catch-bars and formed with a seat or recess 27, of a catch or detent 26, wherewith said seat may at will be engaged, substantially as specified.

413,644. WATCH-PROTECTOR. THOMAS BENFIELD, Newark, N. J., SAMUEL AUFHAMMER, New York, N. Y., and ALEXANDER MILNE, Newark, N. J.; said Benfield and Aufhammer assignors to said Milne. Filed May 21, 1889. Serial No. 311,831. (Model.)

Claim.—As a new article of manufacture, a watch-protector adapted to contain or hold a watch and constructed of sheet-iron in two sections B B, the latter being provided with the projections *b*, and joined together by means of a coiled-spring hinge, consisting of the pintle *c*, and spring *d*, protected by the leather or other material *l*, allowing said protector to be opened and the watch consulted without removing said watch from the protector, the inner surfaces of said sections B being covered with plush or other fabric, and the outer surfaces with japan, paint, or other like substance, substantially as set forth.

413,645. CORSET-CLASP. WILLIAM F. BROOKS, Bridgeport, Conn. Filed June 21, 1889. Serial No. 315,061. (No model.)



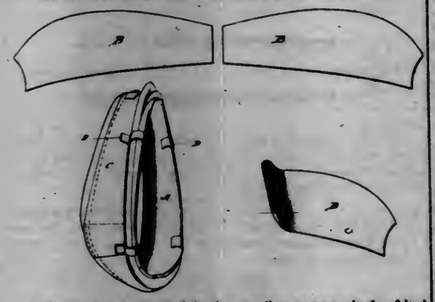
Claim.—1. In a corset-clasp, the steel B, having secured thereto the hooks D, having eyes *d*, vertical open gates *e*, inclined slots *f*, connecting said eyes and gates, and locking-points A at the outer ends of said slots, in combination with the steel A, having secured thereto the headed studs, substantially as set forth.

2. In a corset-clasp, the steel having secured thereto the hooks provided with eyes in the same vertical plane, one of said hooks having a closed recess leading upwardly from the eyes, the rest of the hooks having gates in the same vertical plane, and inclined slots leading from said eyes into the gates at a point above the bottom of the latter, in combination with the steel having secured thereto the headed studs, substantially as set forth.

413,646. CORSET-CLASP. WILLIAM F. BROOKS, Bridgeport, Conn. Filed July 6, 1889. Serial No. 316,667. (No model.)

Claim.—A corset-clasp comprising two busks and steels, one having studs and the other provided with a series of hooks having horizontal key-hole slots with vertical openings at the narrow ends of said slots, and a plate or hook at the lower end of said steel provided with a closed horizontal key-hole slot, substantially as set forth.

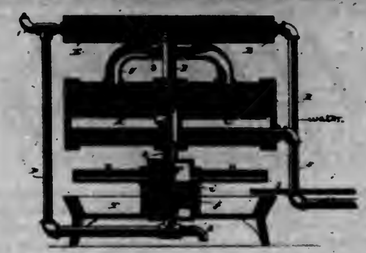
413,646.



413,647. METHOD OF FORMING STITCHES. ALFRED A. CURTIS, Hingham, Mass. Filed Jan. 21, 1889. Serial No. 297,046. (No model.)

Claim.—The method of forming a stitch which comprises passing a thread through a hole in the material or pieces to be united, forming a loop upon the opposite side of said material; second, in passing into and through said loop a loop of another thread; third, in passing through the second loop a loop of still another or locking thread, and, fourth, drawing the loops of said threads into the hole of the material or fabric, substantially as described.

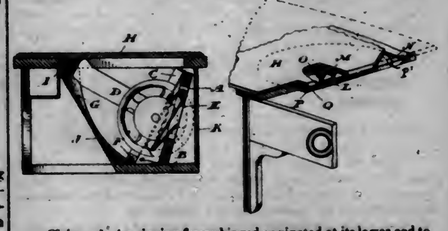
413,648. SWEAT-PAD. JAPHET S. CONDON, De Kalb, Ill., assignor of two-thirds to Joseph F. Glidden and Chase B. Glidden, same place. Filed Mar. 12, 1888. Serial No. 266,972. (No model.)



Claim.—1. A sweat-pad for horse-collars, composed of a felted fabric in flattened tubular form, whereby the parts have direct contact and are adapted to move upon each other, substantially as described.

2. A sweat-pad for horse-collars, formed of two lobes, each composed of a flattened seamless tubular body of felt thicker at one edge than at the other, substantially as described.

3. The combination of the sweat-pad herein described, made of felt and in flattened tubular form, with a horse-collar and means, substantially as described, for securing the pad to the collar.



413,649. HYDROCARBON-BURNER. HENRY C. DAVIS, Terre Haute, Ind. Filed Jan. 19, 1889. Serial No. 296,950. (No model.)

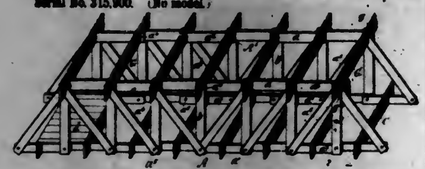
Claim.—1. In a hydrocarbon-burning apparatus, the combination of the burners, a casing divided to form a retort C and a superheater A, connected with each other by the pipe *g*, a water-heater, heated by the said burners, but arranged away from immediate proximity thereto, a mixing-chamber, and the connecting-pipes between the superheater and the mixing-chamber and the water-heater and the mixing-chamber, substantially as set forth.

2. In a hydrocarbon-burning apparatus, the combination of the burners, the oil-retort C, and the superheater A, situated above the burners, the pipe *g*, connecting the retort and the superheater, the water-heater arranged above the retort and superheater, and the conducting-pipes for leading the hydrocarbon vapor and the steam to the burner, substantially as set forth.

413,650. SEWING-MACHINE STAND. CHARLES A. DEARBORN, New York, N. Y. Filed Dec. 1, 1888. Serial No. 292,290. (No model.)

Claim.—1. A swinging frame hinged or pivoted at its lower end to the bottom B at a point below an opening in the top of a stand, in combination with a platform hinged to the swinging frame and designed to support a sewing-machine, substantially as and for the purpose specified.

2. A swinging frame hinged or pivoted at a point below an opening in the top of a stand, a platform hinged or pivoted to the swinging frame and designed to support the sewing-machine, in combination with a spring designed to act against the platform to partially counterbalance the weight of the sewing-machine, substantially as and for the purpose specified.

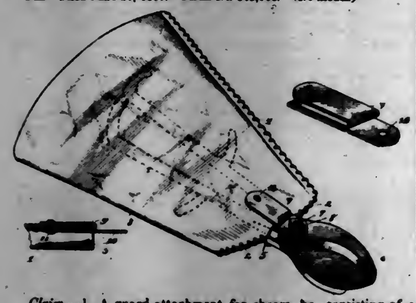


3. A swinging frame hinged or pivoted at a point below an opening in the top of a stand, a platform hinged to the swinging frame and designed to support the sewing-machine, a roller journaled on the front edge of the platform, in combination with a slanting curved track for the roller, and a ledge to support the platform in a horizontal position, substantially as and for the purpose specified.

4. A swinging frame hinged or pivoted at a point below an opening in the top of a stand, a platform hinged or pivoted to the swinging frame and designed to support the sewing-machine, a roller journaled on the front edge of the platform, in combination with a spring designed to act against the platform to partially counterbalance the weight of the sewing-machine, a slanting track for the roller, and a ledge to support the platform in a horizontal position, substantially as and for the purpose specified.

5. A swinging frame hinged or pivoted at a point below an opening in the top of a stand, a platform hinged or pivoted to the swinging frame and designed to support the sewing-machine, in combination with a top pivoted so as to overlap the top of the stand when its major portion is thrown clear of the stand, and to swing over to cover the opening in the top of the stand to form the stand into an ordinary table.

6. The plate M, having a center pin L secured to it and fastened to the bottom of the top H, a leg P, fixed to the plate M and designed to fit below the bracket Q, which is attached to the top plate N, substantially as and for the purpose specified.

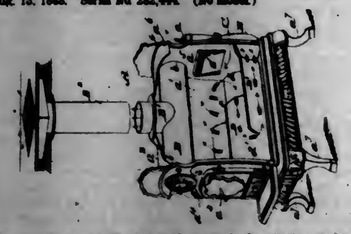


413,651. STRIP OR PIECE FOR BUILDING TOY GIRDERS, BRIDGES, &c. RUSSELL DUANE, Philadelphia, Pa. Filed June 28, 1889. Serial No. 315,900. (No model.)

Claim.—1. The herein-described toy, consisting of the longitudinal strips, the vertical struts, the tie-pieces diagonally disposed and said strips or pieces pinned to each other, the slotted spanning-strips, and the transverse tie-pieces, all arranged substantially as shown, and for the purposes set forth.

2. The herein-described toy, consisting of the longitudinal truss-chord strips or pieces, struts, and diagonally-disposed tie-pieces pinned to each other, the slotted spanning-strips, the slotted transverse tie-pieces, and the recessed floor-strips, all arranged substantially as shown, and for the purposes set forth.

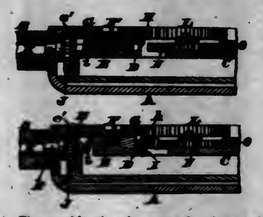
413,652. PRUNING-SHEARS GUARD. DAVID A. DUNHAM, Palatka, Fla. Filed June 29, 1889. Serial No. 315,968. (No model.)



Claim.—1. A guard attachment for shears, &c., consisting of a cone-shaped flexible guard entirely inclosing the handle of the shears and open at the rear end only, and made of a single piece of material, and attached to the shears solely by a metallic clip.

2. A guard attachment for pruning-shears, of a cone shape, having a central opening at its apex provided with a sheet-metal clip perforated for the reception of the pivot-bolt of a pair of shears, substantially as specified.

3. The combination, with a pair of shears having a pivoted bolt, of a cone-shaped guard attachment made of leather, and having an opening at its upper end and provided with a sheet-metal plate riveted to the guard and having an opening through which is passed the pivot-bolt of the shears, and a nut mounted on the pivot-bolt, substantially as specified.



4. The combination, with a pair of shears having a pivot-bolt and nut, of a leather guard attachment of a cone shape, the apex of which is provided with an opening, and of a metal plate having a U-shaped arm embracing the edge of the opening and having its inner half bent upon itself and projecting beyond the opening, and provided with a perforation for the reception of the pivot-bolt, and a rivet passing through the three thicknesses of metal and the guard, substantially as specified

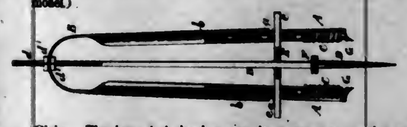
413,653. HEATING-STOVE. GILES F. FILLEY, St. Louis, Mo. Filed Aug. 13, 1888. Serial No. 282,444. (No model.)

Claim.—As an article of manufacture, the herein-described heating-stove having the T-shaped hot-air flue B B' in the top of its combustion-chamber, the circuitous smoke-flue D D', and the escape-flue E, into which said smoke-flue discharges, substantially as specified.

413,654. STEM WINDING AND SETTING WATCH. DAVID H. FLINT, Cincinnati, Ohio. Filed Feb. 12, 1889. Serial No. 299,561. (No model.)

Claim.—1. The combination, in a watch, of a winding mechanism, a hand-setting mechanism situated in a lower plane, a tilting wheel driven by geared connection with the stem or push-pin, and a lifter that actuates said tilting wheel and throws it in gear either with the winding or setting mechanism, said lifter being operated by said stem, substantially as herein described.

2. The combination, in a watch, of a winding mechanism, as L, a hand-setting mechanism, as N, situated in a lower plane, a tilting wheel H, turning upon the stud E and driven by the pinion J of stem K, and a lifter I, fitted around said stud and having a leg *i*, operated by the arbor *k* of said stem, substantially as herein described.



3. The combination, in a watch, of pendant B, traversed by the stem or push-pin K, the plate C, having a sloping pit D and a pair of slots *c c'*, the stud E, projecting from said pit, a tilting wheel H, turning upon said stud and driven by a pinion J of said stem K, a lifter I, fitted around said stud and having a leg *i*, operated by the arbor *k*, winding mechanism, as L, and setting mechanism, as N, as herein described.

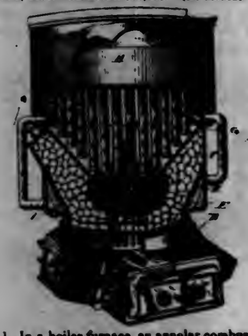
413,655. PENCIL-CLASP. FRANK H. FOSTER, Chicago, Ill., assignor to himself and George Orvis, same place. Filed June 15, 1889. Serial No. 314,508. (No model.)

Claim.—In a pencil-holder, a wire B, bent to form the loops *c* and *e* and coils *d*, in combination with a plate A, having one end bent over around the coils, substantially as and for the purpose specified.

413,656. TOOL FOR FINISHING GLASS BOTTLES. GEORGE CARTON, Millville, N. J. Filed July 5, 1889. Serial No. 316,333. (No model.)

Claim.—The jaws A A, having opposite grooves *a a* and a pair of threading-rolls in each, combined with a centering-plug D, carrying the top-smoother F, all constructed and arranged substantially as shown, and for the purposes specified.

413,657. TENSION APPARATUS FOR SEWING-MACHINES. JAMES R. A. GIBBS, Rapidan, Va., assignor to the Wilcox & White Sewing Machine Company, New York, N. Y. Filed June 18, 1888. Serial No. 277,441. (No model.)



Claim.—1. A tension apparatus composed of, first, a rotary grooved wheel or pulley for the thread; second, means for applying friction to said wheel or pulley; third, a casing with portions thereof on opposite sides of said wheel or pulley and provided with flanges or projections that cover the edges of the groove in said wheel or pulley, leaving a slit or slot for the insertion of the thread, and, fourth, means whereby the portion of the casing on the outside of the wheel or pulley, as well as the inside portion thereof, is kept from turning with said wheel or pulley, substantially as described.

2. A tension apparatus having a rotary grooved wheel or pulley formed of a disk with the edge slit and the teeth thus formed bent in opposite directions, and a casing with flanges or projections that cover the edges of the groove, leaving a slit or slot between them and having the outside of one at least of said flanges sloped inward toward the slit or slot, the said tension being further provided with means for applying friction to the said wheel or pulley and with means whereby the said casing is kept from turning with the wheel or pulley, substantially as described.

3. A tension apparatus comprising, in combination with a rotating grooved wheel or pulley and a tension-spring for applying pressure thereto, a non-rotating two-part casing having flanges or projections over the edges of the groove in said wheel or pulley, leaving a slit or slot between them for the insertion of the thread, one of said flanged parts being interposed between the said wheel or pulley and the said tension-spring, and being movable toward and away from the said wheel or pulley, so as to convey thereto the pressure of said spring, substantially as described.

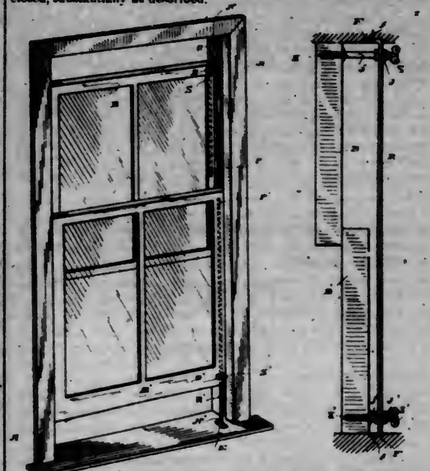
4. The combination, with the tension-stud and grooved wheel or pulley, of the non-rotating casing-disks or parts of the casing, one of them movable lengthwise of said stud and both provided with flanges or projections over the edges of the groove in said wheel or pulley, the friction-washers, the tension-spring, and the nut, substantially as described.

413,658. STEAM-BOILER. CHARLES GORTON, New York, N. Y. Filed Feb. 23, 1889. Serial No. 300,856. (No model.)

Claim.—1. In a boiler-furnace, an annular combustion fuel-reservoir and combustion-chamber formed between a depressed upper and lower section, substantially as described.

2. In a boiler-furnace, a combustion-chamber formed between two annular sections, each of said sections being of inverted conical shape and having openings in their center, as described.

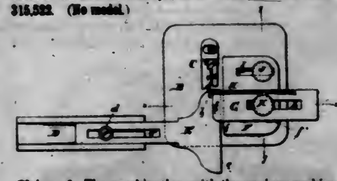
3. In a boiler-furnace, the combination of an annular combustion-chamber formed of two sections of inverted cone shape, one diverging from a horizontal plane more than the other, whereby the reservoir is given a tapering form, substantially as described.



4. The combination, in a furnace, of a reservoir and combustion-chamber consisting of an upper and lower section, each being centrally depressed and having central openings varying in diameter, substantially as set forth.

5. The combination, in a furnace, of a fuel-reservoir and combustion-chamber, of an upper and lower section centrally depressed, having central openings of varying diameter, and the feeding-chutes and smoke and gas deflecting ring, substantially as described.

413,659. SASH-FASTENER. KENNEDY GRAHAM, Winnipeg, Manitoba, Canada. Filed July 12, 1889. Serial No. 317,362. (No model.)



Claim.—1. In a window-fastener, the combination of a vertical rod which is attached to the window-casing, and which fits into a longitudinal perforation in the window-sash, a jaw which surrounds said rod and is set in the window-sash, and a set-screw which is mounted in said jaw and bears against said rod, substantially as described.

2. In a window-fastener, the combination of a vertical rod which is attached to the window-casing, and which fits into a longitudinal perforation in the window-sash, a jaw which surrounds said rod and is set in the window-sash, and a set-screw which is mounted in said jaw and bears against said rod, together with a notch cut in said rod at that point where it is seized by the clamp when the window is closed, substantially as described.

3. In a window-fastener, the combination of a vertical rod attached to the window-casing, a jaw which surrounds said rod and is attached to the window-sash, and a set-screw which is mounted in said jaw and bears against said rod, together with a notch in said rod at the point opposite the set-screw when the window is closed, which notch has a beveled lip which bears upon the side of the set-screw from which the sash should be forced to insure complete closure of the window, substantially as described.

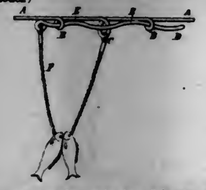
413,660. TUCKING ATTACHMENT FOR SEWING-MACHINES. GEORGE W. GREEN, Brooklyn, N. Y. Filed June 25, 1889. Serial No. 315,522. (No model.)

Claim.—1. The combination, with the sewing-machine and cloth-plate, of a presser-foot having a needle-opening, a long U-shaped frame D, secured to the main frame of the machine below the cloth-plate and having its upper end approximately in the same plane with the cloth-plate, forming a large space between its ends for the passage of the cloth below the cloth-plate, a guide E, adjustably supported by the upper end of the frame D above the cloth-plate, having an edge *e* in a line to one side of the needle-opening, a guide adjustably clamped to the cloth-plate, forming a narrow slot with the edge of the guide E, an overhanging guide-plate G, supported upon the guide F and extending above the guide E, and a finger A, arranged above the plate E and slightly beyond the edge of said plate G.

2. The combination, with the cloth-plate, a presser-foot having a slot extending past and to one side of the needle, and needle of a sewing-machine, of adjustable guides E and F, forming a longitudinal guideway between them and toward the presser-foot, an adjustable overhanging guide-plate G, extending above the plate E, and a finger A, arranged above the plate E and slightly beyond the edge of the plate G, to which it is secured.

3. The combination, with a presser-foot having a longitudinal slot extending past the needle-hole, of a guide-plate E, over which the cloth is folded and from which it passes to the presser-foot, a guide-plate G and finger A, arranged above the edge of the plate E, and in which the space between the edge of the plate G and finger A is in line with the slot of the presser-foot, and a support for the plate G.

4. The combination, with the presser-foot having a longitudinal slot extending past the needle-hole, of a guide-plate E, over which the cloth is folded and from which it passes to the presser-foot, a guide-plate G, and spring-finger H A, carried by the plate G and arranged



above the edge of the plate E, and in which the space between the edge of the plate G and finger *h* is in line with the slot of the presser-foot, and a support for the plate G.

5. The combination of a sewing-machine having a presser-foot C, formed with a longitudinal slot *c*, extending past the needle-opening and terminating in an oblique transverse slot T, with guides, substantially as set out, for folding the cloth into a fold for forming a tuck.

6. The combination of a sewing-machine having a presser-foot C, formed with a longitudinal slot *c*, extending past the needle-opening and having an oblique entrance and terminating in an oblique transverse slot T, with guides, substantially as set out, for folding the cloth into a fold for forming a tuck, and a guide for turning up the previously-formed tuck into position to enter the slot of the presser-foot.

413,661. DEVICE FOR STRINGING AND CARRYING FISH.

SYLPHEN S. HARMAN, New York, N. Y. Filed Apr. 13, 1889. Serial No. 307,150. (No model.)

Claim.—1. In a device for stringing fish, the bar A, with the loops B B, the string F, attached to the eyes C C, and the skewing-needle D, so arranged that the needle will pass through the loops B B, as herein described.

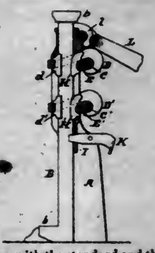
2. In a device for stringing and carrying fish, a chain or string having on one end a skewing-needle and on the other toggle-bar with a loop or loops formed upon it, through which the skewing-needle may be passed, thus forming a handle for the string, as herein set forth and described.

3. In a device for stringing fish, a skewing-needle of an undulated form, in combination with a string or chain and a toggle with a loop or loops upon it adapted to engage the needle, as herein set forth.

413,662. COMBINED CURRY-COMB AND BRUSH.

GUSTAVE HAVEMANN, New Bremen, Ohio. Filed July 15, 1889. Serial No. 317,528. (No model.)

Claim.—1. A curry-comb and brush of the character described, the cylinder or body of which is provided with the radial kerfs and radially-arranged blades having their inner edges properly secured therein and their outer or free working-edges converging in the center to an approximately V-shaped form, substantially as described.



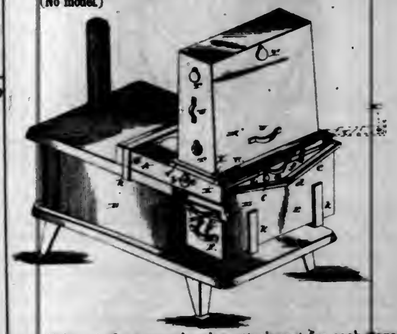
2. The combination, with the semicircular comb or blade portion of the cylinder, constructed as described, of the semicircular brush-backing secured in the semicircular recess of the body of the cylinder and provided with the bristles or other suitable material forming the brush portion or other half of the body of the cylinder, substantially as described, and for the purpose set forth.

413,663. LIFTING-JACK.

J. WESLEY HAWKINS, Kent, Ohio. Filed Aug. 12, 1889. Serial No. 320,551. (No model.)

Claim.—1. In a lifting-jack of the class designated, a clutch mechanism consisting of a bar bent to surround three sides of the lifting-bar and having hooked ends, a shaft resting in said hooked ends having crank-arms and bearing a cam, two shoes—one disposed between the lifting-bar and bent bar and the other between the lifting-bar and cam—and mechanism for moving said crank-arms to cause the shoes to clasp and release the lifting-bar, substantially as shown and described.

2. The combination, with the standard A and lifting-bar B sliding therein, of the clutch mechanism consisting of the yoke D, shaft C, cam E, arms *c*, and shoes *d* H, and the pivoted lever L, and links J for raising said bar, all constructed and arranged substantially as shown and described.



3. The combination, with the standard and the lifting-bar arranged to slide therein, of the lifting-clutch consisting of the yoke D, shaft C, cam E, shoes *d* H, and arms *c*, united with the pivoted lever L, by links J, and the retaining-clutch consisting of like parts, with the arms *c'* resting in the opening in the lugs *a'*, all constructed and arranged substantially as shown, and for the purpose specified.

4. The combination, with the standard, the lifting-bar mounted therein, and the retaining-clutch consisting of the yoke D', shaft C, cam E', shoes *d'* H', and arms *c'*, of the sliding plate I, to engage and raise the shoe H', and the pivoted foot-piece K, to actuate said plate, all constructed and arranged as shown.

5. In combination with the standard and the lifting-bar mounted therein, a pivoted lever, lifting and retaining clutches, each consisting of a yoke, a shaft-bearing, a cam, and end arms, shoes interposed between the lifting-bar and cams and yokes, respectively, a sliding plate to engage and raise one shoe of the retaining-clutch, and a pivoted lever to actuate said plate, all constructed and arranged substantially as shown and described.

413,664. STRAW-BURNING ATTACHMENT FOR STOVES.

JACOB L. HERMAN, Redfield, Dak. Filed Apr. 11, 1889. Serial No. 306,910. (No model.)

Claim.—1. In a straw-burning attachment for cook-stoves, the combination of the horizontal casing having the downwardly-extending ash-pit, and the grate-bars connecting the rear wall of said ash-pit with the top of the casing, substantially as herein set forth.

2. In a straw-burning attachment for cook-stoves, the combination of the horizontal casing having the downwardly-extending ash-pit, the grate-bars connecting the rear wall of said ash-pit with the top of the casing, and the fuel-box mounted removably upon the top of the casing directly above the ash-pit, substantially as herein set forth.

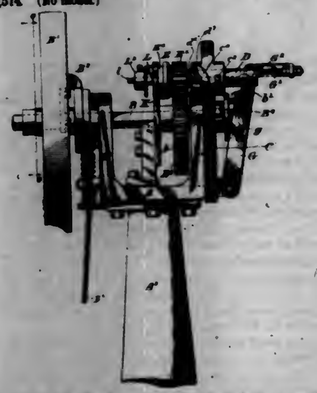
3. In a straw-burning attachment for cook-stoves, the herein-described horizontal casing adapted to rest upon the top of the cook-stove and having griddle-holes registering with the griddle-holes in the latter and provided with the downwardly-extending ash-pit, and the curved grate-bars connecting the rear wall of said ash-pit with the top of the casing, in combination with the fuel-box mounted removably upon said casing directly above the ash-pit, and an adjustable slide separating said fuel-box from the combustion-chamber, substantially as and for the purpose set forth.

4. The combination, with a cook-stove having a flanged top plate, of a straw-burning attachment comprising a casing mounted upon the top plate of the stove, projecting at one end, and having a downwardly-extending ash-pit and a fuel-box mounted removably upon the projecting end of the casing above the ash-pit, and a clamping or connecting strip arranged across the rear end of the casing and provided at its ends with downturned arms, the lower ends of which are provided with inturned lugs engaging the flange of the top plate of the stove, substantially as set forth.

5. The combination of the horizontal casing having the downwardly-extending ash-pit, the sliding box or ash-pan, the slide arranged above the latter and provided at its outer end with a flange and an upwardly-extending leg, and the door pivoted to the outer side of the casing and adapted to enter between the leg and the flange of said removable slide, substantially as herein set forth.

6. In a straw-burning attachment for cook-stoves, the combination of the horizontal casing having the downwardly-extending ash-pit, the grate-bars connecting the rear wall of said ash-pit with the top of the casing, the removable fuel-box provided with suitable draft-openings covered by pivoted slides, the adjustable slide arranged between the fuel-box and the combustion-chamber, and the slides arranged to cover suitable draft openings in the walls of the latter, substantially as and for the purpose herein shown and specified.

413,665. CREAMING-CAN.



LOUIS HUMMEL, New Bremen, Ohio. Filed July 22, 1889. Serial No. 318,243. (No model.)

Claim.—A cream-can consisting of the body A, provided with the annular chamber B, having an upper annular flange *b*, bottom *b'*, and re-enforcing braces C, having their ends secured to the body of the can and wall of the chamber, as shown, cover D, having the tube or air-inlet E, secured to the apex of said cover, depending annular flange *d* of the cover, resting upon the inclined re-enforcing braces C in the interior of the chamber B, screw-cap seat *e*, screw-cap F, and cream-gage G, all constructed and arranged as herein shown and described, as, and for the purposes set forth.

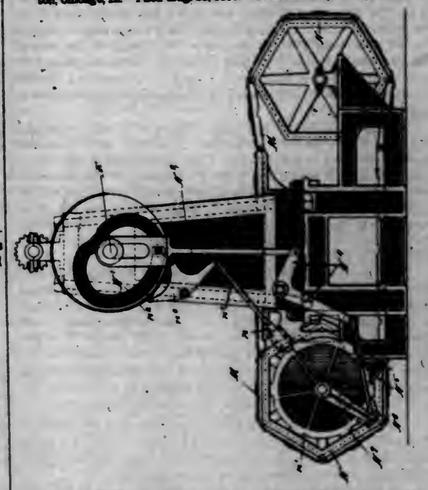
413,666. MACHINE FOR FASTENING THE ENDS OF COILED-WIRE SPRINGS.

CHRISTIAN C. HILL, Chicago, Ill., assignor to Charles L. Ames and Abel H. Frost, same place. Filed Nov. 12, 1888. Serial No. 290,514. (No model.)

Claim.—1. A machine for the purpose set forth, comprising a slotted twisting-head and a wire-holder for sustaining two wires, said wire-holder comprising a stationary part provided with a groove to receive one wire, and a slide-bar provided with a prong arranged to cover the groove and to form an anvil over which the other wire is bent during the fastening of the ends of the wires, substantially as described.

2. A machine for the purpose described, comprising a slotted twisting-head and a wire-holder for sustaining one wire in alignment with the axis of the head and a second wire adjacent to the first wire, said wire-holder consisting of a stationary part provided with a groove and a notch to receive the first wire and a notch to receive the second wire located above the groove, and a bar provided with a prong adapted to pass over the wire in said groove and beneath the wire held in the notch, substantially as described.

3. The combination, with a slotted twisting-head, of a wire-holder consisting of a stationary part provided with a groove and a notch to receive one wire and a notch located above said groove to receive another wire, and a slide-bar provided with a prong arranged to cover the wire in the groove and pass beneath the wire in the notch, and provided also with a notch or recess to receive the said second wire, substantially as described.



4. The combination, with a twisting-head and a wire-holder constructed to receive and hold a wire in line with the axis of the head and a second wire adjacent thereto, said twisting-head being provided with a bending-roller, and with a wiper, substantially as described.

5. The combination, with a slotted twisting-head, of a stationary spindle supporting the same, said spindle being provided with a longitudinal guide-groove, and a longitudinally-movable slide-bar mounted in said guide-groove, said spindle being provided with a groove and a notch to receive one wire and a notch to receive a second wire, and the slide-bar being provided with a prong arranged to cover the wire in said groove and to pass beneath the wire in the notch, substantially as described.

6. The combination, with a slotted twisting-head, of a stationary spindle supporting the same and provided with a wire-holder, said spindle being cylindric in its part engaged with the twisting-head, and a stationary arm bearing upon the outer face of the head to hold the same upon the spindle, substantially as described.

413,667. DOUBLE-ACTING GANG-DIE PRESS.

JOHN G. HOSMER, Maywood, Ill., assignor to Edwin Horton, same place, and Oliver W. Horton, Chicago, Ill. Filed Aug. 28, 1889. Serial No. 321,966. (No model.)

Claim.—1. The combination of an endless flexible intermittently-moving carrier M, having scrap-sheet-supporting plates m', provided with registering pins or bosses m^3, adapted to enter openings in the scrap-sheet, and a gang of dies arranged to cut blanks from the interstices in the scrap-sheet, substantially as specified.

2. The combination of an endless flexible intermittently-moving carrier M, having scrap-sheet-supporting plates m', provided with registering pins or bosses m^3, adapted to enter openings in the scrap-sheet, a gang of dies arranged to cut blanks from the interstices in the scrap-sheet, and mechanism for intermittently moving the carrier and locking or registering it in position, substantially as specified.

3. The combination, with intermittently-moving link-chain carrier M, of a die-plate or match-plate H, having passages or channels H^2 for the links of the chain, and a gang of dies, substantially as specified.

4. The combination of an intermittently-moving carrier M, furnished with sheet-holders m', and a die-plate H, having a recess H^4 for the reception of the sheet-holder m, substantially as specified.

5. The combination of an intermittently-moving carrier M, fur-

nished with sheet-holders m', a die-plate H, having a recess H^4 for the reception of the sheet-holder m', and means for raising such sheet-holder out of such recess as the carrier moves forward, substantially as specified.

6. The combination of an intermittently-moving carrier M, furnished with sheet-holders m', and a die-plate H, having a recess H^4 for the reception of the sheet-holders m', said die-plate H having a roller H^3, engaging a cam on the carrier for raising the sheet-holder out of the recess in the die-plate, substantially as specified.

7. In a gang-die press, the combination of two cross-heads B C with two gangs of male and two gangs of female dies, substantially as specified.

8. The double-acting gang-die press having two gangs of dies and two separate cross-heads for actuating the same, substantially as specified.

9. The combination, in a gang-die press, of an outer cross-head B and an inner cross-head C, die-plate c' and match-plate c^3, secured to said cross-head C, and die-plate b' and match-plate b^3, secured to said cross-head B below said plates c' c^3, and a gang of dies secured in said plates c' c^3 and a separate gang of dies secured in said plates b' b^3, substantially as specified.

10. The combination, in a gang-die press, of an outer cross-head B and an inner cross-head C, die-plate c' and match-plate c^3, secured to said cross-head C, and die-plate b' and match-plate b^3, secured to said cross-head B below said plates c' c^3, and a gang of dies secured in said plates c' c^3, a separate gang of dies secured in said plates b' b^3, and means for operating said cross-heads independently of each other, substantially as specified.

11. The combination, in a gang-die press, of an outer cross-head B and an inner cross-head C, die-plate c' and match-plate c^3, secured to said cross-head C, and die-plate b' and match-plate b^3, secured to said cross-head B below said plates c' c^3, and a gang of dies secured in said plates c' b^3, a separate gang of dies secured in said plates b' b^3, and a stripper or smoother plate F, substantially as specified.

12. The combination, in a gang-die press, of an outer cross-head B and an inner cross-head C, die-plate c' and match-plate c^3, secured to said cross-head C, and die-plate b' and match-plate b^3, secured to said cross-head B below said plates c' c^3, a gang of dies secured in said plates c' c^3, a separate gang of dies secured in said plates b' b^3, a bed-plate H' and match-plate H, a gang of cutting-dies h, secured in said plates H H', and a gang of forming-dies k, substantially as specified.

13. The combination, in a gang-die press, of an outer cross-head B and an inner cross-head C, die-plate c' and match-plate c^3, secured to said cross-head C, and die-plate b' and match-plate b^3, secured to said cross-head B below said plates c' c^3, a gang of dies secured in said plates c' c^3, a separate gang of dies secured in said plates b' b^3, a bed-plate H' and match-plate H, a gang of cutting-dies h, secured in said plates H H', and a gang of forming-dies k, said forming dies k being hollow and resting on movable tubular supports k', substantially as specified.

14. The combination, in a gang-die press, of an outer cross-head B and an inner cross-head C, die-plate c' and match-plate c^3, secured to said cross-head C, and die-plate b' and match-plate b^3, secured to said cross-head B below plates c' c^3, a gang of dies secured in said plates c' c^3, a separate gang of dies secured in said plates b' b^3, a bed-plate H' and a match-plate H, a gang of cutting-dies h, secured in said plates H H', and a gang of forming-dies k, said forming-dies k being hollow and resting on movable tubular supports k', said tubular supports k' being supported by springs k^3, substantially as specified.

15. In a gang-die press for cutting out blanks from the interstices of a scrap-sheet, the combination, with a gang of dies, of a scrap-sheet holder furnished with registering pins or bosses adapted to enter openings in the scrap-sheet, substantially as specified.

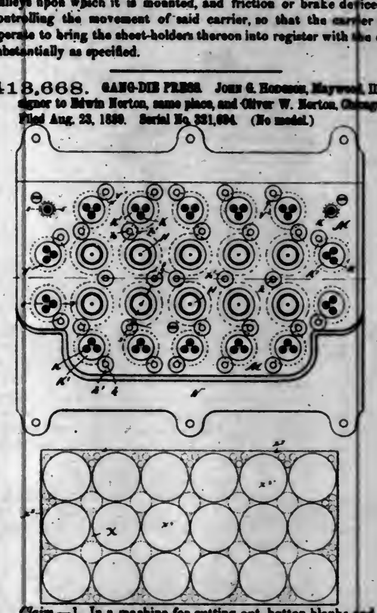
16. The combination, in a gang-die press, of a gang of dies with an intermittently-moving endless-chain carrier M, pulleys or wheels N N, cam N', link N^3, lever N^4, link N^5, pawl N^6, and ratchet N^7, substantially as specified.

17. The combination, in a gang-die press, of a gang of dies with an intermittently-moving endless-chain carrier M, pulleys or wheels N N, cam N', link N^3, lever N^4, link N^5, pawl N^6, ratchet N^7, lock-bolt n, said wheel N^7 having recesses n', cam n^2, lever n^3, and link n^4, substantially as specified.

18. The combination, in a gang-die press, of a gang of dies with an intermittently-moving endless-chain carrier M, pulleys or wheels N N, locking-bolt n, wheel N^7, provided with recesses n', cam n^2, lever n^3, and link n^4, substantially as specified.

19. The combination of an intermittently-moving endless flexible carrier with wheels or pulleys upon which it is mounted, such carrier being furnished with holders for supporting the sheet, and a pair of dies, substantially as specified.

20. The combination, with a gang of dies, of an intermittently-moving flexible carrier provided with holders for the sheets to be acted upon by the dies, whereby the sheets may be automatically carried to and register with the dies, substantially as specified.



21. The combination, with a gang of dies, of an intermittently-moving endless flexible carrier provided with holders for the sheets to be acted upon by the dies, whereby the sheets may be automatically carried to and register with the dies, said sheet-holders being provided with registering pins or devices for governing the position of the sheet on the holder, substantially as specified.

22. In a double-acting gang-die press, the combination of a cross-head B and its guides, a cross-head C and its guides, and two separate gangs of dies operated by said cross-heads, substantially as specified.

23. The combination, with a movable sheet-carrier furnished with sheet-holders, of a cross-head, a die operated thereby, a stripper plate or pad F, and a cam for operating it so that the stripper-plate may serve to keep the sheet in place on its die-holder as the die is withdrawn, substantially as specified.

24. The combination, in a gang-die press, of a gang of male and female dies, an intermittently-moving flexible carrier M, wheels or pulleys upon which it is mounted, and friction or brake devices for controlling the movement of said carrier, so that the carrier may operate to bring the sheet-holders thereon into register with the dies, substantially as specified.

413,668. GANG-DIE PRESS. JOHN G. HODGSON, Maywood, Ill., assignor to Edwin Norton, same place, and Oliver W. Norton, Chicago, Ill. Filed Aug. 23, 1889. Serial No. 321,694. (No model.)

Claim.—1. In a machine for cutting out button-blanks and can-caps from the interstices of a scrap-sheet, the combination, with a bed die-plate N, of a match-plate M, a gang of can-cap-cutting female dies H, a gang of button-blank-cutting female dies K, guide or gage pins V V', a reciprocating cross-head B, die-carrying plate E, secured thereto, match-plate F, a gang of can-cap-cutting male dies C, and a gang of button-blank-cutting male dies D, operated by said cross-head B, substantially as specified.

2. In a machine for cutting out button-blanks and can-caps from the interstices of a scrap-sheet, the combination, with a bed die-plate N, of a match-plate M, a gang of can-cap-cutting female dies H, a gang of button-blank-cutting female dies K, guide or gage pins V V', a reciprocating cross-head B, die-carrying plate E, secured thereto, match-plate F, a gang of can-cap-cutting male dies C, and a gang of button-blank-cutting male dies D, operated by said cross-head B, said male dies D being mounted in stock-blocks D', secured to said plates E F, substantially as specified.

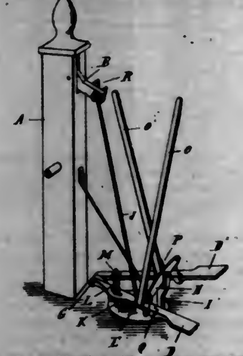
3. In a machine for cutting out button-blanks and can-caps from the interstices of a scrap-sheet, the combination, with a bed die-plate N, of a match-plate M, a gang of can-cap-cutting female dies H, a gang of button-blank-cutting female dies K, guide or gage pins V V', a reciprocating cross-head B, die-carrying plate E, secured thereto, match-plate F, a gang of can-cap-cutting male dies C, and a gang of button-blank-cutting male dies D, operated by said cross-head B, and feed-tubes R, extending from said female dies K, substantially as specified.

4. In a machine for cutting out button-blanks and can-caps from the interstices of a scrap-sheet, the combination, with a bed die-plate N, of a match-plate M, a gang of can-cap-cutting female dies H, a gang of button-blank-cutting female dies K, guide or gage pins V V', a reciprocating cross-head B, die-carrying plate E, secured thereto, match-plate F, a gang of can-cap-cutting male dies C, and a gang of button-blank-cutting male dies D, operated by said cross-head B, feed-tubes R, extending from said female dies K, and receiving-tubes S, attached to said feed-tubes R, substantially as specified.

5. In a machine for cutting out button-blanks and can-caps from the interstices of a scrap-sheet, the combination, with a bed die-plate N, of a match-plate M, a gang of can-cap-cutting female dies H, a gang of button-blank-cutting female dies K, guide or gage pins V V', a reciprocating cross-head B, die-carrying plate E, secured thereto, match-plate F, a gang of can-cap-cutting male dies C, and a gang of button-blank-cutting male dies D, operated by said cross-head B, feed-tubes R, extending from said female dies K, and receiving-tubes S, attached to said feed-tubes R, said receiving-tubes S having frictional wads or pistons S' to support the blanks as they are fed into the receiving-tube, substantially as specified.

6. The combination, with a hollow female die, as K, of a feed-tube R, provided with a spring-catch r, for supporting the blanks in the feed-tube, substantially as specified.

7. The combination, with a hollow female die, of a feed-tube R and a receiving-tube S, substantially as specified.



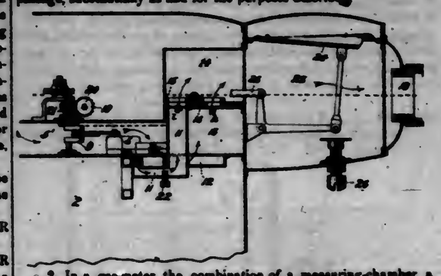
8. The combination, with a hollow female die, of a feed-tube R and a receiving-tube S, said receiving-tube S being furnished with a frictional wad or piston S', substantially as specified.

9. The combination, with a hollow female die, of a feed-tube R and a receiving-tube S, said receiving-tube being furnished with a frictional wad or piston S', and said feed-tube R having a spring-pawl r, substantially as specified.

10. In a machine for cutting blanks from the interstices of a scrap-sheet, the combination, with a gang of male and female dies arranged in a regular and definite order, of guide-pins or registering devices for registering the position of the scrap-sheet in respect to the dies, substantially as specified.

11. In a machine for cutting blanks from the interstices of a scrap-sheet, the combination, with a gang of male and female dies arranged in a regular and definite order, of guide-pins or registering devices for registering the position of the scrap-sheet in respect to the dies, and a smoother-plate descending in advance of the male dies for smoothing and flattening out the scrap-sheet, so that the interstitial spaces of the sheet will properly register with the gang of dies, substantially as specified.

413,669. ATTACHMENT FOR PUMPS. WILLIAM W. ROSS, Lansing, Mich. Filed June 12, 1889. Serial No. 314,017. (No model.)



Claim.—1. In combination with a pump, two treadles pivotally connected at one end to the standard G of the base E of the standard I, walking-beam H, connected to the treadles, the standard K, the nut or flange M, the spring L, and the connecting-rod J, the parts being arranged to operate substantially as described.

2. In combination with a pump, two treadles pivotally connected to the base, a walking-beam pivotally secured to said base, the connection between the end of the walking-beam and the treadles, a hinge in said treadles, whereby one end may be turned up out of the way, a spring acting with its tension upon one of the treadles, the connection between the treadle and the pump-handle, and the hand-levers O and O', the parts being arranged to operate substantially as described.

413,670. PROPORTIONAL GAS-METER. HYAM J. HYAMS, Pittsburg, Pa. Filed Nov. 5, 1888. Serial No. 289,973. (No model.)

Claim.—1. A gas-meter having a measuring-chamber, a by-passage through which passes gas having a known ratio in volume to the gas passing through the measuring-chamber, and pressure-regulating mechanism controlling the passage of gas through the measuring-chamber and by-passage, said pressure-regulating mechanism being situate on the delivery side of the meter and being subjected to the conjoined pressures of the gas from the measuring-chamber and by-passage, substantially as and for the purposes described.

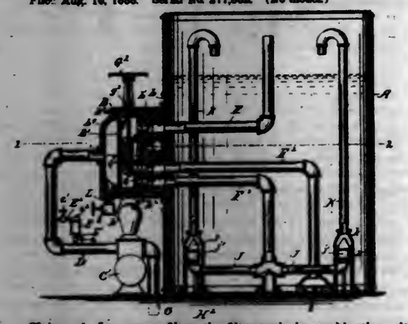
2. In a gas-meter, the combination of a measuring-chamber, a by-passage through which passes gas having a known ratio in volume to the gas passing through the measuring-chamber, ports affording communication between the by-passage and measuring-chamber, a common eduction-passage, a horizontal sliding valve controlling said ports, a pressure-regulator situate in said common eduction-passage, and a lever connecting the pressure-regulator with the horizontally-moving sliding valve, substantially as and for the purposes described.

3. A gas-meter having a measuring-chamber provided with moving mechanism, such as diaphragms, a by-passage, ports admitting gas into the measuring-chamber and into the by-passage, and a valve or valves which control the said ports and are operated by movement of the said diaphragms, a regulating-valve, and a pressure-regulator coupled to said regulating-valve and operating the same, accordingly as the pressure of gas is varied, substantially as and for the purposes described.

4. In a gas-meter, the combination of the measuring-chamber, a by-passage, a chamber 23, containing a pressure-regulator, ports i and k, leading from the by-passage and measuring-chamber into the chamber 23, and a valve or valves connected with the pressure-regulator and controlling the said ports, the said ports and valves being adapted to pass from the measuring-chamber and by-passage volumes of gas bearing a known ratio to each other, the port i being larger in area than that part of the area of the port or ports k which represents that fractional part of the whole volume of gas which is passed through said port i, for the purpose of compensating for the resistance of the measuring-chamber, and an outlet or eduction pipe leading from the chamber 23, substantially as and for the purposes described.

5. In a gas-meter, the combination of the measuring-chamber, a by-passage, a chamber 23, containing a pressure-regulator, ports i and k, leading from the by-passage and measuring-chamber into the chamber 23, a valve or valves connected with the pressure-regulator and controlling the said ports i k, the said ports and valve being adapted to pass from the measuring-chamber and by-passage volumes of gas bearing a known ratio to each other, the port i being larger in area than that part of the area of the port or ports k which represents that fractional part of the whole volume of gas which is passed through said port i, for the purpose of compensating for the resistance of the measuring-chamber, and an outlet or eduction pipe leading from the chamber 23, substantially as and for the purposes described.

6. In a gas-meter, the combination of the measuring-chamber, a by-passage, a chamber 23, containing a pressure-regulator, ports leading from the by-passage and measuring-chamber into the chamber 23, and a valve or valves connected with the pressure-regulator and controlling the said ports, the said ports and valve being adapted to pass from the measuring-chamber and by-passage volumes of gas bearing a known ratio to each other, and the said pressure-regulator being adapted, substantially as described, to cause the valve to close the ports as the pressure increases above the normal, and also to close the same as the pressure decreases below the normal, and an outlet or eduction pipe leading from the chamber 23, substantially as and for the purposes described.



7. A gas-meter having a measuring-chamber, a by-passage through which passes gas having a known ratio in volume to the gas passing through the measuring-chamber, an induction-pipe admitting gas to the measuring-chamber and to the by-passage, an eduction-pipe, and a pressure-regulator having a valve or valves which control the passage of the gas into the said by-passage and measuring-chamber and the passage of the gas from the same, substantially as and for the purposes described.

8. A gas-meter having a measuring-chamber provided with moving mechanism, such as diaphragms, a by-passage, ports admitting gas into the measuring-chamber and into the by-passage, a valve or valves

which control the said ports and are operated by movement of said diaphragms, and a pressure-regulator having a valve or valves which control the passage of gas from the measuring-chamber and by-passage, substantially as and for the purposes described.

9. A gas-meter having a measuring-chamber provided with moving mechanism, such as diaphragms, and a by-passage through which passes gas having a known ratio in volume to the gas passing through the measuring-chamber, an eduction-passage, ports through which the by-passage and measuring-chamber communicate with the eduction-passage, and a valve controlling the passage of gas through the ports both of the measuring-chamber and by-passage at the place of communication of the measuring-chamber and by-passage with the eduction-passage, substantially as and for the purposes specified.

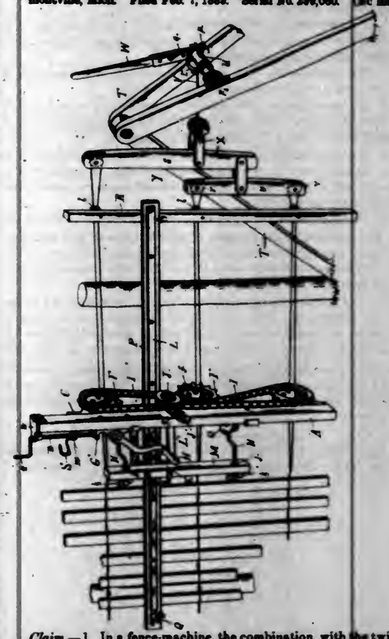
413,671. **WATER-FILTER.** OMAR H. JEWELL and IRA H. JEWELL, Chicago, Ill., assignors to the Jewell Pure Water Company, same place. Filed Aug. 16, 1888. Serial No. 277,362. (No model.)

Claim.—1. In a water-filter, the filter-tank, in combination with the valve-chest, the sliding valve G, arranged therein and recessed as described, the water-supply pipe opening into said valve-chest on one side of the valve, the four ports, and the four pipes connected to said ports, three of them—to wit, the wash-pipe and inlet and outlet pipes—extending into the tank, and the fourth connecting with the pure-water and waste pipes, substantially as and for the purposes specified.

2. In a water-filter, the filter-tank A, in combination with the valve-chest B, the recessed slide-valve G, arranged therein, and the supply-pipe D, said valve-chest being provided with the ports f, f' f^2, and f^3, the inlet-pipe F, outlet-pipe F^2, and wash-pipe F^3, connected, respectively, to the ports f, f^2, and f^3, and extending into the filter-tank, and the pipe F', connected to the port f', substantially as and for the purposes specified.

3. In a water-filter, the filter-tank, in combination with a single discharge-pipe leading from said tank and providing a single and common outlet for both the filtered water and the wash-water, a pure-water-supply pipe and a separate waste-pipe, both having a common junction with the said discharge-pipe outside of the filter, and a three-way valve at the junction of the said three pipes, substantially as and for the purposes specified.

4. In a water-filter, the filter-tank, in combination with the discharge-pipe F', forming the only outlet for both filtered water and wash-water from the tank, a pure-water-supply pipe H' and a waste-pipe H^2, separate from each other, and a three-way valve H, into the casing of which the pipe F', the waste-pipe H^2, and the pure-water pipe H' all open, the two former into one and the same chamber and the latter into the opposite chamber, and provided with two seats for the valve, one in the diaphragm which divides the casing into chambers and the other at the junction between the wash-pipe and said casing, substantially as and for the purposes specified.



413,672. **FELLY-JOINT HOLDER.** MILTON KERCH and BENJAMIN M. MILLER, Conyngham, N. Y. Filed June 19, 1889. Serial No. 314,572. (No model.)

Claim.—1. The felly-joint comprising the wedge-shaped body 8, having the bolt-shanks 11 at its foot, the side flanges 10 to bear against the sides of the fellies, and the head-flanges 9 to bear against the edges of the tire, substantially as described.

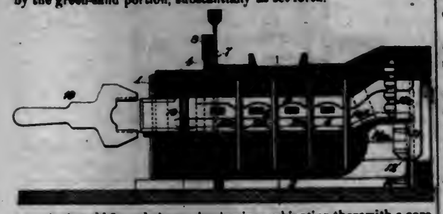
2. The combination of the fellies having their approaching ends cut to form a wedge-shaped opening between them, the wedge-shaped body 8 in said opening and having the side flanges 10, bearing against the sides of the fellies, the head flanges 9, bearing against the edges of the tire, and the bolt-shanks 11, projecting from its foot, the clip-plate 5, bearing against the inner sides of the jointed fellies and having the hole a on the shank 11, and the end slots 6 7, and the bolts 4 5 in the ends of the fellies and extending through the end slots, said bolts and shanks having the nuts to clamp the clip-plate to the fellies, substantially as described.

413,673. **PICKET-FENCE MACHINE.** FRANKLIN W. KELLY, Vermontville, Mich. Filed Feb. 7, 1889. Serial No. 299,080. (No model.)

Claim.—1. In a fence-machine, the combination, with the twister-frame, of the rectangular outrigger-frame pivotally secured at one side to the standard of the twister-frame, the bar M on the outrigger-frame, and the bumpers O, all substantially as and for the purpose specified.

2. The combination, with the standard of the machine, of the outrigger-frame L', pivotally secured thereto and provided with the travelers K, the bar M, secured to said outrigger-frame, the rods N, having the hooked ends pivotally engaging into sockets in the bumper O, and the adjusting thumb-nuts k and k' on the screw-threaded ends of said rods, all arranged to operate substantially as described.

3. In a picket-fence machine, a vertically-adjustable picket-guide carried by a screw-nut engaging with an adjusting-screw, substantially as described.



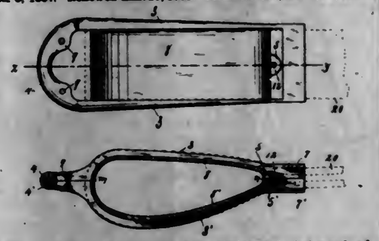
4. In a picket-fence machine, the combination, with the twister-frame, of a vertically-adjustable picket-guide S, provided with the nut m and the adjusting-screw n engaging into said nut, and provided with a crank-handle o, substantially as described.

413,674. **MOLD.** JACOB KERNER, Pittsburg, Pa., assignor, by mesne assignments, to the Kerner & Jones Manufacturing Company, same place. Filed Mar. 5, 1888. Serial No. 301,971. (No model.)

Claim.—1. A mold for axle-boxes, having in combination therewith a core consisting of a green-sand portion and a baked-sand portion molded into the green-sand portion, substantially as set forth.

2. A mold for axle-boxes, having in combination therewith a core consisting of a green-sand portion and a baked-sand portion having an opening therethrough and a core-bar extending through and supporting both portions of the core, substantially as set forth.

3. A mold for hollow articles, having in combination a core consisting of a green-sand portion and a baked-sand portion having an opening therethrough, the latter being molded into and held in position by the green-sand portion, substantially as set forth.



4. A mold for axle-boxes, having in combination therewith a core, a core-bar notched as described, and extending through the core, and slotted supporting-plates, the walls of the slots constructed to engage the notches in the core-bar when in normal position, the slots being made of such dimensions relative to the core-bar as to permit the longitudinal movement of the bars through them when shifted from normal position, substantially as set forth.

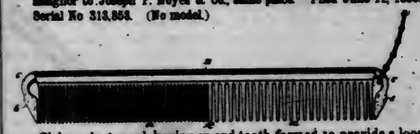
413,675. **COFFIN-FASTENER.** WILLIAM C. LANGSHAW, Brooklyn, Ohio. Filed June 17, 1889. Serial No. 314,555. (No model.)

Claim.—In a fastener for coffins, the combination of a notched bolt attached to the casket and extending into a cavity in the side thereof, a staple and plate in the top of the casket, a loop depending from said plate, and a catch with spring and thumb-piece, constructed and arranged substantially as and for the purpose set forth.

413,676. **MARTINGALE-LOOP.** JOHN LOSS, Freeport, Ill. Filed Feb. 5, 1887. Renewed Mar. 20, 1889. Serial No. 305,337. (No model.)

Claim.—The metallic harness-loop consisting of the independently-formed halves 8 8', having at their opposite margins the flanges 3 3 3' 3', respectively, the bars 4 7, joining the flanges 3 3, the bars 4' 7', joining the flanges 3' 3', the uniting-lugs 5 5', and the rivets 9 9 12, uniting the two parts into a rigid whole, substantially as and for the purpose set forth.

413,677. **WHEELBARROW.** JAMES W. MALOY, Marietta, Ga. Filed Dec. 17, 1888. Serial No. 293,790. (No model.)

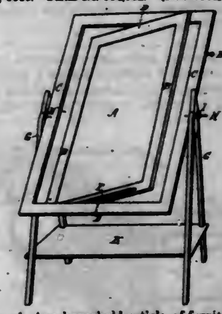


Claim.—1. A wheelbarrow having a supporting dished wheel turning upon an inclined axle and mounted beneath the body of the barrow, with the lower part of the rim of the wheel central vertically with said body, substantially as set forth.

2. A wheelbarrow having a supporting dished wheel mounted upon an inclined spindle or shaft, a bearing for the upper end of the shaft arranged to bring the ground-bearing of the wheel substantially centrally beneath the barrow-body, and a bearing for the opposite end of the said shaft carried by an arm or bracket projecting from a sill of the barrow, substantially as set forth.

3. A dished supporting-wheel adapted for a wheelbarrow having a hub, a rim, and a series of straight radial and series of inclined spokes between the hub and rim, substantially as set forth.

4. A dished supporting-wheel adapted to be used with a wheelbarrow having a spindle, a hub 1 2, mounted thereon, a series of inclined spokes extending between the part 1 of the hub and the wheel-rim, and a series of direct radial spokes extending between the part 2 of the hub and the wheel-rim, substantially as set forth.



413,678. **DRESSING-COMB.** JOSEPH P. HOYER, Binghamton, N. Y., assignor to Joseph P. Hoyer & Co., same place. Filed June 11, 1889. Serial No. 313,853. (No model.)

Claim.—1. A comb having an end tooth formed to provide a loop or ring, as c, for the attachment of a cord or chain, substantially as described.

2. A comb consisting of the comb proper, a metallic back B, and an end tooth integral with said back, formed to provide a loop c, substantially as described.

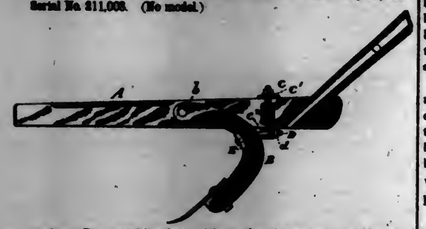
413,679. **BLACKBOARD.** JOHN H. OSBORN, Titusville, Pa. Filed Mar. 27, 1889. Serial No. 304,962. (No model.)

Claim.—1. As a household article of furniture or toy, a slate and frame adjusted to revolve horizontally within an outer frame which is adjusted to revolve vertically between two standards, and which may be clamped in a horizontal, vertical, or inclined position, as required, all constructed substantially as shown, and for the purposes herein specified.

2. As a new article of manufacture, the slate-surface constructed and supported as shown, with the slate-surface and inner frame revolving horizontally in the outer frame, and the outer frame revolving vertically between the two supports, and with the spring-catches and clamp-screws, as shown, all the parts herein described constructed as shown, and working in combination, substantially as shown and described.

413,680. **NEEDLE-BAR FOR SEWING-MACHINES.** LEONARD W. PARKHURST, Hyde Park, Mass. Filed Apr. 1, 1889. Serial No. 305,698. (No model.)

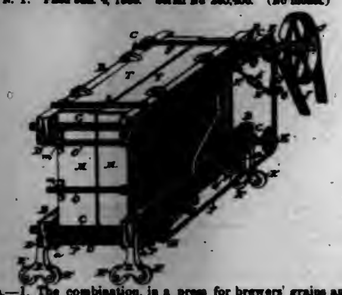
Claim.—A sewing-machine needle-bar consisting of two sections B C, the section B having the latch-lever b, with the catch b' under one end, the spiral spring b^2 under the other, and the pressure-piece b^4 over the spring, and the section C having the rabbet c and notch c', as shown and described.



413,681. **BUNG.** FRIEDRICH PFEIFER and LUDWIG MEISSER, Dusseldorf, Germany. Filed Feb. 27, 1889. Serial No. 301,368. (No model.)

Claim.—The combination of threaded plug K, having collar O, with elastic packing P and with suspended valve F and catch H, substantially as specified.

418,681.



418,682. PLOW-STOCK. JESSE L. POOLE, Martinsville, S. C., assignor of one-half to Pierce Y. Poole, same place. Filed May 16, 1888. Serial No. 211,003. (No model.)

Claim.—The combination, with a plow-beam and a bifurcated standard pivoted thereto, of a yoke adjustably clamped to said beam and connected by a nut, plate, and screw with the standard, the latter being supported rearwardly against the draft-strain by the yoke-clamp, as shown and described.

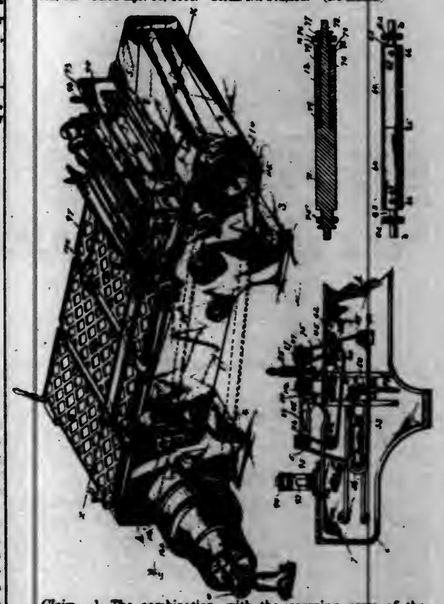
418,683. PRESS FOR EXTRACTING MOISTURE FROM BREWERS' GRAINS. WILLIAM P. PRESTON and JAMES J. KELLEY, Brooklyn, N. Y.; said Kelley assignor to said Preston and Frank J. Rudner, New York, N. Y. Filed Jan. 4, 1889. Serial No. 295,606. (No model.)

Claim.—1. The combination, in a press for brewers' grains and other materials, of the two parallel movable lateral walls, the transverse connecting-screws formed with right and left threads engaging nuts in the opposing walls and all geared together to rotate in unison, and the overlapping top, bottom, and end plates, substantially in the manner and for the purpose herein set forth.

2. The combination, with the two parallel movable lateral walls, the transverse right and left screws connecting and actuating them, and the overlapping top, bottom, and end plates, the bottom plates being hinged to said lateral walls, of the transverse sliding supporting-bars moving under the ends of the bottom plates, and the levers actuating said bars, substantially in the manner and for the purpose herein set forth.

3. The combination, with the parallel movable lateral walls, the transverse screws connecting and actuating them, the sprocket-wheels on the screw-shafts, and the endless chain gearing them together, of the swinging arms pivoted on one of the screw-shafts, the tension-rollers pivoted on the end of each arm to swing against the proximate length of the endless chain, the link connecting the free ends of said arms, and means for adjusting the length of said link, substantially in the manner and for the purpose herein set forth.

4. The combination, with the two parallel movable lateral walls, the transverse right and left screws connecting and actuating them, and the overlapping top, bottom, and end plates, of the transverse end-supporting bars, each secured to one of the lateral plates to work through an eye or staple on the opposite plate, substantially in the manner and for the purpose herein set forth.



418,684. ROTARY PUMP. FREDERICK G. SARGENT, Gardnerville, Nev. Filed July 25, 1887. Serial No. 245,194. (No model.)

Claim.—1. In a rotary pump, the combination of the separate radial buckets H H, the disks F G, rigidly attached thereto and provided with a central inlet-opening through one of them and a central bearing-step *f* upon the other, and the casing A, formed of the flanged box *a*, provided with a step-bearing and having its flange embracing both of said disks and fitted to the outer edges of the same with water-tight running joints, and the plate *a'*, carrying the induct-pipe B, substantially as described.

2. The combination of the disks F and G, having the separate radial buckets H H between them and each having a groove in its outer edge, and wire packing M, the step *f*, placed centrally upon the face of one of said disks, and the casing A, formed of the flanged box *a*, provided with a central step-bearing, and having its flange embracing both of said disks and fitted to the outer edges of the same with water-tight running joints, and the plate *a'*, carrying the induct-pipe B, substantially as described.

418,685. WOOD-WORKING MACHINE. SAMUEL J. REIMER, Milton, Pa. Filed Apr. 30, 1888. Serial No. 272,252. (No model.)

Claim.—1. The combination, with the carrying-arms of the matcher-head spindles, of a tubular shaft 21 and a setting-bar, as 29, arranged in the bore of the tubular shaft, and a bar to press the end of the setting-bar against the cross-piece of the frame at the forward part of the machine, substantially as described.

2. The combination, with the carrying-arms of the matcher-head spindles, of a tubular shaft 21 in bearings on the carrying-arms, a cross-piece 18, formed with a depending flange 27, having a groove 28 on its face, a setting-bar, as at 29, arranged in the bore of the tubular shaft with its inner end to engage the groove of the flange of the cross-piece, and a threaded bar in the end of the tubular shaft to set the setting-bar thereto, substantially as described.

3. In a planing-machine, the line-shaft having fixed pulleys, and loose pulleys of less diameter than said fixed pulleys, the carrying-arms having the depending spindle-brackets and the horizontal belt-rests 42, projecting therefrom, the vertical matcher-head spindles journaled in bearings in the carrying-arms and having the pulleys above the belt-rests, and the belts connecting the pulleys on the line-shafts with the pulleys on the matcher-head spindles, the lower edges of said belts traveling on the belt-rests, substantially as described.

4. The carrying-arms having the depending brackets, bearings in said brackets and in the front ends of the arms for the vertical matcher-head spindles, and the horizontal belt-rests 42, projected from the said depending brackets, for the purpose set forth, substantially as described.

5. The combination, with the driving-chain of the feed-rollers, the forward set of feed-rollers, and the upper and lower rear feed-rollers, of an idler, as 60, mounted on a bearing and carrying the chains free from the neck of the lower rear feed-roller, substantially as described.

6. The combination, with the upper feed-rollers and the lower feed-rollers and the driving-chain, of an idler mounted on the machine and arranged to carry the drive-chain free from the neck of one of the said lower feed-rollers, substantially as specified.

7. The combination, in a planing-machine, of the vertically-adjustable brackets having the planer-head mounted thereon, and a feed-roller journaled in arms on said brackets and consisting of two concentric parts of equal length, one part being free to revolve a limited distance on its bearing independent of the other, substantially as described.

8. The combination, in a planing-machine, of vertically-adjustable brackets having the planer-head mounted thereon, and a feed-roller journaled in arms formed on said brackets, consisting of a solid section of substantially one-half the length of the roller and having a shaft centrally projected from one end thereof, and a shell mounted to revolve on said projected shaft and formed with a sleeve constituting the journal end bearing of the shell, substantially as described.

9. The combination, in a planing-machine, of vertically-adjustable brackets having the planer-head mounted thereon, and a feed-roller consisting of a solid central part journaled in arms formed on said brackets, and a shell mounted concentrically on the solid central part and arranged thereon to have a limited independent revolution, substantially as described, and for the purpose specified.

10. The combination, in a planing-machine, of vertically-adjustable brackets carrying the planer-head, and a feed-roller consisting of a central shaft formed with journal ends mounted in said brackets and formed with stops 67, and a shell mounted on the said shaft and formed with limited angular slots 66, to engage the stops on the shaft, substantially as described, and for the purpose specified.

11. The combination, with a yielding driving-chain, of a feed-roller consisting of a solid central part and an outer shell mounted thereon and slotted to engage holding-pins on the solid central part, substantially as described.

12. In a planing-machine, the combination, with the driving means, substantially as described, of a feed-roller consisting of a central shaft and two shells of equal length mounted on the central shaft, each of said shells being slotted to engage stops fixed on the central shaft, substantially as described, and for the purpose specified.

13. The combination, with the feed-roller and the planer-head of a planing-machine, of a presser-bar consisting of sections 81 82, having sockets in their inner and approaching ends, and vertical screw-threaded end bars, and a connecting-bar arranged in the sockets of the sections, whereby they are supported at the middle, substantially as described.

14. The combination, in a planing-machine having the curved ways 84 in its inner side faces, of the presser-bar frame at the rear of the upper planer-head, a presser-bar having a curved face adjacent to the planer-head and consisting of two parts detachably united at their inner ends and formed with curved end flanges to fit the curved ways on the planer-frame, and threaded bolts to hold the presser-bar in place, whereby the pressure of the bar is thrown close to the planer-bits, substantially as described.

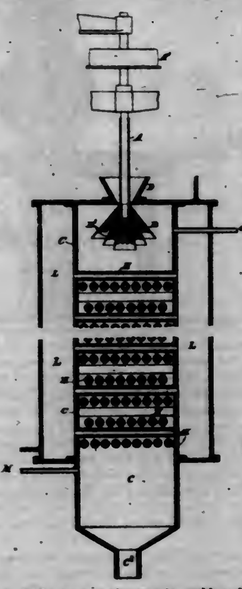
15. The combination, in a planing-machine, of the front presser-bar 87, formed with inclined tongues 92 on its ends, and the horizontal sliding brackets 90, formed with tongues 89 to slide in horizontal grooves in their support, and inclined grooves 91, to receive the tongues 92, whereby the presser-bar is both longitudinally and vertically adjustable, substantially as described.

16. The combination, with a planing-machine, of the chip-break and board-guide consisting of a metal bar adjustably arranged on the planer-bed and means for automatically imparting longitudinal and sidewise movements to the bar, substantially as described, and for the purpose specified.

17. The combination, with a planing-machine, of the chip-break and board-guide consisting of a bar having a threaded end and provided with slanting slots, a spring anchored on the bar to throw it longitudinally, and studs arranged to engage the slanting slots in said bar to throw the bar laterally, substantially as described.

18. The combination, with the bed of a planing-machine, of a chip-break and board-guide arranged on the bed of the machine and consisting of a metal bar having a head to set adjacent to the matcher-head of the machine, slanting slots to engage studs in the bed-plate and carrying-arm of the machine, and a spring on the bar to press it forward and sidewise, substantially as described, and for the purpose specified.

19. The combination, in a planing-machine, of a chip-break and board-guide 97, having a threaded end portion 98, a rounded-out chip end 110, and slanting slots 105 107, the housing 100, secured to the carrying-arm of the machine, the studs 106 109, arranged as specified, the spring 108, and the adjusting-nut 104, all substantially as described.



20. In a surface-planer of the kind herein described, the combination, with the driving-pulleys at the front of the machine, the upper and lower planer-heads provided with belt pulleys on their ends, and the driving-belts arranged thereon, of idler-pulleys 114, mounted on fixed shafts projected from the side of the machine-frame at the rear, said idlers 114 having the driving-belts arranged about them and being of such diameter as to carry the belt above and below the lower planer-head pulleys, substantially as described, and for the purpose specified.

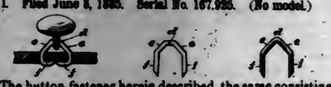
21. The combination, with the line-shaft of the machine, of the belt-housing idler-pulley 116, arranged adjacent to the driving-pulley 116^{x}, and formed with a wide circumferential flange 117 and a belt-supporting stud 118, whereby the belt of the machine may be rolled up and packed in the space within the flange, substantially as described.

22. The combination, with the line-shaft of the machine, of the belt-housing idler 116, arranged adjacent to the driving-pulley 116^{x} and formed with a wide circumferential flange 117 and a belt-supporting stud 118, and a cover 120 to close the side face of the idler, substantially as described, and for the purpose specified.

23. The combination, with the carrying-arm of the matcher-head and the belt driving the spindle of the matcher-head, of a belt-shifting bar having its upper end fixed to the side of the carrying-arm, with the bar extending downward to engage the said belt, substantially as described, and for the purpose specified.

418,686. PROCESS OF EXTRACTING GOLD OR SILVER BY CHLORINATION. JEAN B. A. SUBERBIE, Clermont-Ferrand, France, assignor to Samuel Wilkins Cragg, Baltimore, Md. Filed June 27, 1888. Serial No. 315,774. (No model.) Patented in England Apr. 9, 1888, No. 6,116.

Claim.—1. In the process of extracting gold or silver or gold and silver from their ores or materials containing them, the improvement which consists in first roasting or oxidizing the ores or materials and then subjecting them in a dry state to the action of dry gaseous chlorine, the chlorination being effected at a temperature of from 100° to 140° centigrade, as set forth.



2. In extracting gold or silver or gold and silver from their ores

or material containing them, the process consisting in grinding or reducing the ores or materials to be treated and separating the finer portions or dust from the coarser portions or granules, roasting or oxidizing them separately, and subjecting such finer and coarser portions separately to the action of dry gaseous chlorine, the chlorination being conducted at a temperature of from 100° to 140° centigrade.

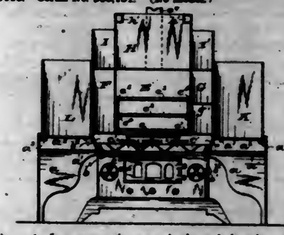
3. In the process of extracting gold or silver or gold and silver from their ores or materials containing them, the improvement consisting in subjecting said ores or materials in a dry state, after roasting or oxidizing, to the action of dry gaseous chlorine and maintaining the temperature at from 100° to 140° centigrade during chlorination by means of heated fluid—such as steam, air, or gas—surrounding the vessel in which the operation is carried on, as set forth.

4. In the process of separating gold or silver or gold and silver from their ores or materials containing the same, the improvement consisting in first roasting or oxidizing the reduced ores or materials and then showering the same in a dry condition through a chamber or column through which dry gaseous chlorine is passed in the opposite direction, the temperature being maintained during chlorination at from 100° to 140° centigrade, as set forth.

413,687. BUTTON-FASTENER. FRANKLIN A. SMITH, Jr., Providence, R. I. Filed June 3, 1885. Serial No. 167,925. (No model.)

Claim.—The button-fastener herein described, the same consisting of an angular crown or arch, for the reception of the eye of a button, and two parallel attaching-prongs having sharpened or attenuated points, said prongs being formed one at each end of said crown or arch and projecting downward therefrom, and being of substantially uniform size above the attenuated points as said crown or arch, substantially as herein set forth.

413,688. STAMPING OR DATING MACHINE. EDWARD F. SPIVEY and GEORGE W. SPIVEY, Flint, Tex. Filed Nov. 22, 1888. Serial No. 291,579. (No model.)



Claim.—1. The combination of the standards having the vertical longitudinal slots in their upper portions, the recessed guide secured horizontally to and between the standards, the cross-head playing in the slots of the standards, mechanism for reciprocating the cross-head, the stock pivoted to the cross-head and playing in the recessed guide, and the dating-wheels carried by said stock, as set forth.

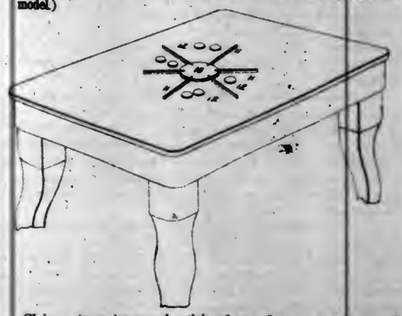
2. The combination of the standards having the vertical longitudinal slots in their upper portions, the recessed guide secured horizontally to and between the standards, the cross-head playing in the slots in the standards, mechanism for reciprocating said cross-head, the stock pivoted to the cross-head and playing in the recessed guide, the dating-wheels carried by said stock, and the buttons pivoted to said guide and projecting inward beyond the sides of the recess therein, as set forth.

3. The combination of the table, the standards rising therefrom, the rollers at the ends of the table, the stock mounted between the upper ends of the standards and carrying the dating-wheels, the driving-shaft journaled between the lower ends of the standards, connections between the ends of the driving-shaft and the stock, the roller secured on the driving-shaft, and the carrier-belt passing over the table and around the rollers, as set forth.

4. The carrying-belt for dating-machines having ink-pads secured to its upper surface at regular intervals, as set forth.

413,689. OIL-STOVE. JOHN STANARD, Newark, N. J. Filed Oct. 15, 1888. Serial No. 288,131. (No model.)

Claim.—1. In a stove, the stove-body and chambered frame above and around the same, combined with an ash-receiver and a pivoted flame-spreading device arranged above said ash-receiver, for the purposes set forth.



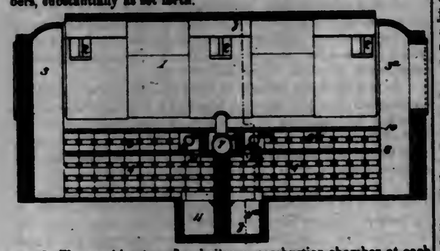
2. In a stove, the stove-body and chambered frame above and around the same, combined with an ash-receiver and a flame-spreading device pivotally arranged in the sides of the stove-frame, and having shields provided with rocker-arms connected with each other by a lever, one of said arms being provided with means for turning the same, a chambered compartment formed by the walls of the stove-body, in which said ash-receiver and flame-spreading device is arranged, compartments above the same, said compartments formed integrally with each other and arranged upon cleats secured to the walls of the stove-body, substantially as and for the purposes set forth.

3. The herein-described ash-receptacle, consisting of a frame *c*, provided with V-shaped bars *c'*, and openings or perforations c^2 in the bottom of said receptacle, in combination with a pivoted flame-spreading device, substantially as specified, and means for turning said device, for the purposes set forth.

4. The herein-described ash-receptacle, consisting of a frame *c*, provided with V-shaped bars or shields *c'*, arranged apart, with openings or perforations c^2 in the bottom of said receptacle, in combination with a flame-spreading device having shields *d* arranged above two of each of said V-shaped bars, said shields being pivotally arranged in the sides of the stove-frame, and means for turning said shields at an angle, consisting, essentially, of a rocker-arm attached to a shield, a lever connecting said arms, and a projection on one of said arms to receive a crank or key, for the purposes set forth.

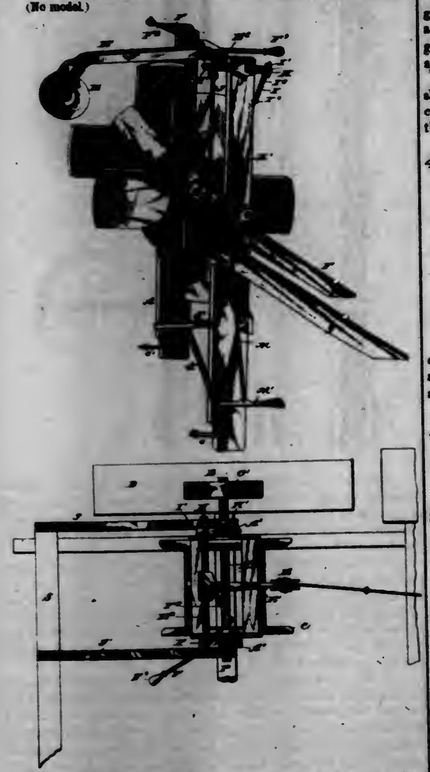
5. The herein-described flame-spreading device, consisting of shields *d*, pivotally arranged in the sides of the stove-frame, each shield being provided with a rocker-arm *d'*, said arms being connected with each other by a lever d^3, as specified, one of said rocker-arms having a square nut or projection d^3 thereon to receive a crank, for the purposes set forth.

413,690. GAME ATTACHMENT FOR TABLES. JOSEPH A. R. STUDWELL, Brooklyn, N. Y. Filed Jan. 24, 1889. Serial No. 297,365. (No model.)



Claim.—As an improved article of manufacture, a game attachment for tables, consisting of the plate or disk 10 and the radial arm 11, projecting from the periphery or sides of the disk or plate, as set forth.

413,691. REGENERATING-FURNACE FOR BOILERS. WILLIAM SWINDELL, Allegheny, Pa. Filed June 24, 1889. Serial No. 315,365. (No model.)



Claim.—1. The combination of a boiler, a combustion-chamber at each end of the boiler and extending along the boiler, and gas and air regenerative chambers located under each end of the boiler and connected to the combustion-chambers, substantially as set forth.

2. The combination of a boiler, a combustion-chamber at each end of the boiler and extending along the boiler, and gas and air regenerative chambers located under each end of the boiler and connected at their outer ends to the combustion-chambers, the gas-regenerative chambers being superposed on the air-regenerative chambers, substantially as set forth.

3. The combination of a boiler, a combustion-chamber at each end of the boiler and extending along the boiler, gas and air regenerative chambers located under each end of the boiler and connected to the combustion-chambers, and a flue provided with the valve for connecting the combustion-chambers, substantially as set forth.

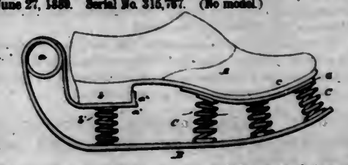
413,692. REEL FOR CHECK-ROW PLANTERS. FREDERICK THELINGERDEN, Mount Union, Iowa. Filed June 8, 1889. Serial No. 313,574. (No model.)

Claim.—1. In a check-row-planter reel attachment, a tension-regulating device consisting of the oscillating shaft E^2, the guide E thereon carrying the wheel E at one end, the oscillating lever H, connected with said shaft, the rod I, connected with one arm of said lever with one end attached to some fixed part of the machine, the spring I^2 on said rod beneath the outer end of said lever, and the nuts I' I^2 on said rod, substantially as specified.

2. In a check-row-planter attachment, the combination, with an upright, a lever F on said upright, and a horizontal link hinged thereto, of a shaft and a guide adapted to reciprocate freely upon said shaft and having one end of said link connected therewith, substantially as specified.

3. In a check-row-planter reel attachment, the combination, with a lever and a horizontal link hinged thereto, a guide, and a pulley journaled thereon, said guide being adapted to reciprocate freely upon a shaft journaled in two uprights, of a lever fastened to the end of said shaft and a tension-regulating device fastened to the upright and to the lever on said shaft, substantially as specified.

4. In a check-row-planter reel attachment, the combination, with the shaft E^2 and suitable supports therefor, the guide E, free to move longitudinally on said shaft, the pulley E at the free end of said guide, the lever F, the draw-link F^2, connecting said lever and guide, the lever H on the extended end of said shaft, and the rod I, adjustably connecting one end of said lever with the support, of the reel-shaft, the hook K, engaging the same, and the rod J, connecting the lever H with said hook, substantially as specified.



5. In a check-row-planter attachment, the combination, with the foot-lever M', draw-link M, and brake L, of the shaft B, friction-wheel C on said shaft, planter-wheel D, revolving in contact with said friction-wheel, reel C, hook K, engaging the shaft B, nut J^2, spring J', and rod J, substantially as specified.

6. In a check-row-planter reel attachment, the combination, with a guide mounted for oscillation at an angle to the reel, of connecting devices, substantially as described, extending from the guide to the reel-shaft and terminating in a hook supporting the shaft, and operating to raise said shaft by means of tension in the wire being reeled.

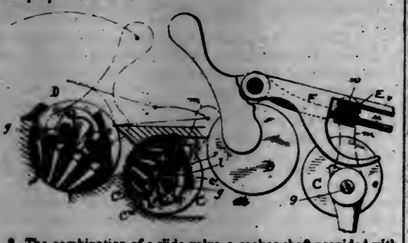
7. In a check-row-planter reel attachment, the combination of a guide mounted on the shaft and for oscillation at an angle to the reel, a lever secured to the guide-shaft to oscillate therewith and with the guide, and a rod extending from the lever and terminating in a hook arranged to embrace the reel-shaft, substantially as specified.

8. An oscillatory guide and its oscillating shaft provided with a slotted lever rigidly attached thereto, a connecting-rod adjustably secured in the slot of the lever and terminating in means for embracing the reel-shaft, substantially as specified.

413,693. SPRING-SHOE. JOHN S. WALKER, Claremont, N. H. Filed June 27, 1889. Serial No. 315,757. (No model.)

Claim.—A spring-shoe having a tread B extended from the toe of the boot or shoe back of the heel, provided with a posterior spring and a heel-seat all formed integral, in combination with a sole-plate and intermediate springs, as specified.

413,694. HAME-TUG. LEDRU R. WEBSTER, Holly, Mich. Filed July 1, 1889. Serial No. 316,236. (No model.)



Claim.—A hame-tug composed of a front section or loop provided with a hame-clip and a rear section hinged thereto at the front end and provided at the rear end with a suitable trace-buckle, said rear section comprising a bar of wood, a metallic strap sunk into the bar and bent around the ends thereof to form eyes for engaging the front end with the cross-bar of a link which hinges it to the front section and for engaging the shank of the trace-buckle at the rear end, rivets securing the metallic strap to the bar, loops secured in notches of the bar by the metallic strap, and a lining in each eye of said strap, all substantially as described.

413,695. VALVE SYSTEM FOR STEAM-ENGINES. JEROME WEBLOCK, Worcester, Mass. Filed Mar. 30, 1889. Serial No. 304,989. (No model.)

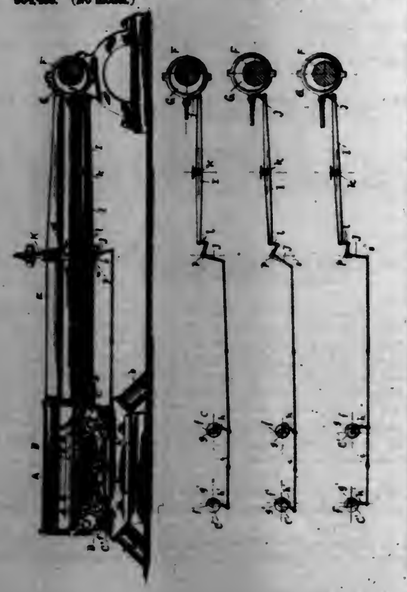
Claim.—1. The combination of a slide-valve with a removable seat, and a spring acting directly against said valve, whereby the valve

is closed upon the release of tripping mechanism, substantially as and for the purpose set forth.

2. The combination of a slide-valve, a rocker-shaft provided with a crank, and a link connecting said crank and link with a cam on said rock-shaft, whereby the motion of the slide-valve is checked, substantially as described.

3. The combination of a slide-valve and a spring acting directly against said valve with a positive stop to check the movement of said valve, said stop and spring being within the valve-casing, substantially as described.

4. The combination of a slide-valve, a rocker-shaft provided with a crank, and a link connecting said crank and link, with a tapering pin flattened upon one side firmly secured within the lugs of the valve and the bushings, substantially as and for the purpose set forth.



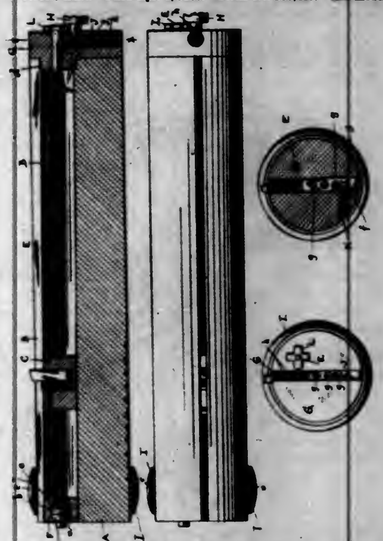
5. The combination of a slide-valve, a rocker-shaft provided with a crank, and a link connecting said crank and link, and a pin firmly secured within the lugs of the valve with a removable bushing, constructed substantially as described, and held upon said pin, as and for the purpose set forth.

6. In a slide-valve as above described, the combination of a link having tapering bushing with another bushing held stationary by means of a pin and the lug upon the valve, as described, and adapted to be removed therefrom, as and for the purpose set forth.

7. A latch-block with two holes through it at right angles, in combination with a bolt firmly fastened to the operating-arm of the cut-off valve, the block swiveling on said bolt when actuated by the link-bolt, substantially as shown and described.

8. The combination of a slide-valve, link, and rocker-arm with a crank the travel of which is on the side opposite the lugs on the valve, substantially down to a line passing through the rock-shaft and center of lugs, substantially as and for the purpose set forth.

413,696. MECHANISM FOR CONTROLLING CUT-OFF VALVES. JEROME WHEELOCK, Worcester, Mass. Filed Mar. 23, 1889. Serial No. 304,463. (No model.)



Claim.—1. In a valve-gear for controlling the cut-off valves of steam-engines, one or more trip-cams which complete one forward and backward movement during one revolution of the crank-shaft, means for operating the cams, and a governor for controlling the path of travel of said cams, substantially as and for the purpose set forth.

2. In a valve-gear for controlling the cut-off valves of engines, the combination of one or more trip-cams making a complete forward and backward movement during one revolution of the crank-shaft, with a governor whereby the path of such movement is controlled, substantially as and for the purpose set forth.

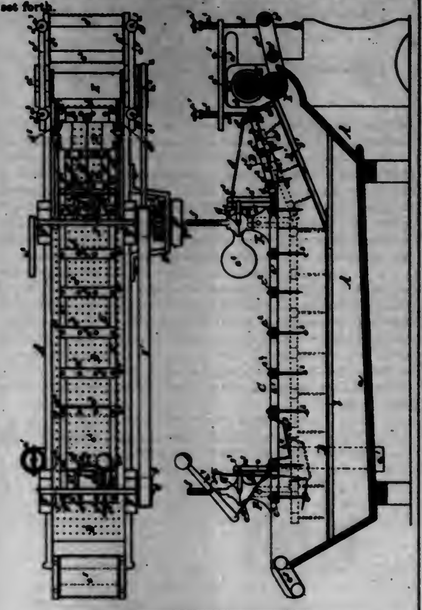
3. In a valve-gear for controlling the cut-off valves of engines, the combination of one or more trip-cams with means, substantially as described, for imparting to the trip-cams a complete forward and backward movement during one revolution of the crank-shaft, and a movable fulcrum controlled by the governor for controlling the path of travel of said cams, as and for the purpose set forth.

4. In a valve-gear for controlling the cut-off valves of engines, the combination of one or more trip-cams, an eccentric for imparting to the same a complete forward and backward movement during one revolution of the crank-shaft, and a governor whereby the path of such movement is controlled, substantially as and for the purpose specified.

413,697. METAL-BORING MACHINE. JEROME WHEELOCK, Worcester, Mass. Filed Apr. 3, 1889. Serial No. 306,415. (No model.)

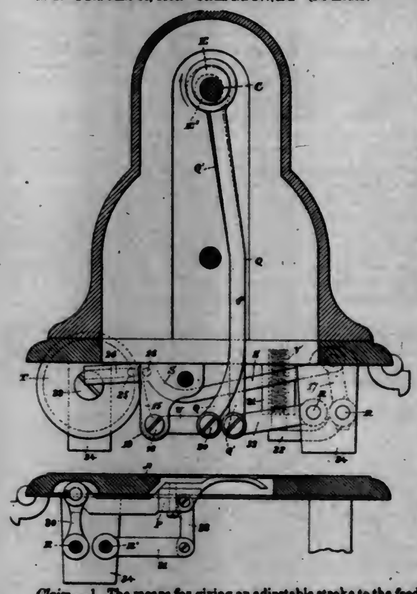
Claim.—1. The combination of a boring-bar having a tubular chamber the axis of which is at an angle with the axis of the bar, and a cutter-head adapted to slide within said chamber, with means, substantially as described, for imparting a sliding motion to said cutter-head, as and for the purpose set forth.

2. The combination of a boring-bar having a tubular chamber the axis of which is at an angle with the axis of the bar, a cutter-head sliding within said chamber, and means, substantially as described, for imparting a sliding movement to said cutter-head, with a supporting-screw near one end of said bar, whereby the angle between the chamber and the axis of the bore may be varied, substantially as and for the purpose set forth.



3. The combination of a boring-bar having a tubular chamber, a cutter-head sliding within said chamber, means, substantially as described, for imparting a sliding movement to said cutter-head, and a supporting-screw whereby the position of the axis of the chamber relatively to the axis of the bore may be varied, with a check-screw whereby said supporting-screw is secured and uniformly held in position relatively to the center which supports the bar, substantially as and for the purpose set forth.

413,698. WOOL-WASHING MACHINE. WILLIAM WEBB, Boston, N. H. Filed May 15, 1889. Serial No. 310,926. (No model.)

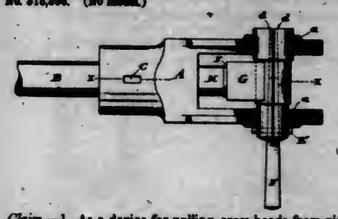


Claim.—1. In a wool-washing machine, the frame C, hung to parallel cranks g^2, in combination with balancing weighted levers c^2 and chain c^{10}, substantially as set forth.

2. In a wool-washing machine, the combination of the rake-frame

C, cranks g^2, hangers c, delivering-frame D, connected flexibly directly to the rake-frame C, and adjusting cord or chain c^9, substantially as set forth.

413,699. FEED MECHANISM FOR SEWING-MACHINES. CHAS. H. WILLCOX, New York, N. Y., and JAMES E. A. GIBBS, Rapidan, Va., assignors to the Willcox & Gibbs Sewing Machine Company, New York, N. Y. Filed June 18, 1888. Serial No. 277,454. (No model.)



Claim.—1. The means for giving an adjustable stroke to the feed-bar, consisting of the vibratory arm, the reciprocating piece or link provided with a projection in the path of said arm and adjustable lengthwise thereof, and the hand-actuated regulator or crank-disk mounted on the machine-frame and provided with a pin-and-groove joint between itself and said reciprocatory piece or link, in combination with the feed-advancing rock-shaft, the feed-bar, the feed-lifting rock-shaft, means for returning the feed-bar, and connections whereby motion is imparted from the main shaft to said feed-bar through said stroke-adjusting means and said rock-shafts, substantially as described.

2. The combination, with the feed-bar, means for returning said feed-bar, and the feed-advancing and feed-lifting rock-shafts connected with said feed-bar, of the lever having a vibratory arm, the reciprocatory piece or link connected with an arm of said feed-advancing rock-shaft, provided with a projection in the path of said vibratory arm and adjustable to shift said projection lengthwise of said arm, the hand-actuated regulator or crank-disk mounted on the machine-frame and provided with a pin-and-groove joint between itself and said reciprocatory piece or link, the connecting-rods jointed one to an arm of said lever and the other to an arm of said feed-lifting rock-shaft, and the eccentrics on the main shaft for said connecting-rods, substantially as described.

3. The means for giving an adjustable stroke to the feed-bar, consisting of the vibratory arm, the reciprocatory piece or link provided with a projection in the path of said arm and adjustable lengthwise thereof, and the hand-actuated regulator, having a portion extending through the machine-frame to the outside thereof and provided inside the said frame with a pin-and-groove joint between itself and said reciprocatory piece or link, in combination with the feed-advancing rock-shaft, the feed-bar, the feed-lifting rock-shaft, means for returning said feed-bar, and the connections whereby motion is imparted to said feed-bar from the main shaft through said stroke-adjusting means and said rock-shafts, substantially as described.

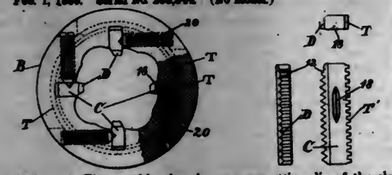
413,700. DEVICE FOR PULLING CROSS-HEADS FROM PISTON-RODS. JOHN W. WOOD, Sr., Altoona, Pa. Filed July 23, 1889. Serial No. 318,206. (No model.)

Claim.—1. As a device for pulling cross-heads from piston-rods, a segment adapted to rest in the connecting pin-hole and having a groove in its upper face to receive a wedge, in combination with a wedge adapted to rest in the groove of the segment, and a strut adapted to rest against the end of the piston-rod and directly or indirectly against the wedge, all substantially as and for the purpose specified.

2. As a device for pulling cross-heads from piston-rods, the tapered and internally-grooved segments D D′, in combination with a strut adapted to rest on one of said segments and against the piston-rod, and a wedge adapted to enter the grooves in segments D D′ and force them apart, all substantially as and for the purpose specified.

3. As a device for pulling cross-heads from piston-rods, the tapered and internally-grooved segments D D′, having keyways d' d' at their smaller ends, in combination with a key E, a strut adapted to rest on one of said segments and against the piston-rod, and a wedge adapted to enter the groove in segments D D′ and force them apart, all substantially as and for the purpose specified.

4. As a device for pulling cross-heads from piston-rods, the tapered and internally-grooved segments D D′, in combination with a strut adapted to rest on one of said segments and against the piston-rod, said strut having a point J, adapted to enter the center on said rod, and a wedge adapted to enter the grooves in segments D D′ and force them apart, all substantially as and for the purpose specified.



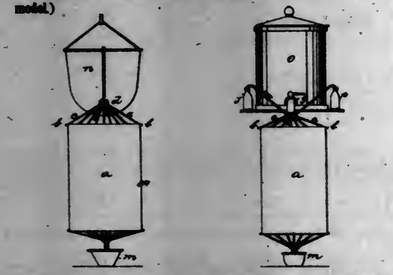
5. As a device for pulling cross-heads from piston-rods, the tapered and internally-grooved segments D D′, having on one face a groove d^3, in combination with a strut having a face grooved to fit on groove d^3 and adapted to rest on the segment and against the end of the piston-rod, and a wedge adapted to enter the grooves in segments D D′ and force them apart, all substantially as and for the purpose specified.

6. As a device for pulling cross-heads from piston-rods, the tapered and internally-grooved segments D D′, having on one face a groove d^3, in combination with a strut consisting of a block G, adapted to rest on the segments, and a bar H, having a point J, adapted to fit onto the block G and rest against the end of the piston-rod, all substantially as and for the purpose specified.

7. As a device for pulling cross-heads from piston-rods, the tapered and internally-grooved segments D D′, having on one face a groove d^3,

in combination with a strut consisting of a block G, adapted to rest on the segments, a bar H, having a point J, adapted to fit onto the block G and rest against the end of the piston-rod, and a washer adapted to fit between the block G and bar H, all substantially as and for the purpose specified.

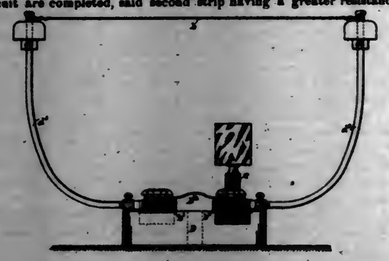
418,701. SCREW-CUTTING DIE. JAMES R. WOODBRIDGE, Hartford, Conn., assignor to The Pratt & Whitney Company, same place. Filed Feb. 1, 1889. Serial No. 298,344. (No model.)



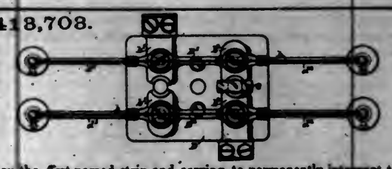
Claim.—1. The combination, in a screw-cutting die of the class described, of the annular collet having longitudinal slots and circumferentially spirally-distributed guide-notches formed on its inner face, and screw-cutting chasers seated in said slots and having notches engaging with said guide-notches, all substantially as described.

2. The improved screw-cutting die herein described, it consisting of a collet having slots on the inner surface thereof constructed to receive the chasers, and having spiral guide-notches on which to seat the chasers, and notched screw-cutting chasers seated in said slots, with their notches in engagement with said guide-notches, substantially as described.

3. The combination, with the collet B, slotted to receive the chasers and having the notches T, of the chasers C, constructed to be set in engagement with said notches, and means, substantially as described, holding said chasers in place, substantially as described.



418,702. EVAPORATOR FOR DISINFECTANTS, &c. JUSTUS O. WOODS, New York, N. Y. Filed Mar. 27, 1889. Serial No. 305,044. (No model.)



Claim.—The within-described apparatus for charging the air of apartments with vapors, consisting, essentially, of the absorbent apron, the cords attached thereto and converging to a central point in a knot or ring, and one or more reservoirs provided with pipes and regulating-valves arranged, substantially as shown and described, to discharge drops of fluid upon said central knot or ring, all combined and arranged to operate substantially as shown and described.

418,708. MULTIPLE THERMAL CUT-OUT. ALEXANDER WURTS, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed June 21, 1888. Serial No. 315,119. (No model.)

Claim.—1. An interrupting device for electric circuits, consisting of the combination, with a fusible strip, of a normally-closed shunt-circuit around the same, and a second fusible strip of conducting material through which the connections of said normally-closed shunt-circuit are completed, said second strip having a greater resistance

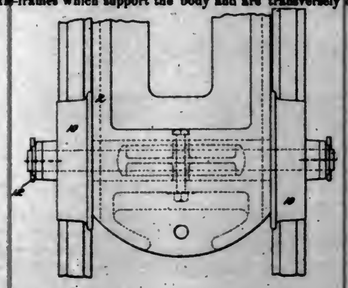
than the first-named strip and serving to permanently interrupt the shunt-circuit connections when the first-named fuse has been destroyed.

2. An interrupting device for electric circuits, consisting of the combination, with a fusible strip, of a normally-closed shunt-circuit around the same, and a second fusible strip of conducting material through which the connections of the said normally-closed shunt-circuit are completed, said second strip being of a different material from the first-named strip and serving to permanently interrupt the shunt-circuit connections when the first-named fuse has been destroyed.

3. An interrupting device for electric circuits, consisting of the combination, with an electric circuit, of a fusible strip, a normally-closed shunt-circuit, and a second fusible strip of conducting material through which the connections of the said normally-closed shunt-circuit are completed, said strips being so proportioned to each other and to the circuit that an abnormal increase of current in the circuit will destroy the first-named strip, while the second will be destroyed by the resultant current traversing its circuit, thereby permanently interrupting both circuits.

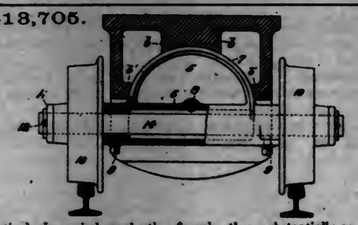
418,704. LAMP-BURNER. SAMUEL ADAMS, Chicago, Ill. Filed July 5, 1889. Serial No. 316,542. (No model.)

Claim.—1. The combination, with the wick-tube and the wick-adjusting wheels, of projections which extend into the wick-tube below said wheels and contract the tube, whereby the wick is prevented from dropping out of reach of the wheels in turning it down, substantially as set forth.



2. The combination, with the wick-tube having slots in one of its walls for the wick-adjusting wheels and the wick-adjusting wheels projecting into the wick-tube through these slots, of projections formed on the opposite wall of the wick-tube and extending into the wick-tube below said wheels, substantially as set forth.

3. The combination, with the wick-tube having slots in one of its walls for the wick-adjusting wheels and the wick-adjusting wheels projecting into the wick-tube through these slots, of a projection formed on the slotted wall of the wick-tube, whereby the wick is held away from the slots, substantially as set forth.



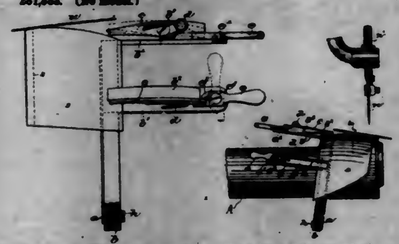
4. The combination, with the wick-tube having slots in one of its walls for the wick-adjusting wheels and the wick-adjusting wheels projecting into the tube through these slots, of a projection formed on the slotted wall of the wick-tube, whereby the wick is held away from the slots, and projections formed on the opposite wall of the wick-tube below the wheels, whereby the wick is held in reach of the wheels when turned down, substantially as set forth.

418,705. CAR OR TRUCK. HENRY AIKEN, Homestead, Pa. Filed Nov. 2, 1885. Renewed Aug. 3, 1889. Serial No. 319,631. (No model.)

Claim.—1. In a car or truck, the combination, with the body, of axle-frames which support the body and are transversely oscillatory

418,705.

in vertical planes independently of each other, substantially as and for the purposes described.



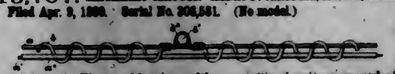
2. In a truck or car, the combination, with the body, of a transverse axle-frame on which the body is supported, said frame having bearings on a circular arc against the body and being oscillatory transversely in said bearings, substantially as and for the purposes described.

3. In a truck or car, the combination, with the body, of a transverse axle-frame on which the body is supported, said frame having a periphery made in circular arc curved transversely and having bearings against the body in which it is oscillatory, substantially as and for the purposes described.

4. In a truck or car, the combination, with the body, of a transverse axle-frame on which the body is supported, said frame being set in a vertical transverse recess formed in the truck-body, having bearings against the body and being oscillatory transversely in said bearings, substantially as and for the purposes described.

5. In a truck or car, the combination, with the body, of a transverse axle-frame on which the body is supported, said frame being set in a vertical transverse recess formed in the truck-body, having bearings therein against the body and being oscillatory transversely in said bearings, and a pin connecting the frame and body at the center of each oscillation, substantially as and for the purposes described.

418,706. COUNTER-HOLDER FOR SHOE-SEWING MACHINES. JONATHAN BARRETT, Malvern, Mass. Filed July 30, 1888. Serial No. 281,382. (No model.)

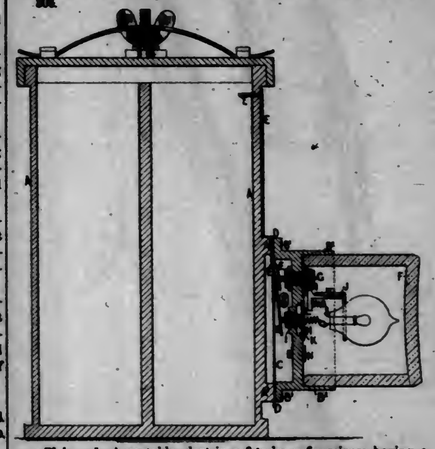


Claim.—1. The carrier and its circumferentially-attached arms b', having uprights b^2 thereon, combined with the spring fingers or jaws c, pivoted upon said uprights, and cam-levers e, having beveled portions e^2 to act upon the end of the fingers against the action of the springs, substantially as described.

2. The carrier and its arms b', projecting therefrom at substantially right angles, combined with the pivoted fingers or jaws c upon said arms, and with springs adapted to normally elevate said fingers, and with cams to move the said fingers into operative position against the action of said springs, substantially as described.

3. The race or support and the carrier movable thereon, combined with pivoted clamps attached to and projecting from the said carrier, the inner ends of the clamps being extended over the periphery of the carrier, substantially as described.

418,707. METALLIC CIRCUIT. HENRY F. CAMPBELL, Malden, Mass. Filed Apr. 9, 1888. Serial No. 306,581. (No model.)

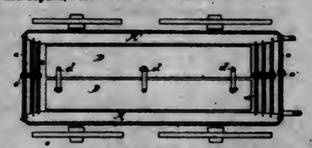


Claim.—1. The combination, with a metallic circuit composed of two branches or wires a a', of a separator b, of textile material, wound about and between the said branches throughout the length of the circuit to separate and yet bind the said branches, the said separator obviating short-circuiting of the metallic circuit, substantially as described.

2. The combination, with a metallic circuit composed of two branches or wires a a', the branch a' being an insulated conductor and the branch a a bare wire or indifferently-insulated conductor, of a separator b, of textile material, wound about and between the said branches throughout the length of the circuit to separate and yet bind the said branches, substantially as described.

3. The combination, with a metallic circuit consisting of branches composed of independent wires, of a separator b, of textile material, wound about the said branches to bind and yet separate the same, an insulator, and a wire b^3, wound about said insulator and one wire of the circuit only, substantially as described.

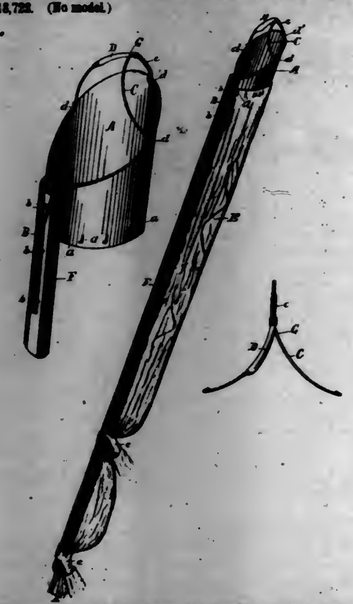
418,708. ELECTRIC SAFETY-LAMP FOR MINERS. THOMPSON COAD, Forest Gate, County of Essex, England. Filed May 21, 1888. Serial No. 311,536. (No model.) Patented in England Jan. 5, 1884, No. 206.



Claim.—1. A portable electric safety-lamp for miners, having a battery, an incandescent lamp suitably connected thereto within an air-tight glass envelope, a passage for the introduction of air into glass envelope, arranged to be closed, and a movable contact-point arranged to complete the circuit on depression, normally held out of circuit by spring appliance, having one of the connections for the lamp attached to a flexible diaphragm within the glass envelope operated by a pressure of air to depress the movable contact-point to complete the circuit, all substantially as described and set forth.

2. In a portable electric safety-lamp for miners, having a battery, an incandescent lamp suitably connected thereto within an air-tight glass envelope, a passage for the introduction of air into glass envelope, arranged to be closed, and a flexible diaphragm within the glass envelope, arranged to be depressed by a pressure of air within the glass envelope, in combination with a movable contact-point arranged under flexible diaphragm, capable of depression by the diaphragm to complete the circuit, normally held out of circuit by spring appliance, and having one of the connections for the lamp attached, substantially as described and set forth.

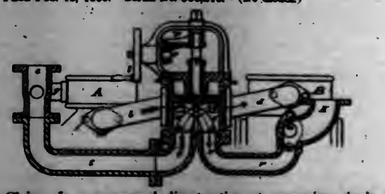
3. In a portable electric safety-lamp for miners, having a battery, an incandescent lamp suitably connected thereto within an air-tight glass envelope, a passage for the introduction of air into glass envelope, arranged to be closed, and a movable contact-point arranged to complete the circuit on depression, normally held out of circuit by spring appliance and having one of the connections for the lamp attached, in combination with a flexible diaphragm within the glass envelope capable of depression by a pressure of air with the envelope to operate a movable contact-point, substantially as described and set forth.



418,709. PERAMBULATOR. HENRY CORNISH, New York, N. Y. Filed Sept. 4, 1889. Serial No. 322,941. (No model.)

Claim.—In a perambulator, the combination, with the sides of the carriage-body, of a bottom piece hinged thereto and adapted to fold to the said sides, hinged links pivoted to the ends of the body-sides, whereby the said sides may fold to each other flatwise, and side

bars carrying the axle-trees united by cross-pieces pivoted to one side bar and detachably connected to the other side bar, substantially as and for the purpose set forth.

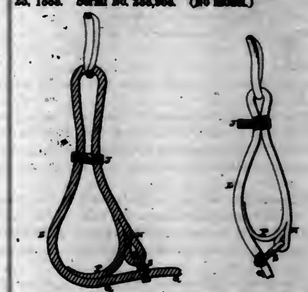


418,710. FRUIT-GATHERER. James M. Davenport and Benjamin F. Mitchell, Centreview, Mo. Filed July 26, 1889. Serial No. 318,722. (No model.)

Claim.—1. In a fruit-gatherer, the handle carrying at its upper end a scoop-shaped head, said head being provided with an upwardly-projecting frame C, formed with three prongs or branches, each of which is secured to the head, and a separate knife or blade attached to one of said prongs or branches, in combination with the chute E, substantially as described.

2. In a fruit-gatherer, the head having an inclined upper end, to which is secured an upwardly-projecting frame of twisted wire formed with three prongs or branches, one of which has a knife or blade riveted thereto, the lower end of said head being provided with hooks adapted to receive a chute E, in combination with a handle F, substantially as described.

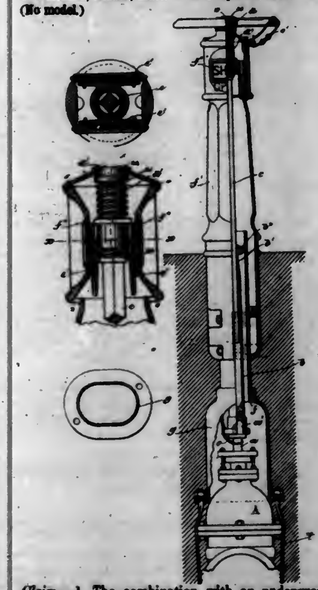
418,711. STEAM-ENGINE. Charles P. Deane, Springfield, Mass. Filed Feb. 18, 1889. Serial No. 300,218. (No model.)



Claim.—In a compound direct-acting steam-engine, single or duplex, the cylindrical rotary switching-valve *c*, constructed as shown and described, and having its chambers *v s* and its interior passages *w i* arranged as shown with reference to the ports or openings in its shell *a* to and from the pipes *b*, *d*, *t*, and *r*, all substantially as and for the purpose described.

418,712. CORN-PLANER. Jules De Rose, San Francisco, Cal., assignor to Moses Cohn, New Orleans, La. Filed Apr. 24, 1889. Serial No. 308,470. (No model.)

Claim.—In corn-planing machines, the corn-planer composed of the frame B', with face-plate B, having the throat D, the revolving bit-stock F, having the bit or cutter G, the journal N, and crank J, in combination with the outside frame A, having the journal-slots K, the adjustable bearings H, and set-screws I.



418,718. THILL-TUG. John Fehrer, Louisville, Ky. Filed Oct. 23, 1888. Serial No. 288,988. (No model.)

Claim.—1. In a shaft-tug, the combination of the buckle for securing it to the saddle, a single strap L, which passes through the buckle and is doubled upon itself, a keeper which incloses the strap below the buckle, and a fastening or buckle applied to one end of the strap, and through which the opposite free end Q of the strap passes, substantially as described.

2. In a shaft-tug, the combination of the buckle for securing it to the saddle, the strap L, which passes through and is doubled upon itself, one end of the strap being bifurcated and provided with the extension P for the purpose described, and a fastening S, secured to said bifurcated end, to which the opposite free end of the strap is detachably secured, substantially as shown and described.

418,714. VALVE OPERATING AND INDICATING POST. John R. Freeman, Boston, Mass. Filed Apr. 23, 1889. Serial No. 308,318. (No model.)

Claim.—1. The combination, with an underground valve, of a case for the valve-operating stem, said case comprising two or more parts jointed telescopically and having the clamping-plate f^* and bolts f^3, substantially as described.

2. A valve and valve-stem or extension thereof bearing a screw-threaded portion *d'*, combined with an inclosing-case for the valve-stem, having transparent windows or openings through it, and a tell-tale or indicator, as *e e'*, placed upon the screw-threaded portion *d'* of said valve-stem and movable longitudinally thereon back of the said openings, whereby the location of the valve may be indicated, substantially as described.

3. The valve placed beneath the surface of the ground and having an extended valve-stem, and an indicator moved by said valve-stem, combined with the inclosing-case for the valve-stem, rising above the surface of the ground and having openings through it for showing the tell-tale, substantially as described.

4. A valve and valve-stem and indicator moved by said valve-stem, combined with the inclosing-case consisting of the tubular portion *f* and the tubular portion *f'*, clamped thereon and having one or more transparent windows or openings, back of which the tell-tale or indicator is moved, substantially as described.

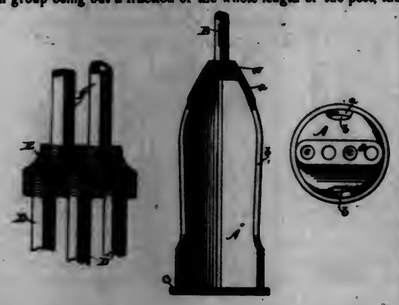
5. The valve, valve-stem, and tell-tale or indicator moved by the valve-stem directly or indirectly, combined with an inclosing-case having transparent portions, through which the indicator is visible, and vent-holes for preventing the accumulation of moisture thereon, substantially as described.

6. A valve and valve-stem and indicator or tell-tale moved by it, and an inclosing-case, combined with the removable cash-box, back of which the indicator moves, substantially as described.

7. A valve and valve-stem and the removable screw-threaded portion *d'*, combined with the indicator comprising the removable interiorly-screw-threaded collar *e* and the side plate or plates *e'*, substantially as described.

8. A valve and valve-stem and indicator bearing words indicating the location of the valve moved directly or indirectly by said stem, combined with an inclosing-case having portions through which the indicator is visible, substantially as described.

418,715. PORTABLE DARK-ROOM. Isaac W. Gibson, Woodbury, N. J. Filed Apr. 27, 1887. Serial No. 236,230. (No model.)

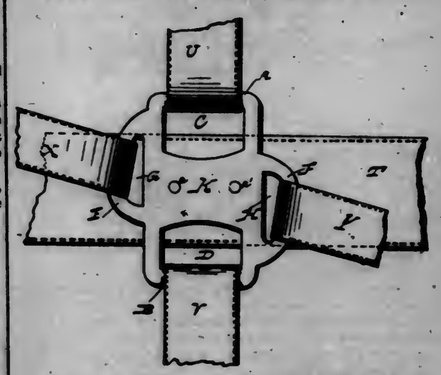


Claim.—1. A portable dark-room for photographers' uses, consisting of a flexible light-excluding hood or mantle for receiving and closely enveloping the head and arms of the user, a floor at the bottom of said hood, and the whole adapted to be pendent from and supported by the upper portion of the body of the user, substantially as described.

2. In a portable dark-room, the combination, substantially as hereinbefore described, of a flexible light-excluding hood or mantle for closely enveloping the head and arms of the user, and a folding floor-frame at the bottom of said hood, whereby, when not in use, the room can be folded and made into a package convenient for transportation.

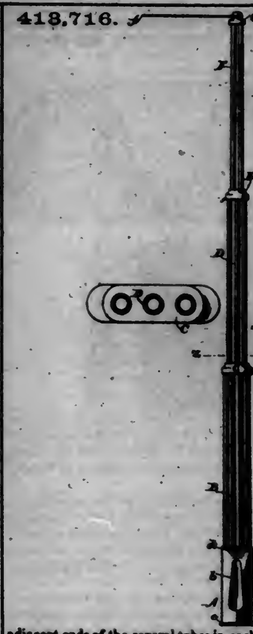
418,716. METAL POST. Orson B. Hall, Malden, Mass. Filed July 18, 1889. Serial No. 317,903. (No model.)

Claim.—1. A metal post formed of tubes or rods arranged in groups, each group being but a portion of the whole height of the post, and having interposed between the meeting ends of adjacent groups a single solid coupling in which each and all of said ends are separately and independently secured, substantially as specified.



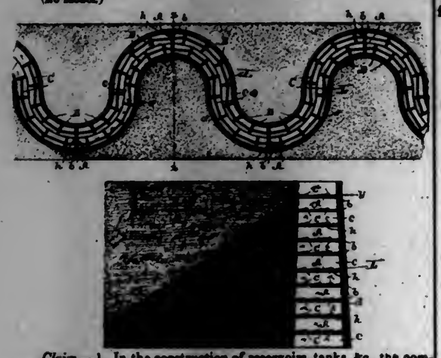
2. A metal post formed of iron tubes or rods arranged in groups, each group being but a fraction of the whole length of the post, the adjacent ends of the several tubes in each group being screw-threaded in the same coupling, and the axes of the several tubes being in a common plane, substantially as specified.

3. A metal post formed of tubes or rods arranged in groups, each group being but a fraction of the whole height of the post, the number of tubes in the several groups being diminished from the lowest upward, and the adjacent ends of the several tubes in each group being screw-threaded in the same coupling, substantially as specified.



4. A metal post formed with base A, groups of tubes, as B D F, diminished in number, in groups, one above the other, couplings, as C E, between the meeting ends of the groups, and a cap, as G, all said pipes at the respective ends of each group being rigidly secured in the same coupling or holder, substantially as specified.

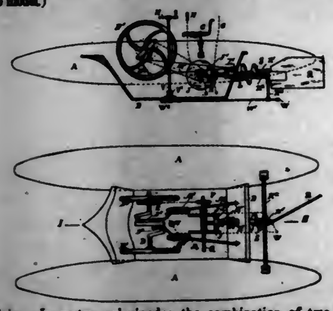
418,717. HARNESS-LOOP. James K. Hamilton, Brookville, Pa. Filed Mar. 19, 1889. Serial No. 303,986. (No model.)



Claim.—The within-described improved article of manufacture, consisting of the plate K, constructed with the upper and lower loops C D and side loops formed integral and having the perforations, said plate having a flat back and inwardly-curved ends, and the side loops extending outwardly, the bars E F of which incline in opposite directions and adapted to receive, respectively, the breeching-strap and yoke-strap, all as and for the purpose set forth.

418,716.

418,718. CONSTRUCTION OF RETAINING-WALLS. WILLIAM H. HARRELSON, Kansas City, Mo. Filed June 20, 1889. Serial No. 316,061. (No model.)

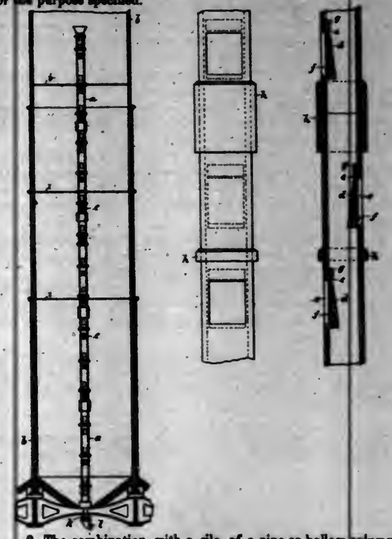


Claim.—1. In the construction of reservoirs, tanks, &c., the combination, with the constituent parts of the wall of the structure, of notched hooks embedded in the wall at intervals, and the bands placed longitudinally in the wall to engage the notches in said hooks, substantially as specified.

2. In the construction of reservoirs, tanks, &c., the combination, with the constituent parts of the wall, of notched hooks arranged in vertical series and embedded in the wall and placed transversely to the length of the same, and the bands embedded in the wall in the planes of said hooks and placed to engage the notches therein, substantially as specified.

3. In the construction of reservoirs, tanks, &c., the combination, with the constituent parts of the wall, of notched hooks arranged at the salient points of the wall and provided with lateral wings to bear against the outer or convex surface of the same, and the bands embedded in the wall and placed to engage the notches of the said hooks, substantially as specified.

4. In the construction of reservoirs, tanks, &c., the combination, with the constituent parts of the wall, of the pins or nails embedded therein in horizontal series, the wires or bands placed to engage the projecting ends of said pins or nails, and the notched hooks arranged at the salient points of the wall and engaging the said wires or bands, said hooks being provided with lateral wings to bear on the surface of the wall, substantially as and for the purpose specified.

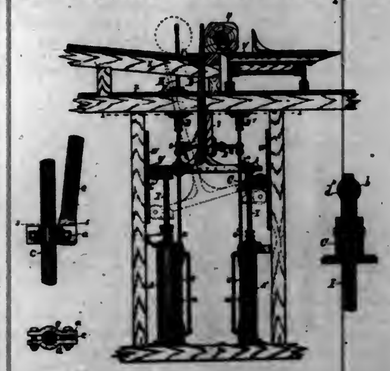


418,719. WATER-VELOCIPEDE. GEORG HEINZE, Klotzsche, near Dresden, Saxony, Germany. Filed Apr. 3, 1889. Serial No. 306,306. (No model.)

Claim.—In water-velocipedes, the combination of two lateral floats A A, a central connecting dry-well B, a rudder behind the rear of said dry-well, a cross-bar W below said rudder, a spindle V, passing through a stuffing-box in the floor of said dry-well, a cross-bar W^2 on the lower end thereof, and rods W', connecting said cross-bars W W^2, for the purpose set forth.

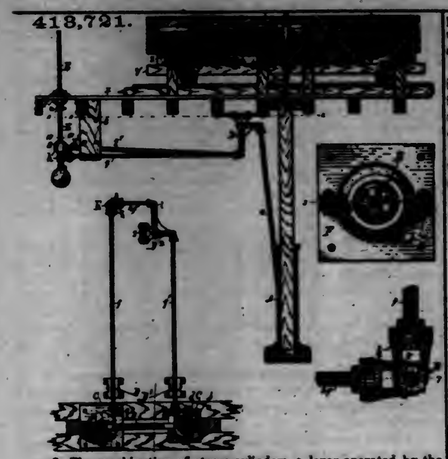
418,720. APPARATUS FOR DRAWING OFF GRAIN FROM SILOS. GEORGE HEPWORTH, Liverpool, County of Lancaster, England. Filed Feb. 20, 1888. Serial No. 265,763. (No model.) Patented in England Mar. 3, 1888, No. 3,081.

Claim.—1. In apparatus for drawing off grain from silos or other like places, the combination of the silo *b* with a pipe or hollow column *a*, extending from or near the top of a single silo *b* to the bottom thereof, and having openings *c* formed on its entire length at suitable intervals, through which the grain enters the pipe or hollow column *a* automatically, and is drawn off from the silo *b*, substantially as and for the purpose specified.



2. The combination, with a silo, of a pipe or hollow column extending from a higher to a lower point within the silo and having apertures at different heights, and inwardly-opening valves for opening or closing said apertures, substantially as set forth.

3. The combination, with a silo, of a pipe or hollow column extending from a higher to a lower point within the same and having apertures at different heights opening into the same silo, and valves situated at said apertures for preventing or permitting the ingress of grain, substantially as set forth.

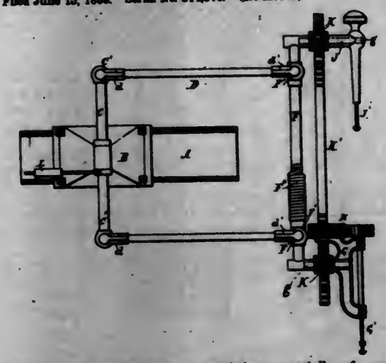


418,721. LOG-LOADER. WILLIAM R. HILL, Kalamazoo, Mich. Filed Aug. 12, 1889. Serial No. 320,505. (No model.)

Claim.—1. In a log-loading machine, the combination of two upright stationary steam-cylinders, the lever having the oppositely-extended arms at the base, the end of one of said arms being pivoted to the piston-rod of one of the cylinders, and the end of the other arm having both a pivoted and a sliding attachment to the piston-rod of the other cylinder, substantially as set forth.

2. In a log-loading machine, the combination of the steam-cylinders fixed in a stationary or rigid position, the lever having oppositely-extending arms at the base, a bracket attached to the end of each piston-rod of said cylinders, one arm of said lever being pivoted to one of the brackets, a thimble through which the end of the other arm reciprocates, said thimble being pivoted to the other bracket, and guideways traversed by said brackets, substantially as set forth.

418,721.

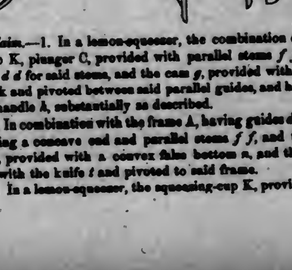


3. The combination of steam-cylinders, a lever operated by the piston-rods of said cylinders, an operating-lever having a ball-and-socket fulcrum, and suitable rods and cranks connecting the operating-lever with the valve-rods of steam-cylinders, whereby the valves of each cylinder are operated by the single lever, substantially in the manner set forth.

4. The combination of the upright steam-cylinders and piston-rods, a lever operated by said pistons, an operating-lever having a ball-and-socket fulcrum, the bell-cranks above the cylinders, the valve-rods pivoted to said bell-cranks, the operating-lever having the ball-and-socket fulcrum, a rod pivoted at one end to a coupling and said coupling attached in a swiveled manner to one of the bell-cranks, the other end of said rod being swiveled to a coupling, two collars loose on the operating-lever, so as to turn, the latter-named coupling being pivoted to one of said collars, a short rod swiveled to a coupling and said coupling being pivoted to the other collar, a bell-crank to which the other end of the short rod is pivoted indirectly by a coupling, said coupling being swiveled to the latter bell-crank, and a rod pivoted at one end to said bell-crank and at the other end to the other of the bell-cranks over the cylinder, substantially as set forth.

5. In a log-loader employing the steam-cylinders, an operating-lever fulcrumed to tilt in any direction, and jointed by connected rods and cranks between said lever and the valve-rods of the cylinders, all arranged and combined to cause the actions of the valves, substantially as set forth.

418,722. CARVING-MACHINE. HORACE HOLMES, Detroit, Mich. Filed June 15, 1889. Serial No. 314,370. (No model.)

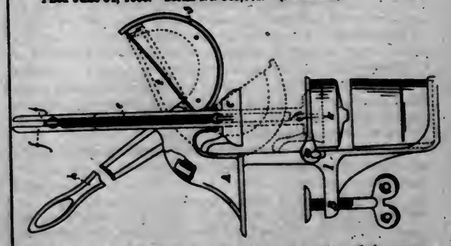


Claim.—1. A carving-machine consisting, essentially, of a carriage, a guide bed or ways along which it is designed to traverse, a horizontal shaft mounted transversely across said carriage, with arms pivotally engaged therewith and adapted to swing horizontally, a horizontal shaft journaled through pivoted bearings at the outer ends of said arms, a tool-support engaged with said latter shaft adapted to move up and down about the axis of the shaft, a tool engaged with a pivot in said support at right angles with the said shaft, and an electric motor engaged with and adapted to rotate the tool, substantially as and for the purposes described.

2. The combination, with the tool and the mechanism whereby it is engaged with the traveling carriage, of the guide-point J', pivoted in like manner as the tool, the gears K, and rack-bars K', whereby the movements of the guide are reproduced by the tool, substantially as described.

3. The combination, with the tool, the traveling carriage, and the intermediate connecting apparatus, of a counterpoise-weight L and spring F^9, substantially as described.

418,723. PULLEY. PETER JENSEN, Menasha, Wis. Filed July 16, 1889. Serial No. 317,663. (No model.)



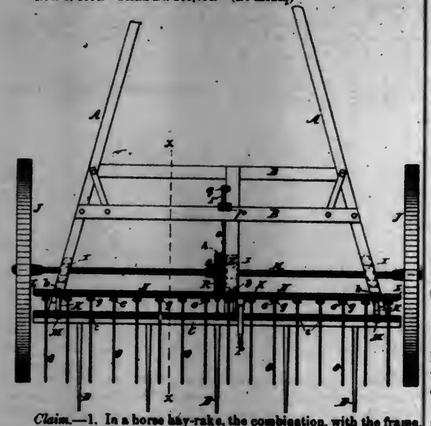
Claim.—The combination, in a separable pulley, of a hub divided longitudinally of its bore and comprising two similar sections, having bosses formed thereon for receiving bolts for clamping the sections together and sockets within their bore adapted to receive a nut, each section having a pulley-arm cast integral therewith and one or more detachable arms inserted therein, said detachable arms each having near its inner end and outside of the hub-section a collar or nut and upon its extreme inner end and within the socket aforesaid a nut securing the arm and hub-section together, and the outer ends of the pulley-arms being provided with ears adapted to and receiving semi-circular pulley-rim sections, and means, substantially as shown, for securing the arms to the pulley-rim sections and to each other, and the clamp-bolts 8, for securing the hub-sections together and clamping them upon a shaft, substantially as described.

418,724. BROWN DYE. HENRY D. KENDALL, Lowell, Mass. Filed May 24, 1889. Serial No. 311,996. (Specimens.)

Claim.—1. The herein described fast brown coloring-matter produced from dinitroso-resorcin and its homologues, and having the property of being soluble in water and alcohol and substantially insoluble in benzine, and of being fast to light, air, soap, &c., when fixed upon fabrics, substantially as described.

2. The process of making a fast brown coloring-matter from coal-tar products, which is soluble in water and alcohol and substantially insoluble in benzine, by treating dinitroso-resorcin or its homologues with a hydrosulphite, substantially as described.

418,725. LEMON-SQUEEZER. NATHAN LEVY, Auburn, N. Y. Filed June 21, 1889. Serial No. 315,062. (No model.)



Claim.—1. In a lemon-squeezer, the combination of the squeezing-cup K, plunger C, provided with parallel stems *f f*, the parallel guides *d d* for said stems, and the cam *g*, provided with the knife *t* at its back and pivoted between said parallel guides, and having an actuating handle A, substantially as described.

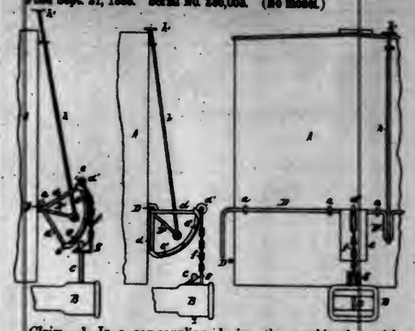
2. In combination with the frame A, having guides *d d*, the plunger C, having a concave end and parallel stems *f f*, and the squeezing-cup K, provided with a convex false bottom *n*, and the cam *g*, provided with the knife *t* and pivoted to said frame.

3. In a lemon-squeezer, the squeezing-cup K, provided with guid-

ing-lugs *s s*, rods *p p*, springs *r r*, and glass-supporting ring at the lower extremities of said rods, in combination with a plunger C and actuating-cam *g*.

413,726. HORSE HAY-RAKE. PETER R. LITTLE, Dayton, Ohio, assignor to the Stoddard Manufacturing Company, same place. Filed Nov. 2, 1888. Serial No. 289,706. (No model.)

Claim.—1. In a horse hay-rake, the combination, with the frame, carrying-wheels, tilting rake-head mounted on said frame, and revolving axle, of a ratchet fast upon said axle, a lifting-wheel loose upon said axle by the side of said ratchet and connected to the tilting rake-head, a locking-dog carried upon the lifting-wheel, with means for causing the engagement with and disengagement from the ratchet-wheel, and a locking-bolt mounted on the frame, arranged to engage with said locking-dog when the latter is disengaged from the ratchet-wheel and to be disengaged from the locking-dog upon the engagement of the latter with the ratchet-wheel, substantially as and for the purpose described.



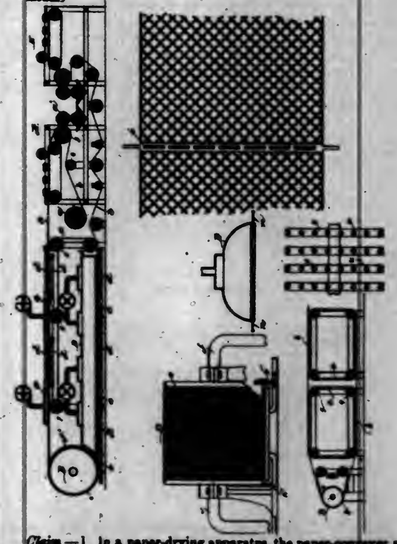
2. In a horse hay-rake, the combination, with the frame, carrying-wheels, tilting rake-head, and revolving axle, of a ratchet fast upon said axle, a lifting-wheel loose upon said axle by the side of said ratchet, a locking-dog carried upon the lifting-wheel, means for causing its engagement with and disengagement from the ratchet-wheel, a locking-bolt mounted on the frame and adapted to lock the lifting-wheel when the latter is disengaged from the ratchet-wheel and to release the lifting-wheel when the latter is locked to the ratchet-wheel, and chains secured at one end to the lifting-wheel and connected at the other to the tilting rake-head on opposite sides of the pivotal point of said rake-head, substantially as and for the purpose described.

3. In a horse hay-rake, the combination, with the frame, carrying-wheels, tilting rake-head, and revolving axle, of a ratchet fast upon said axle, a lifting-wheel loose upon said axle by the side of said ratchet, a locking-dog carried upon the lifting-wheel, means for causing its engagement with and disengagement from the ratchet-wheel, a locking-bolt mounted on the frame and adapted to engage with said locking-dog when the latter is disengaged from the ratchet-wheel and to be disengaged from the locking-dog upon the engagement of the latter with the ratchet-wheel, and chains or links secured at one end to the lifting-wheel and connected at the other to the tilting rake-head on opposite sides of the pivotal point of said rake-head, substantially as and for the purpose described.

4. In a horse hay-rake, the combination, with the frame, carrying-wheels, tilting rake-head, and revolving axle, of the ratchet-wheel Q, fast upon the revolving axle, the lifting-wheel R, loose upon said axle by the side of said ratchet-wheel, the locking-dog S, carried by the lever T on the wheel R, the chain A, connecting the lifting-wheel R to the rake-head, the chain or links *o*, for moving the dog S into engagement with the ratchet-wheel Q, and the plate *s*, mounted on the frame for disengaging the dog S from the ratchet-wheel Q, substantially as and for the purpose described.

5. In a horse hay-rake, the combination, with the frame, carrying-wheels, tilting rake-head, and revolving axle, of the ratchet-wheel Q, lifting-wheel R, locking-dog S, carried by the lever T on the wheel R, the links *o*, plate *s*, locking-bolt U, mounted on the frame, and chains A and links *n*, connecting the lifting-wheel R to the rake-head on opposite sides of its pivotal support, substantially as and for the purpose described.

413,727. CAR-COUPLING. PATRICK MCBRYDE, Montgomery, Minn. Filed Sept. 21, 1888. Serial No. 286,052. (No model.)



Claim.—1. In a car-coupling device, the combination, with a rocking rod and a segmental frame carrying a chain on its face, of the slotted angle-iron for engaging the head of a coupling-pin, substantially as set forth.

2. In a car-coupling, a quadrantal frame carried by a rocking rod that is provided with a lateral arm, cranks at the sides of the car, and a rod extending from said arm to the top of the car for operating said rocking rod, a chain attached to said frame and engaged by the curved surface thereof, and an angle-iron carried by the chain for engaging the head of a coupling-pin, substantially as set forth.

3. A car-coupling device consisting of a rocking rod bent at its middle to form a quadrantal frame at right angles thereto, and bent also at one side of the middle to form an arm, cranks on the ends of the rod, and a vertical lever connected to said arm, a curved plate secured to the arc of said frame, and a chain secured to its outer angle for raising and lowering a coupling-pin, substantially as set forth.

4. In a car-coupling device, a horizontal rocking rod bent at its middle to form a quadrantal frame at right angles thereto and the arc of such frame provided with lateral beads adapting it to serve as a bearing surface for a chain, substantially as set forth.

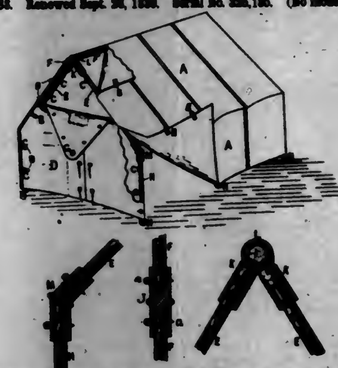
413,728. MACHINE FOR DRYING PAPER. LEWIS W. HOYES, East Pepperell, Mass. Filed Feb. 8, 1889. Serial No. 299,154. (No model.)

Claim.—1. In a paper-drying apparatus, the paper-conveyer and the exhaust or suction box, chamber, or device, combined with heating or drying pipes and hot-air boxes or chambers, all substantially as and for the purposes set forth.

2. In a paper-drying apparatus, a paper-conveyer, combined with an exhaust or suction box, chamber, or device for holding the paper in contact with the conveyer, and a system of heating or drying pipes or conduits in proximity to which the conveyer moves, substantially as described.

3. In a paper-drying apparatus, the endless reticulated paper-conveyer and means, substantially as described, for holding the paper on the conveyer on its upper side by a current of air, combined with the retaining-cylinder, around a portion of which the conveyer is passed, and means, substantially as described, for continuously exhausting the air therefrom, as and for the purposes set forth.

4. In a paper-drying apparatus, the paper-conveyer, combined with the exhaust or suction chamber or chambers having a perforated bottom adjacent to which said conveyer passes and slides to vary the width of opening of said bottom, as and for the purposes set forth.



5. In a paper-drying apparatus, the reticulated paper-conveyer, combined with the hollow cylinder B, having closed ends and slits 8 in its barrel, and around a portion of which said conveyer passes, the shield *f*, closely encircling a portion of the cylinder opposite to that encircled by the conveyer, and means, substantially as described, for exhausting the air from the cylinder through its axis, whereby the paper will be held firmly upon the outer side of the conveyer as it passes around the cylinder opposite said shield, substantially as described.

6. In a paper-drying apparatus, the conveyer having cross-bars *i* and continuously-rotated rollers for moving the conveyer, and the guides for the cross-bars, combined with means, substantially as described, arranged above the conveyer at the lower part of the apparatus for holding the paper by suction, substantially as described.

413,729. CATTLE-FOOD. PAUL F. PALLAS, Dresden, Saxony, Germany. Filed May 26, 1888. Serial No. 312,468. (No specimens.) Patented in Belgium Mar. 6, 1887, No. 80,894; in Germany May 8, 1887, No. 41,970, and Dec. 2, 1887, No. 43,673; in France June 8, 1887, No. 184,095; in England Dec. 21, 1887, No. 17,570; in Norway Jan. 7, 1888, No. 730; in Sweden Jan. 9, 1888, No. 1,314; in Austria-Hungary June 12, 1888, No. 35,903 and No. 49,604, and in Spain Feb. 6, 1889, No. 9,051.

Claim.—The combination of malt and carrageen-moss with alimentary vegetable matters, as specified, and chaff, substantially as and for the purpose set forth.

413,730. TENT. GORDON P. PALMER, Boston, Mass. Filed Feb. 7, 1888. Renewed Sept. 26, 1889. Serial No. 325,195. (No model.)

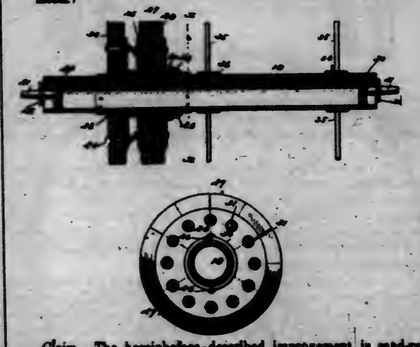
Claim.—1. A wall-tent consisting of the ridge-pole pieces F, connecting socket-pieces J, rafters E, socket-pieces K, having rings L and projections *e*, posts H, connecting angle socket-pieces M, and socket foot-pieces N, as described.

2. An A-tent consisting of the ridge-pole pieces F, connecting socket-pieces J, socket-pieces K, having rings L and projections *e*, rafters E, and angle-socket foot-pieces P, as described.

413,731. CONDUIT FOR ELECTRIC RAILWAYS. CHESTER P. POTTS, Lynchburg, Va. Filed Mar. 23, 1889. Serial No. 304,571. (No model.)

Claim.—1. The combination, with the metallic box or trough, of the metallic slot-rails resting upon the upper edges of the sides and having the flanges and fastening-lips outside of and bolted to the box sides and the bracket-braces inside and supported on foot-rests upon the box sides, substantially as described.

2. The combination, with the metallic box or trough having the exterior laterally-projecting base-flanges and brace-webs, of the metallic slot-rails resting on the upper edges of the box sides and having the flanges outside of the box sides and bracket-braces inside of the box, said outside flange resting on the brace-web and having the fastening-ribs embracing the brace-webs and bolted to the sides of the box.



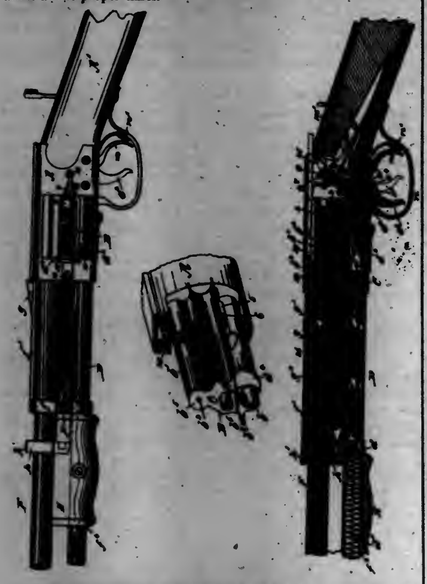
3. The combination, with the metallic box or trough having the interior stay-ribs, with supporting-shoulders at the upper ends, also having the exterior laterally-projecting base-flanges and brace-webs, of the slot-rails resting on the upper edges of the box sides, having the bracket-braces inside of the box and resting on the shoulders of the stay-ribs, also having the outside flanges resting on the brace-webs and provided with downwardly-projecting lips embracing the brace-webs and bolted to the box sides, as set forth.

4. The combination, with the sides of the box or trough, of the slot-rails resting on the upper edges of the box sides and having bracket-brace supports inside of the box, also a flange and bolting-lips extending down outside of the box sides, said flange and bolting-lips being tapered, substantially as set forth.

413,732. INSECTICIDE. JAMES RIDDEL, Fresno City, Cal. Filed Feb. 11, 1889. Serial No. 299,662. (No specimens.)

Claim.—The herein-described composition of matter to be used for the extermination and destruction of insect pests of all kinds which live or feed upon trees, shrubs, fences, plants, or which infest houses, closets, pantries, cupboards, bins, store-rooms, &c., consisting of soft soap, kerosene-oil, lime, oil of pennyroyal, oil of eucalyptus, wood-ashes, sulphur, and salt, in the proportions specified.

413,733. SAND-REEL FOR DRILLING-MACHINES. WILLIAM RICHARDS, Hayburn, Pa. Filed Dec. 7, 1888. Serial No. 292,905. (No model.)



Claim.—The hereinbefore-described improvement in sand-reel pulleys, consisting of a sleeve-like casting adapted to be secured upon the shaft 19, provided with two spaced integral annular flanges upon the periphery, feathers extending from one flange to the end of the casting, a friction-pulley consisting of a series of wooden segments arranged to break joints, located upon the sleeve-like casting at the feathered portions and bearing against one of the said flanges, a detachable flange engaging one face of the pulley, bolts passing through the two flanges and through the said pulley at the center and joints of the several segments, and a brake-pulley rigidly secured to the remaining flange, all arranged substantially as and for the purpose described.

413,734. MAGAZINE FIRE-ARM. SYLVESTER H. ROOT, Boston, Mass. Filed Mar. 12, 1888. Serial No. 266,662. (No model.)

Claim.—1. In a magazine-gun, an intermittingly-rotating carrier having a compartment for the reception of a cartridge, a closed compartment opposite thereto for the permanent reception of a firing-pin and also constituting a recoil-block, an open compartment or space for the passage of the shell outward from the bore of the barrel, and a magazine-filling shelf, combined with a receiver set to receive the rotating carrier and form bearings therefor, a barrel attached to the outer end of the said receiver, and a magazine, substantially as described.

2. In a magazine-gun, the combination, substantially as described.

with a receiver adapted to retain a carrier and form a separating-wall between it and the lock mechanism, a rotary carrier adapted to receive a cartridge to be carried into position to be inserted into the barrel and having a firing-pin attached to and moving with the said carrier, and a recoil-block surrounding the said firing-pin, of a cam-rod rigidly attached to and projecting beyond the said carrier to actuate it at the proper times.

3. In a magazine-gun, a rotating carrier and a cam-rod rigidly attached thereto, combined with a saddle having an adjustable stud extended therethrough in operative connection with and to actuate the said cam-rod by longitudinal movement thereon, substantially as described.

4. The barrel, the magazine, intermittingly-rotatable carrier, and the attached cam-rod reduced at its ends to form journals for the said carrier, combined with a saddle operatively connected with and adapted to intermittingly rotate the cam-rod, and with a bar attached to the said saddle rigidly, and its spring-actuated combined inserter and extractor pivoted thereto at a point intermediate its ends, to operate substantially as described.

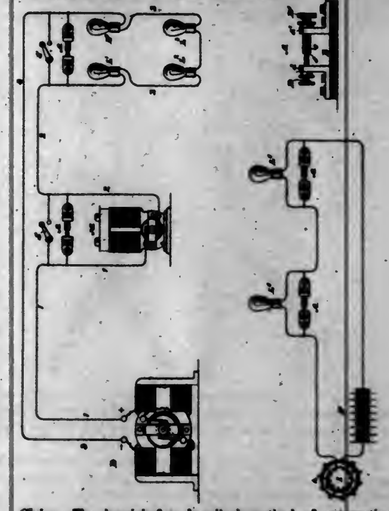
5. In a magazine-gun, the barrel, the magazine, the recessed and slotted receiver, and hammer provided with a projection at its upper end, combined with the reciprocating slide-bar adapted to enter the recessed receiver and having a finger to enter the slot to insert or extract a cartridge, further movement of the said finger being adapted to act upon the said projection and set the hammer automatically after the shell has been extracted, substantially as described.

6. In a magazine-gun, a barrel, a magazine, a carrier, its rigidly-attached cam-rod, substantially as described, to actuate the carrier intermittingly, and a hammer, combined with a reciprocating slide-bar having a spring-actuated finger provided with a projection *f'*, the said finger in its inward movement acting to engage the rim of and extract the cartridge-shell from the barrel and thereafter to set the hammer, and upon its outward movement removing the cartridge from the carrier and inserting it in the bore of the barrel, substantially as set forth.

7. In a magazine-gun, the receiver, the barrel, magazine, cam-rod, and means, substantially as described, to rotate it intermittingly, combined with a carrier rigidly connected to and moving with the said cam-rod and with a reciprocating slide-bar provided with the spring-actuated finger *g*, the said carrier being moved to carry the rim of the shell away from contact with the said finger during the partial rotation of the carrier, substantially as and for the purpose set forth.

8. The receiver, a magazine, and normally-operative spring-latch *d*, attached to the outside of and having its free end projecting within the receiver in front of the mouth of the magazine to retain the cartridge therein, combined with a rotating carrier having a compartment *b* for the reception of the cartridge and provided with the attached cam *d'* adjacent to said compartment to intermittingly move and retain the ratchet momentarily out of operative position as the cam is rotated, substantially as described.

9. The receiver, the carrier having a firing-pin, and the recessed hammer provided with the recoil-spring *o* therein, combined with the mainspring operatively attached to the hammer, and with an adjustable screw-stop *o'* to arrest the mainspring before the hammer strikes the firing-pin, substantially as described.

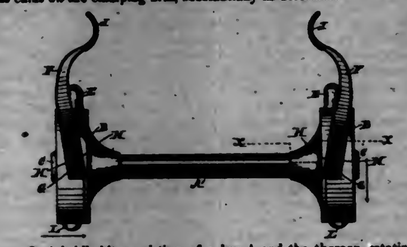


10. In a magazine-gun, a receiver, a barrel, magazine, and intermittingly-rotatable carrier having a curved shelf *b'* and an attached cam-rod to operate the said carrier, combined with a locking device on said carrier, consisting of a slotted sliding bolt, its end co-operating with the notched rear wall 2 of the receiver to hold the carrier in place while the cartridges are being inserted from the said shelf into the magazine to charge the same, substantially as described.

11. The receiver having the notched wall 2 and the intermittingly-rotating carrier combined with a hand-operated locking-bolt attached to the exterior of the carrier and sliding longitudinally thereon and engaging the said notched wall of the receiver at the will of the operator, substantially as described.

12. The receiver, the barrel, and the bracket or limiting-stop *h*, surrounding and fixed upon the said barrel and having a bearing for the reduced outer end of the cam-rod, combined with the carrier and its rigidly-attached cam-rod, substantially as described.

13. The receiver, the magazine, the barrel, and the cam-rod, and means, substantially as described, to rotate it intermittingly, combined with the attached rotatable carrier having a compartment for the reception of a cartridge to be inserted into the magazine, a compartment to receive a cartridge from the magazine, a compartment to receive entirely within it the firing-pin and to constitute the recoil-block, and a compartment or space to permit the outward passage of the shell from the barrel, and with a reciprocating bar sliding in the receiver and having an attached spring-finger to serve both as an inserting device for the cartridge and as an extracting device for the shell, substantially as described.



413,735. METHOD OF AUTOMATICALLY CLOSING AN INTERRUPTED ELECTRIC CIRCUIT. Leonard Schaefer, Boston, Mass., assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Feb. 16, 1889. Serial No. 300,163. (No model.)

Claim.—The hereinbefore-described method of automatically closing a normally-open circuit between two given points upon the interruption of a normally-closed circuit between the same points, which method consists in utilizing a momentary current of abnormal potential, caused by the inductive discharge of an electro-magnet included in said circuit, to act upon an interposed fusible material in such a manner as to permanently complete said normally-open circuit, substantially as set forth.

413,736. BRIDLE-BIT. Ryan T. Shelby, Ripon, Wis. Filed May 6, 1889. Serial No. 309,734. (No model.)

Claim.—1. A bridle-bit consisting of a bar adapted to pass through the mouth of a horse, and on each end thereof a movable case having therein a head-piece on the bar, to which head-piece is pivoted a clamping-arm, a draw-bar, and a spring, the case being provided with an inclined slot, the walls of which are adapted to act as cams on the clamping-arm, substantially as described.

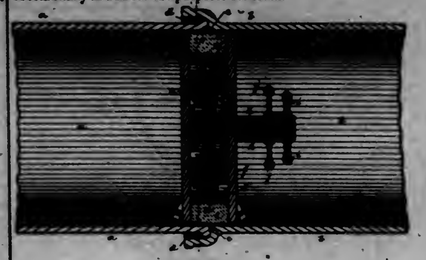
2. A bridle-bit consisting of a bar A and the thereon rotating cases B B, in combination with head-pieces D D, removably secured on the bar A, clamping-arms F F, hinged on the head-pieces D D, bearing against the inclined walls H H of slots G G, springs K K, fixed in the cases B B and connected to the head-pieces D D, and means, substantially as described, for rotating the head-pieces, as and for the purpose set forth.

3. In a bridle-bit, clamping-arms F F, hinged on head-pieces D D, secured on and rotating with a bar A, in combination with cases B B, loose on the bar A and inclosing the head-pieces, and cams in the periphery of the cases, against which the clamping-arms bear and are moved laterally when the bit and clamping-arms are rotated, and means, substantially as described, for rotating the clamping-arms with reference to the cases, as and for the purpose set forth.

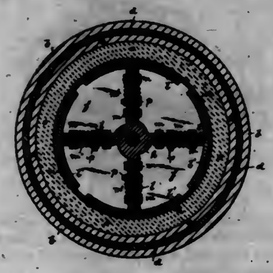
4. In a bridle-bit, a bar A, provided with head-pieces with swinging clamping-arms hinged thereon, and draw-bars pivoted thereto, in combination with cases B B, loose on the draw-bar and provided with bridle-lugs E E, retrieving-springs K K, and means, substantially as described, for throwing the arms F F inwardly against the nostrils of the horse, as set forth.

413,737. APPARATUS FOR SEALING PIPE-JOINTS. Thomas Shelton, McKeesport, Pa., assignor to the National Tube Works Company, same place. Filed June 16, 1887. Serial No. 241,489. (No model.)

Claim.—1. In apparatus for closing the crevice of a pipe-joint during the pouring of the calking material, the combination of a ring of expansible material, a split ring within the expansible ring, two conical frusta fitting within said ring, and means for forcing said cones toward and from one another to expand said split ring, and with it said expansible ring, against the inner surface of the joint, substantially as and for the purposes set forth.

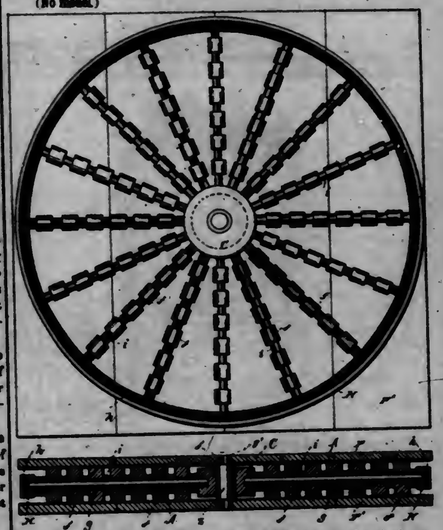


2. In apparatus for closing the crevice of a pipe-joint during the pouring of the calking material, the combination of the ring *n*, of expansible material, the disks *e* and *f*, having the conical frusta or cones thereon, and the split ring *m* between said frusta and the expansible ring, substantially as and for the purposes set forth.



3. In apparatus for closing the crevice of pipe-joints during the pouring of the calking material, the combination of the ring *n*, of expansible material, the two disks *e* and *f*, the inner shaft *g*, and the supporting outer hollow shaft *h*, its outer end forming a journal or bearing for the inner shaft, substantially as and for the purposes set forth.

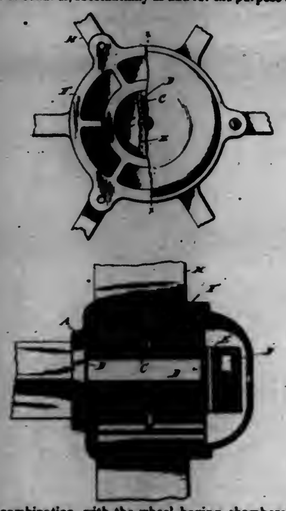
413,738. APPARATUS FOR SEALING PIPE-JOINTS. Thomas Shelton, McKeesport, Pa., assignor to the National Tube Works Company, same place. Original application filed June 16, 1887, Serial No. 241,489. Divided and this application filed Apr. 20, 1889. Serial No. 307,985. (No model.)



Claim.—1. In an apparatus for closing the crevice of pipe-joints, the combination of the ring *o*, of expansible material, the disks *e* and *f*, the cam *k*, the rods *l*, the segments *l'*, the split ring between the segments *l'* and the expansible ring, and means for rotating said cam *k*, substantially as and for the purposes set forth.

2. An apparatus for closing the crevice of pipe-joints, having a head or body carrying a ring of expansible material, mechanism for expanding the expansible ring against the crevice of the joint, and rollers *j'* on said body to support and guide the movement of said body, substantially as and for the purposes set forth.

413,739. PORTABLE TURN-TABLE. Thomas Slevin, St. Louis, Mo. Filed June 19, 1888. Renewed Mar. 26, 1889. Serial No. 304,920. (No model.)



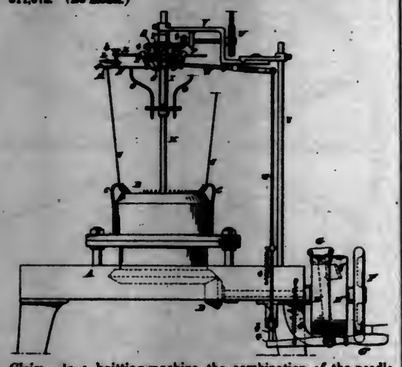
Claim.—1. The turn-table consisting of the rectangular platforms, the hub having the journals *g'*, the radiating rods, the rollers and the spacing-blocks, and the rim, substantially as specified.

2. In a turn-table, the combination of the sectional platforms F F, having metal facing, the hub C, the rods *f*, radiating from the hub, the rim H, having a tire, the rollers on the rods *g*, and the spacing-blocks between the said rollers, substantially as specified.

413,740. CAR-WHEEL. Robert Stalter, New Straitsville, Ohio. Filed July 16, 1889. Serial No. 317,922. (No model.)

Claim.—1. The combination, with the wheel having the flanged collar A, and the axle having collar B, to bear against one side of collar

A, of the sleeve C, held on the axle and obtaining a bearing on the opposite side of collar A, substantially as and for the purpose described.



2. The combination, with the wheel having chambered hub for containing the lubricant and having flanged collar A, of the axle having collar B, and the sleeve held on the axle and adapted to bear on collar A, substantially as described.

3. The combination, with the wheel having chambered hub and oil-passages and having collar A, of the axle having collar B, the sleeve held on the axle and adapted to bear against the collar A, and the cap-plate, substantially as described.

418,741. AUTOMATIC STOP-MOTION FOR KNITTING-MACHINES.

John M. Stevens, Philadelphia, Pa. Filed May 22, 1889. Serial No. 311,672. (No model.)

Claim.—In a knitting-machine, the combination of the needle-head and power mechanism for operating it, a brake-wheel on the power-shaft, having a brake-surface rotating in the plane of the wheel, a brake therefor adapted to press laterally against the surface of said brake-wheel, a spring to apply said brake, thread-guides for guiding the thread to the needle-head, a rotating part provided with a projection, a movable part controlled by the thread and normally held out of the path of the projection of the rotating part, and intermediate lever mechanism between the brake and movable part for releasing the brake when the projection of the rotating part acts upon and moves the movable part.

2. In a knitting-machine, the combination of the needle-head and power mechanism for operating it, a brake-wheel, a brake therefor, and automatic stop-motion mechanism controlled by the thread leading to the knitting-head to apply the brake in case the said thread should break or have too high a tension put upon it, said stop-motion mechanism consisting of a power cam-wheel continually rotating a pivoted thread-supporting guide and arm, a pivoted lever controlled by said arm, a spring to move it in the path of the cam-wheel when released by the pivoted arm, and trip mechanism controlled by the movement of the pivoted lever when acted on by the cam-wheel to apply the brake.

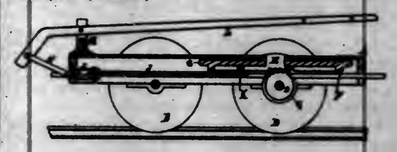
3. In a knitting-machine, a needle-head and power mechanism to operate it, having a belt-shifter to stop the machine, in combination with an automatic stop-motion mechanism consisting of a rotating cam-wheel, a thread-guide having a pivoted arm supported by the thread passing through the guide, a vertically-movable frame or sleeve, a pivoted lever held by said arm away from the path of the cams on the cam-wheel, a spring to pull said lever into the path of the cams when the arm should be liberated from the thread, and trip devices for controlling the belt-shifter actuated by the movable frame or sleeve.

4. In a knitting-machine, a needle-head and power mechanism to operate it, having a belt-shifter to stop the machine, in combination with an automatic stop-motion mechanism consisting of a rotating cam-wheel having stop-motion cams and a resetting-cam, a thread-guide having a pivoted arm supported by the thread passing through the guide, a vertically-movable frame or sleeve, a pivoted lever held by said arm away from the path of the stop-motion cams on the cam-wheel, a spring to pull said lever into the path of the cams when the arm should be liberated from the thread, and trip devices for controlling the belt-shifter actuated by the movable frame or sleeve, and in which the continued rotation of the cam-wheel will by its resetting-cams automatically reset said pivoted lever back of the catch of the pivoted arm when the thread is readjusted in the thread-guide.

5. In a stop-motion mechanism, the thread-guide consisting of the frame L, having the two pivoted fingers or guides M, the spring *m*, to hold said fingers up against normal tensions of the thread, and the pivoted locking-arm N, arranged in a space between the pivoted fingers and supported by the thread passing over said fingers.

6. In a stop-motion mechanism, the thread-guide consisting of the frame L, having the two pivoted fingers or guides M, the spring *m*, to hold said fingers up against normal tensions of the thread, the adjusting-screw R, to vary the tension of the thread, and the pivoted locking-arm N, arranged in a space between the pivoted fingers and supported by the thread passing over said fingers.

7. In a stop-motion mechanism, the thread-guide consisting of the frame L, having the two pivoted fingers or guides M, the spring *m*, to hold said fingers up against normal tensions of the thread, the pivoted locking-arm N, arranged in a space between the pivoted fingers and supported by the thread passing over said fingers, the supporting-arm K, an adjustable connection between the frame L and said arm, and a support for the locking-arm N and the supporting-arm K.

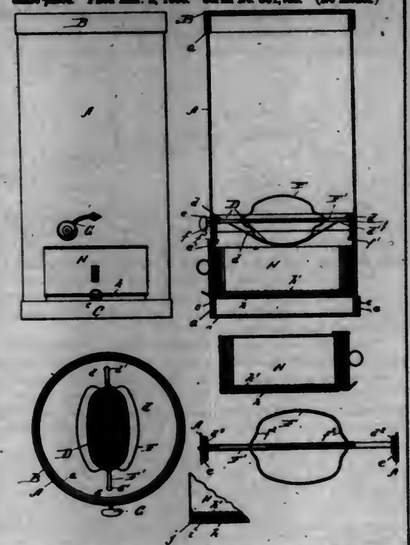


8. The combination of a knitting-machine, a standard H, a vertically-movable frame or sleeve I, having arms K extending therefrom, thread-guides secured to the ends of said arms, a rotating cam-wheel S, having cams *s* T, pivoted levers P, carried by the sleeve, springs whereby said levers P are pulled into position to be acted on by the said cams, a pivoted arm supported by the thread passing through the thread-guide and adapted to lock the pivoted levers P away from the path of the cams, and mechanism to stop the motion of the knitting-machine actuated by the sleeve or movable frame.

9. In a stop-motion for a knitting-machine, the combination of a standard, a stop-motion sleeve or frame capable of vertical movement, a rotating cam-wheel journaled on the standard, one or more radiating thread-guides about said standard, spring-actuated levers actuated by the cam-wheel to move the sleeve or frame, and latches controlled by the thread in the thread-guides to normally hold the levers out of the path of the cams on the cam-wheel.

10. In a knitting-machine, the combination of the needle-head with a series of thread-guides arranged about said head, a stop-motion mechanism arranged above and substantially central with respect to the needle-head and having a series of radiating thread-guide arms provided with thread-guides adjustable upon their arms about a vertical axis and arranged substantially above the thread-guides for the needle-head, mechanism to stop the motion of the knitting-machine, and means, substantially as shown, centrally located with respect to said radiating thread-guides and controlled thereby to operate said mechanism to stop the knitting-machine.

418,742. HAND-CAR.



Ira R. Stump, Richville, assignor of one-half to Calvin S. Pierce, Cleveland, Ohio. Filed Mar. 29, 1889. Serial No. 305,285. (No model.)

Claim.—In a hand-car, and in combination with one of the axles thereof, the spur-wheel G, crown-wheel N, having the flange *a*, the connecting-rod J, crom-head I, link F, and actuating-lever L, the parts being arranged and operating in the manner and for the purpose set forth.

418,743. PORTABLE SCREENING FLOUR-BIN.

Christiaan Tabberman, Chicago, Ill., assignor to himself and Willis M. Sherman, same place. Filed Mar. 2, 1889. Serial No. 301,782. (No model.)

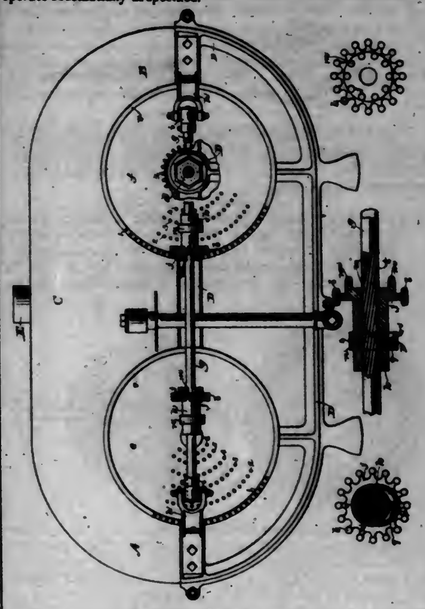
Claim.—1. In a cylindrical pasteboard screening flour-bin, an agitator mounted upon a shaft provided with supports located wholly within the bin and abutting at its ends against the inside walls, in combination with a crank threaded into one end of the shaft and passing through an opening in the wall of the bin of less diameter than the shaft, substantially as set forth.

2. In a cylindrical screening flour-bin made of pasteboard, the hoops *c* and *c'* and the plates d^2 d^3, in combination with the agitator-shaft, substantially as set forth.

3. In a cylindrical screening pasteboard flour-bin, the agitator, the shaft whereof is supported from hoop *c'*, and the dished screen supported from hoop *c*, in combination with said hoops, substantially as set forth.

4. The cylindrical screening flour-bin made of pasteboard, wherein are combined an agitator and a screen D, said screen having a metal rim *d*, supported upon an interior hoop *c* of the bin, substantially as set forth.

5. In a cylindrical screening flour-bin made of pasteboard and provided with a removable drawer located in the body of the cylindrical bin, an interior hoop *c'*, located just above the drawer-opening, substantially as and for the purpose specified.



418,744. GEARING FOR OPERATING APPARATUS FOR MIXING AERIFORM FLUIDS.

Caleb C. Walworth and Herman Seitzer, Boston, Mass. Filed Oct. 23, 1888. Serial No. 288,706. (No model.)

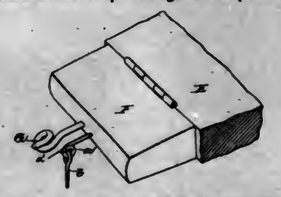
Claim.—1. The combination, with arbors *c* and *d*, arranged to operate the wheels of a gas and air meter, of multiple crown-wheels *e f*, secured to the arbors *c* and *d*, respectively, and the coacting pinions *j*, arranged upon a common shaft and provided with locking and releasing devices, whereby they may be enmeshed with the several series or circles of teeth in their respective crown-wheels, substantially as specified.

2. The combination, with arbors *c* and *d*, arranged to operate the wheels of a gas and air mixing meter, of multiple crown-wheels *e f*, secured to the arbors *c* and *d*, respectively, and formed with a series of internal circles of teeth, and a peripheral flange *v*, having teeth thereon projecting beyond the plane of the interior teeth, and pinions *j*, mounted upon a common shaft and formed with peripheral teeth *l* and a circle of interior teeth *m*, all substantially as specified.

3. The combination, with arbors *c* and *d*, arranged to operate the wheels of a gas and air mixing meter, of multiple crown-wheels *e f*, secured to the arbors *c* and *d*, respectively, and pinions *j*, mounted on shaft *g*, formed with longitudinal slot *t* and duly-spaced holes *u*, rings *n*, their pins *p* and *s*, and spring *q*, all constructed and arranged to operate substantially as specified.

418,745. FLOWER-STAND.

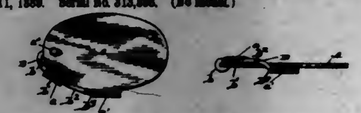
Henry Whitbal, Chicago, Ill. Filed Aug. 4, 1888. Renewed July 23, 1889. Serial No. 318,294. (No model.)



Claim.—A flower-stand consisting of angular brackets provided with steps or rests for supporting a flower-box and having swinging arms 5, which serve to hold the brackets in position, in combination with a flower-tray resting thereon and provided with an angular attaching-socket having means for engaging the steps and the risers of the stand, all substantially as set forth.

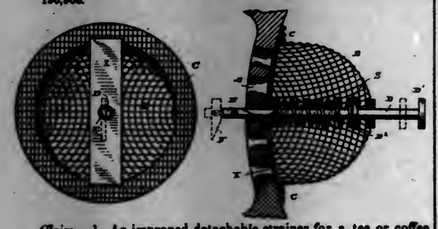
418,746. KINK-ARRESTER FOR SPINNING-FRAMES.

Thomas D. Wilkerth, Snidersville, Mass. Filed July 23, 1888. Serial No. 281,262. (Model.)



Brief.—The object of the invention is to provide a kink-arrester which shall be adapted for use with different weights of yarn and which cannot be thrown up and lodge in an inoperative position.

Claim.—The combination, with the kink-arrester, of a support having an eye shaped to suspend the kink-arrester and enable it to swing, and having a forwardly-extended stop portion to prevent the

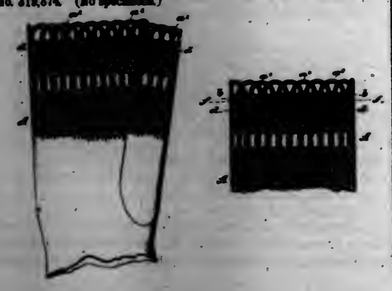


kink-arrester turning over and above the top of the support, to operate substantially as described.

413,747. TAG. Elza Anderson, Kansas City, Mo. Filed June 11, 1889. Serial No. 313,893. (No model.)

Claim.—A clothes-marker consisting of a plate provided with oppositely-projected hooks and an irregularly-carved pin loosely engaged with said plate, the said pin provided with carved portions b b' b^2 b^3, substantially as set forth.

413,748. TEA OR COFFEE POT OR SIMILAR VESSEL. Arthur H. Bowman, London, England. Filed Feb. 12, 1889. Serial No. 299,685. (No model.) Patented in England Oct. 26, 1885, No. 12,951, and Nov. 10, 1886, No. 14,562; in New South Wales July 5, 1886, No. 1,575; in Belgium Mar. 19, 1888, No. 81,902, and in France May 30, 1888, No. 190,908.

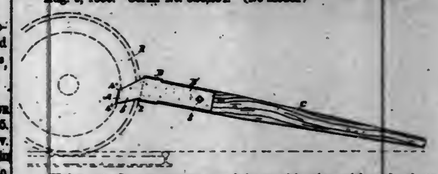


Claim.—1. An improved detachable strainer for a tea or coffee pot or similar vessel, comprising a strainer proper, of fine wire-gauze, of a dome shape, an attaching-pin projecting centrally through the apex of the dome and having a knob fast on its outer end and adapted to be grasped by the fingers for manipulating the strainer, and an attaching device at the opposite end of said pin, substantially as hereinbefore specified.

2. An improved detachable strainer comprising a flexible strainer proper, of fine wire-gauze, of a dome shape, an endwise-movable attaching-pin projecting centrally through the apex of the dome and having a knob fast on its outer end, an attaching device carried by the opposite end of said pin, and a spring reacting against abutments carried by the said pin and strainer proper, respectively, substantially as hereinbefore specified.

3. An improved detachable strainer comprising a strainer proper, of fine wire-gauze, of a dome shape, having a marginal rim, an attaching-pin projecting centrally through the apex of the dome, an attaching device carried by said pin and adapted to engage with the ordinary perforated strainer of a tea or coffee pot, and a spring reacting against abutments carried by the said pin and strainer proper, respectively, substantially as hereinbefore specified.

4. In combination with a strainer proper, of fine wire-gauze, of a dome shape, having a marginal rim and a cross-bar in the plane of the said rim, an attaching-pin extending through the apex of said strainer and having a fixed collar within the latter, a spring confined between said cross-bar and collar, and a gravitating finger pivoted to said pin and adapted to engage with the ordinary perforated strainer of a tea or coffee pot, substantially as hereinbefore specified.



413,749. TRIMMING. Enoch Carrier, Brooklyn, N. Y., assignor to the Jennings Lace Works, same place. Filed Aug. 6, 1889. Serial No. 319,574. (No specimens.)

Claim.—1. A trimming comprising two plies of fabric at its edge and a series of loops projecting therefrom, each loop having one of its ends secured to one of the plies and its other end to the other ply, as set forth.

2. The trimming A, comprising two plies of fabric and having the projecting loops a^2, that are twisted throughout their length, each loop being connected at one end to one of the plies and at its other end to the other ply, substantially as described.

413,750. CAR-MOVER. Laurens A. Post, Raleigh, N. C. Filed Aug. 9, 1889. Serial No. 320,261. (No model.)

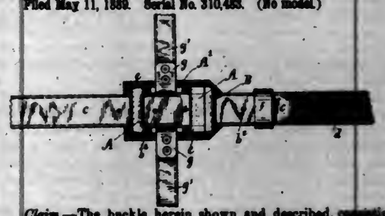
Claim.—1. In a car-mover, and in combination with a hook to enter behind the rim of the car-wheel, the open-ended socket to receive the handle-bar of the implement, provided with a dog or biting-edge formed by an edge of said socket, substantially as described.

2. In a car-mover, and in combination with a hook to enter behind the rim of the car-wheel, a socket to receive the handle-bar of the implement, provided with a dog or biting-edge in line with a wall of said socket, substantially as described.

3. In a car-mover, and in combination with a socket to receive the handle-bar, provided with a dog, a hook composed of a point arranged in front of said socket and dog, and a body or member connecting the said point with the said socket and obliquely disposed in (approximately at least) a plane parallel with the length of said socket, the top and bottom edges of said body or member being both oblique to the length of the said socket, substantially as described.

4. In a car-mover, and in combination with a socket to receive the handle-bar, provided with a dog, and the hook-body or connecting member, the hook-point transverse to the length of said socket, arranged in front of said dog, and having one at least of its top and bottom edges sloped from the base of said point outward, substantially as described.

5. In a car-mover, a socket with a dog at one edge thereof, in combination with a hook having its point opposite said dog and an obliquely-disposed body or connecting member between said point and said socket, substantially as described.

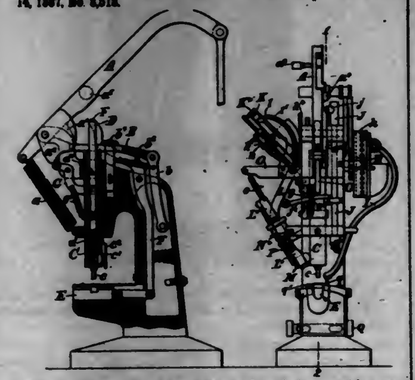


6. A car-mover comprising a handle-bar, an open-ended socket provided with a dog, and a hook having its point arranged in front of said socket and dog, leaving the open front end of said socket exposed for driving a wedge into the handle-bar, substantially as described.

7. The head of a car-mover, comprising the open-ended socket provided with a dog at its front end, the obliquely-disposed hook-body projecting forward from said socket, and the hook-point projecting laterally from said hook-body in front of said socket and dog, substantially as described.

8. The head of a car-mover, comprising the open-ended socket provided with a dog at its front end, a hook-body projecting forward from said socket, and a hook-point projecting laterally from said hook-body and front of said socket and dog, and having its top and bottom edges one above and the other below the said dog, so as to catch the car-wheel when said head, after application to the rim of said wheel, is moved either up or down, substantially as described.

9. The head of a car-mover, comprising a socket to receive the handle-bar, open at its front end also, and provided with a dog at the said front end, and a hook having its point arranged in front of said socket and dog, substantially as described.



413,751. BUCKLE. Michael H. Freidline, near Fredonia, Kans. Filed May 11, 1889. Serial No. 310,483. (No model.)

Claim.—The buckle herein shown and described, consisting of the walls A', having integral loops A A at either end thereof of nu-

equal altitude, and an integral extension a', projecting laterally from the end having the highest loop, provided with an abutment a^2, in combination with the wedge B, having a tapering tongue b, provided with lateral projections b^2 to retain the straps C d in position laterally, having, moreover, a lug b', that engages a perforation in the straps C and abuts against the wall a^2 of the extension a, and the loop f, the whole co-operating as and for the purpose set forth.

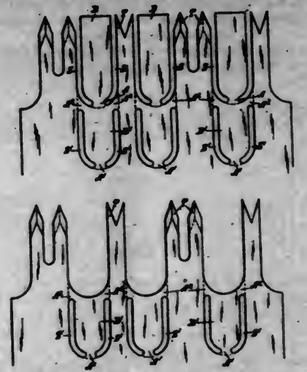
413,752. PUNCHING AND EYELETING MACHINE. Arthur Garrett, Towcester, and Gilbert Wherrin, Astwick, County of Northampton, assignors to John Phipps, Northampton, England. Filed Jan. 22, 1889. Serial No. 297,172. (No model.) Patented in England June 14, 1887, No. 8,513.

Claim.—1. A combined punching and eyeleting machine consisting, essentially, of a reciprocating punching-cylinder carrying a laterally-movable punch, a cramping-rod reciprocating in said cylinder in line with said punch, and a shifting anvil for receiving the punch and cramping-rod, substantially as described.

2. A combined punching and eyeleting machine consisting, essentially, of a reciprocating punching-cylinder carrying a laterally-movable punch, a cramping-rod reciprocating in said cylinder in line with said punch, a shifting anvil for receiving the punch and cramping-rod, and an operating-lever and connections between the same and the punching-cylinder, anvil, and cramping-rod for operating them in proper sequence, substantially as described.

3. A combined punching and eyeleting machine consisting, essentially, of a reciprocating punching-cylinder carrying a laterally-movable punch, a cramping-rod reciprocating in said cylinder in line with said punch, a shifting anvil for receiving the punch and cramping-rod, and a feeding and delivery mechanism for presenting eyelets, one by one, in proper position beneath the cramping-rod, substantially as described.

4. A combined punching and eyeleting machine consisting, essentially, of a reciprocating punching-cylinder carrying a laterally-movable punch, a cramping-rod reciprocating in said cylinder in line with said punch, a shifting anvil for receiving the punch and cramping-rod, and a plurality of feeding and delivery mechanisms for presenting eyelets, one by one, in proper position beneath the cramping-rod, substantially as described.



5. A combined punching and eyeleting machine consisting, essentially, of a reciprocating punching-cylinder carrying a laterally-movable punch, a cramping-rod reciprocating in said cylinder in line with said punch, a shifting anvil for receiving the punch and cramping-rod, a feeding mechanism having a swinging pendent chute or carrier for presenting eyelets, one by one, in proper position beneath the cramping-rod, a partially-rotating crank-rod connected to said chute to swing the same, an operating-lever, and connections between said lever and the punching-cylinder, anvil, crank-rod, and cramping-rod for operating them in proper sequence, substantially as described.

6. A combined punching and eyeleting machine consisting, essentially, of a reciprocating punching-cylinder carrying a laterally-movable punch, a cramping-rod reciprocating in said cylinder in line with said punch, a shifting anvil for receiving the punch and cramping-rod, a plurality of feeding mechanisms having swinging pendent chutes or carriers for presenting eyelets, one by one, in proper position beneath the cramping-rod, a partially-rotating crank-rod connected to said chutes to swing the same, an operating-lever, and connections between said lever and the punching-cylinder, anvil, crank-rod, and cramping-rod for operating them in proper sequence, substantially as described.

7. In a combined punching and eyeleting machine, the combination, with the punching and eyeleting mechanism of a work-gage, consisting of a pair of pivoted arms located upon the opposite sides of the anvil of the eyeleting mechanism, and having pins g g', arranged to enter the last-made hole in the material, and the sliding cam-faced bolt Q, acting upon both of said arms to raise one and depress the other, substantially as described.

8. The combination, in a punching and eyeleting machine, of a reciprocating punching-cylinder carrying a pivoted punch, and a reciprocating cramping-rod located within said cylinder in line with said punch and acting, when moved downward, to engage with the punch and move the same laterally out of its path.

413,753. SAW. James H. Griffith, Kingsmill, assignor of one-half to George A. Tuttle, South Dorchester, and David A. Short, Aylmer, Ontario, Canada. Filed Aug. 17, 1889. Serial No. 321,086. (No model.)

Claim.—1. A saw-blade having the transverse slots S formed therein, substantially as and for the purpose set forth.

2. A saw-blade having the transverse slots S' formed therein, substantially as and for the purpose set forth.

3. A saw-blade having the slots S S' formed therein, substantially as and for the purpose set forth.

4. A saw-blade having the blocks B between the teeth and connected therewith by the arms A, substantially as and for the purpose set forth.

5. A saw-blade having the blocks B' connected therewith by arms A' A^3, substantially as and for the purpose set forth.

6. A saw-blade having the blocks B and B' connected therewith by the arms A and A' and A^3, respectively, substantially as and for the purpose set forth.

7. A saw-blade having the slots S S' formed therein, and the blocks B and B' connected therewith by the arms A and A' and A^3, respectively, substantially as and for the purpose set forth.

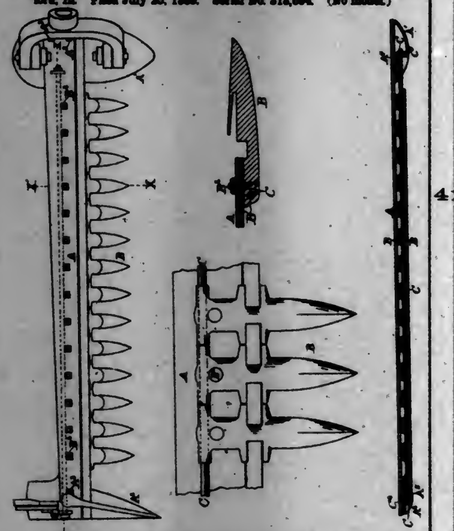
413,754. TOP-PROP JOINT. George W. Hamm, South Bend, Ind. Filed Mar. 30, 1889. Serial No. 305,260. (No model.)

Claim.—1. A plate and spindle preferably cast integral therewith, in combination with a thimble screwing onto said spindle, substantially as specified.

2. A plate provided with a spindle, in combination with a thimble, a brace and its nut, and a spring interposed between said brace and thimble, substantially as specified.

3. A plate and spindle preferably formed integral therewith, in combination with a thimble flanged at its base, a brace and its nut, and a flat spiral spring inserted between the head of the brace and the thimble, substantially as specified.

4. A plate having a screw-threaded spindle, in combination with a flanged interiorly-screw-threaded spindle, a brace and its nut, and a



flat spiral spring or washer interposed between said brace-head and thimble, substantially as specified.

5. The plate A, having screw-threaded spindle A', in combination with flanged interiorly-screw-threaded spindle B, brace E, having head E', provided with a polygonal aperture for the reception of a similarly-constructed nut F, and a flat spiral spring D, interposed between the brace-head E' and the thimble B, substantially as specified.

6. A pivot screw-threaded at its extremity, in combination with a brace turning upon said pivot, provided with a polygonal aperture, and a nut screwing onto said pivot and provided with a shoulder fitting into said aperture, substantially as specified.

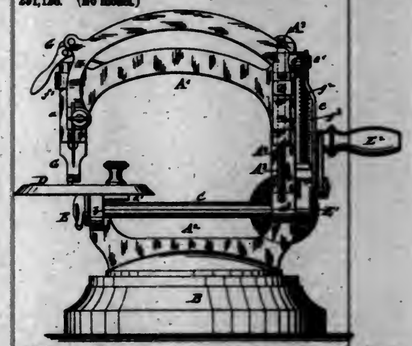
7. A pivot screw-threaded at its extremity, in combination with a brace turning upon said pivot, a spring interposed between the base of the pivot and the brace, the brace being provided with a polygonal aperture, and a nut screwing onto the pivot and provided with a shoulder fitting into said aperture, substantially as specified.

418,755. FINGER-BAR FOR MOWERS. GOTLAF JENSENIUS, Rockford, Ill. Filed July 25, 1889. Serial No. 318,004. (No model.)

Claim.—1. In combination, a finger-bar, inside and outside shoes depending therefrom and rigidly connected therewith, laterally-abutting guards secured to said finger-bar and having transverse openings therein to admit a truss-rod, and truss-rod passed through the transverse openings in said shoes and guards, the several parts being constructed and arranged to render said finger-bar vertically rigid, substantially as and for the purpose specified.

2. In combination, the finger-bar A, the inside and outside shoes A' A^3, rigidly connected therewith by means of the bolts A^3, the laterally-abutting guards B, provided with transverse openings B' therein and bolted to the finger-bar A, the truss-rod C, passed through the transverse openings B' A^4 A^5 in the guards B and inside and outside shoes A' A^3, and the nuts C' C^3, applied to the ends of the truss-rod C to secure all of said parts rigidly together, substantially as and for the purpose specified.

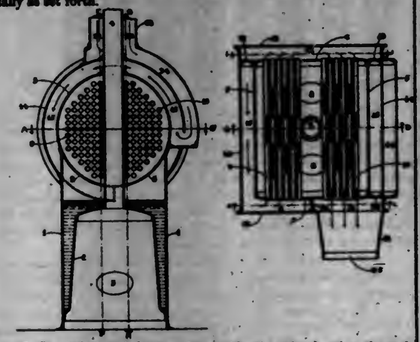
418,756. PUDDLER. MATHIAS H. JOHN, Escanaba, Mich. Filed Apr. 20, 1889. Serial No. 307,921. (No model.)



Claim.—1. The combination of a substantially rectangular compartment provided with side compartments, two-main aisles leading thereto, cross-aisles connecting such main aisles, and a set of blocks movable within such aisles and compartments, substantially as described.

2. The combination of a rectangular space A, provided with five compartments at each side, main aisles B and C, leading thereto, cross-aisles H and I, connecting the main aisles, and a set of twenty blocks sliding within such aisles and rectangular space, substantially as described.

418,757. SEWING-MACHINE. CHARLES LEWY, New York, N. Y., assignor to Jacob Kohn, same place. Filed Nov. 17, 1888. Serial No. 291,126. (No model.)

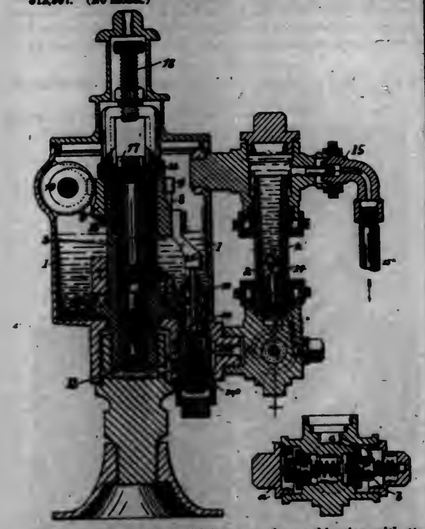


Claim.—1. The combination of a supporting main standard having a yoke-shaped upper arm provided with a grooved head at one end and a fixed guide-rod at the other end, a driving crank-shaft carrying the loop-forming hook at one end and a crank at the opposite end, a yoke-shaped needle-bar provided with a guide-hook at one end and guide-eyes at the opposite end, and a connecting-rod pivoted to the crank of the driving-shaft and the needle-bar, substantially as set forth.

2. The combination of a supporting-standard having a yoke-shaped upper arm provided with a grooved head, a fixed guide-rod secured to the opposite end of the main arm, a yoke-shaped needle-bar provided with a guide-hook at the outer end and guide-eyes at the opposite ends, a driving crank-shaft, a connecting-rod pivoted to the crank-shaft and needle-bar, a bracket-plate attached to the needle-bar and having a guide-eye, and a cushioning-spring applied to a fixed guide-rod of the main arm, so as to assist in raising the needle-bar, substantially as set forth.

418,758. COMBINED AIR-HEATER AND STEAM-BOILER. PETER LITHER, THOMAS HASLAM, and JOHN MOORHOUSE, Liverpool, County of Lancaster, England. Filed Mar. 12, 1888. Serial No. 266,963. (No model.)

Claim.—1. The combination, with a steam-boiler, of an air-heater having an outer inclosing-shell with a division therein at one end, an opening on each side of said division—one for the admission of air to be heated and the other for the exit of the heated air—an inner shell with a space between it and the outer shell at each end and around a portion of its periphery, and a series of pipes within the inner shell, substantially as described.



2. The combination, in one structure, of a steam-boiler with a tubular air-heater, the latter consisting of a chamber which forms part of the steam-space of the boiler, through which chamber pass a number of tubes divided into stacks, an annular passage which partially surrounds the said chamber, an air-inlet which surrounds the chimney of the boiler, a passage connecting the air-inlet to the annular passage, tube-doors, and division-plates to direct a current of air entering the air-inlet, so that it passes through the annular passage and then passes in succession through each stack of tubes, substantially as set forth.

3. In a tubular air-heater, the combination of a chamber through which pass a number of tubes divided into stacks, an annular passage which partially surrounds the said chamber, an air-inlet which surrounds a boiler or other chimney, a passage connecting the air-inlet to the annular passage, tube-doors, and division-plates to direct a current of air entering the air-inlet, so that it passes through the annular passage and then passes in succession through each stack of tubes, substantially as set forth.

4. The combined air-heater and steam-boiler, consisting, essentially, of the boiler 1, the inner shell 5, the outer shell 14, the annular passage 15, the tube-plates 6 and 7, the stacks of tubes 9 and 10, the tube-doors 16, 17, and 18, the air-inlet 22, surrounding the chimney 4, and the division-plates 19, 20, and 21, all substantially as herein described and illustrated.

418,759. SIGHT-FEED LUBRICATOR. GEORGE M. MARSHALL, Huddersfield, County of York, England. Filed June 3, 1889. Serial No. 312,907. (No model.)

Claim.—1. In a sight-feed lubricator, the combination, with the outer casing and the cylinder therein, provided at its base with an enlarged chamber for the reception of the oil for lubrication, and an outlet for the oil from said chamber, the plunger playing in said cylinder and its lower end adapted to enter said chamber and force the oil therefrom, and the operating mechanism of the lubricator, consisting of the cams and springs arranged substantially as set forth, of the valve arranged in the passage leading from the chamber below said plunger, its stem arranged in the path of a projection from one of said cams, whereby the movement downward of said cams opens the valve for the admission of oil to the chamber from the oil-reservoir, substantially as and for the purposes set forth.

2. In a sight-feed lubricator, the combination, with the outer casing containing oil and the cylinder arranged therein, and the chamber below said cylinder for the reception of the oil to be fed to the parts to be lubricated, of a valve controlling the admission of oil to said chamber and means, substantially as described, for opening and closing said valve.

3. In a sight-feed lubricator, the combination, with the fixed outer casing and the cylinder arranged therein, provided at its base with a chamber and a passage leading thereto for the admission of the oil to be fed, of the plunger in said cylinder, its lower end entering said chamber beneath the cylinder, means, substantially as described, for operating said plunger, and means for varying the stroke of said plunger, consisting of the adjusting-screw mounted in the casing, its lower end adapted to press upon the upper end of said plunger and limit the movement thereof.

418,760. VEHICLE-WHEEL. WALTER F. MABEE, Benton, Iowa. Filed Apr. 16, 1889. Serial No. 307,470. (No model.)

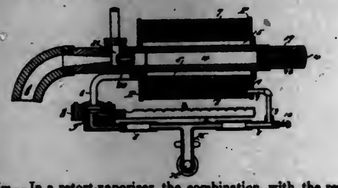
Claim.—1. In a wheel, the main axle, tire, and spokes, in combination with the sections B and C of the hub, and a threaded sleeve upon which said sections move, said sleeve being formed of two parts, one of which is formed with a socket and the other with a head adapted to fit within said socket, and a pin passing through the socket and engaging the head, whereby the two parts of the sleeve are held together, substantially as described.

2. An improved wheel, consisting of the main axle, the tire, and the spokes, the sections B and C of the hub, and the threaded sleeve upon which the sections move, said sleeve being formed in two parts, having their outer ends adapted to receive a wrench and their inner ends formed with heads adapted to be fitted together, one of said heads having an annular groove which receives a screw carried by the other head, whereby the two parts of the sleeve may be turned independently, substantially as described.

418,761. CROCHETING OR OVERSEAMING MACHINE. JOSEPH M. MERROW, Merrow, Conn. Filed Oct. 15, 1887. Serial No. 252,416. (No model.)

Claim.—1. In a machine such as described, the combination, with the needle and looper and means for reciprocating them, and a finger or plate around which loops may be formed by the needle and looper, of a shoulder, as at f^{16}, occupying a position above said finger or plate and between the latter and the path traversed by the looper around the edge of the fabric, substantially as described.

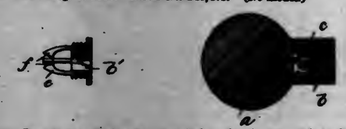
2. In a machine substantially such as described, the combination, with a reciprocating needle and a reciprocating crochet-hook, and means for controlling the movements of said needle and hook, of a thread stop or guide in proximity to the needle for controlling the position of the needle-thread, and a retaining shoulder or guide, as at f^{16}, for the loops carried by the hook, said last-named shoulder or guide occupying a position between the plane of motion of the needle and the path traversed by the crochet-hook around the edge of the fabric, substantially as described.



3. In a machine such as described, the combination, with a crochet-hook and a needle, and means for operating the same, of a finger or plate around which loops may be formed, and a finger or projection, as at f^{15}, provided with a retaining shoulder or guide for the needle-thread and a shoulder or guide engaging the loops carried by the crochet-hook, said last-named finger or projection being supported to occupy a position between the finger or plate around which the loops are formed and the path traversed by the crochet-hook, substantially as and for the purpose described.

4. In a crocheting or overseaming machine, the combination, with a needle and looper and means for actuating the same, and a finger around which loops may be formed, of a presser-foot provided with a lateral extension forming a finger or projection for engaging the loop carried by the looper when advancing toward the needle-thread, substantially as described.

5. In a machine substantially such as described, a reciprocating needle and a crochet-hook reciprocating above and below the fabric in planes transverse to the needle, in combination with a presser-foot provided with a finger or projection for engaging the loops, and a guide or stop, such as f^{21}, for engaging the needle-thread, substantially as described.



6. In a crocheting or overseaming machine, the combination, with a reciprocating needle and crochet-hook, and a finger or plate around which loops may be formed, of a second or loop-engaging finger, as at f^{15}, overlapping the first-named finger or plate and located beneath but in proximity to the path traversed by the crochet-hook above the fabric, substantially as and for the purpose specified.

418,762. RETORT-VAPORIZER. LOUIS J. PHELPS, Passaic, N. J. Filed Apr. 5, 1889. Serial No. 306,042. (No model.)

Claim.—In a retort-vaporizer, the combination, with the retort, of the sealed water-jacket surrounding the retort, a burner *b*, for heating the water in the jacket, and a flexible diaphragm, one side of which forms a valve adapted for controlling the supply of vapor to the burner, and the opposite side of which is subjected to the pressure in the water-jacket, substantially as described.

418,763. BUTTON OR STUD. ALBERT RAMDOHR, Berlin, Germany. Filed Aug. 8, 1887. Serial No. 246,475. (No model.)

Claim.—In a two-part button, a tubular shank screw-threaded internally, having a headed stud extending into the center thereof at its inner extremity, the other part of said button being screw-threaded, corresponding to the tubular portion, and having spring-arms provided with inclined ends to slip over the headed stud and inwardly-extending points to catch behind the head, substantially as described.

418,764. MANUFACTURE OF WELDLESS CHAINS. HIPPOLYTE ROSSIER, Birmingham, County of Warwick, England. Filed Aug. 22, 1889. Serial No. 321,693. (No model.)

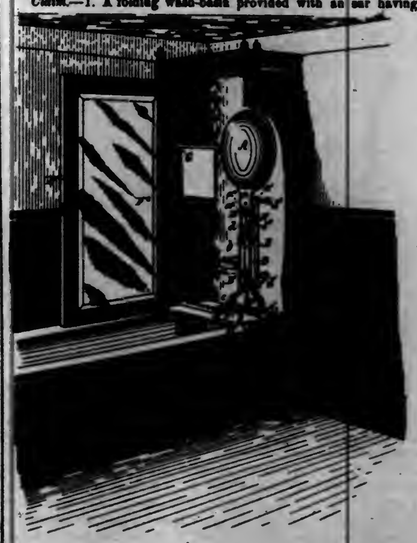
Claim.—1. The manufacture of weldless chains of stayed links by the consecutive series of punching, twisting, and stamping operations, substantially as herein described.

2. In the process of manufacturing weldless stayed chains from a bar of cruciform section, the step in the process which consists in punching out (whether in one or two operations) pairs of mortises corresponding in position to the intervals to be formed between the outer ends of the same series of links, said step being so performed as to prepare the webs for the ultimate operation of removing the metal at these points, and yet leave the metal so disposed as to maintain the transverse stiffness of the bar during the repetition of the same operation on the other pair of webs, as described.

3. In the process of manufacturing weldless stayed chains from a bar of cruciform section, the combination or series of steps herein designated as the second, third, and fourth operations, as described.

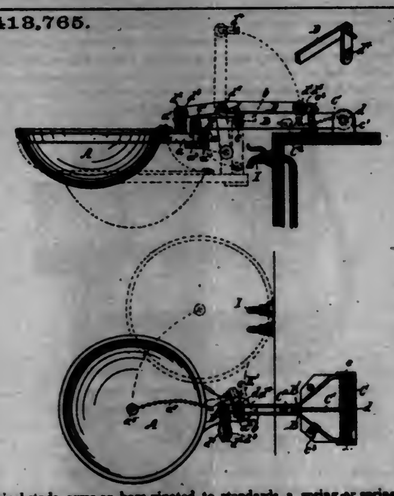
4. In the process of manufacturing weldless stayed chains from a bar of cruciform section, the combination or series of steps herein designated as the second, third, fourth, and fifth operations, as described.

5. In the process of manufacturing weldless stayed chains from a bar of cruciform section, the combination or series of punching and twisting operations herein designated as the second, third, fourth, fifth, and sixth operations, as specified.



6. In the process of manufacturing weldless stayed chains from a bar of cruciform section, the combination or series of steps herein designated as the fifth, sixth, and seventh operations, as specified.

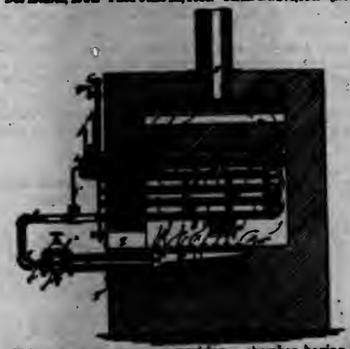
7. In the process of manufacturing weldless stayed chains from a bar of cruciform section, the step which consists in compressing the bows of each link laterally in such a way as to cause the ends of the links to become thickened in the direction of the line of strain and of wear by the upsetting or compression of the metal at these points, as described.



8. In the process of manufacturing weldless stayed chains from a bar of cruciform section by a consecutive series of punching, twisting, and stamping operations, herein described, the method of narrowing the width of the link by punching out the middle of the cross-stay and subsequently contracting the width by lateral pressure, so as to bring the stumps together to form the cross-stay, as described.

418,765. WASH-BASIN. GEORGE L. SEYMOUR, Philadelphia, Pa. Filed Apr. 1, 1889. Serial No. 305,576. (No model.)

Claim.—1. A folding wash-basin provided with an ear having

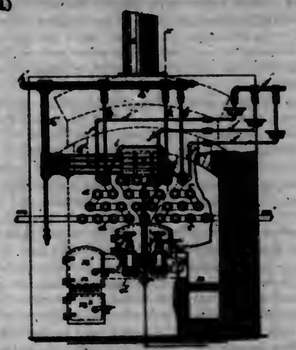


418,765.

swivel-stude, arms or bars pivoted to standards, a spring or springs coiled around said pivot, and the free extremities formed into a coiled bar held between said bars or arms, lever-arms pivoted to said bars or arms, and one of the swivel-studs of said ear, and a fulcrumed lever with a catch and handles pivoted to the other stud of said ear and to said bars or arms, substantially as and for the purposes set forth.

2. The combination, with a bath-tub provided with a cabinet having standards secured to the base thereof, supports pivoted to said standards, springs interposed between said supports, a basin with an ear having swivel-studs, lever-arms connected with said supports and one of the swivel-studs of said ear, and a fulcrumed lever pivoted to said lever-arms and to the other swivel-stud of said ear, substantially as and for the purposes set forth.

418,766. BURNER FOR GAS-GENERATORS. DE WITTE STEARNS, Des Moines, Iowa. Filed June 12, 1888. Serial No. 276,836. (No model.)

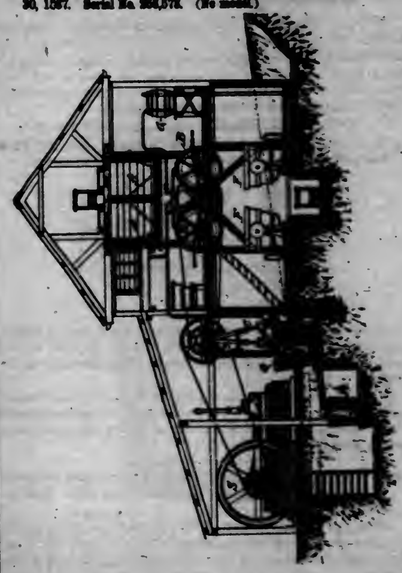


Claim.—1. A gas-burner comprising a chamber having an inlet at one end thereof and having the floor of its interior inclined upwardly from the inlet side to the rear wall in two planes, the one adjacent to the inlet being at a greater angle to the horizontal plane than the other, and a horizontal top of refractory material provided with outlet-orifices at intervals over its entire surface, substantially as set forth.

2. The combination, with flat tiles of refractory material provided with a series of parallel slots beveled at the upper edges, of semi-cylindrical burner-nipples of refractory material, having their lower edges tapered to correspond with the beveled edges of the slots in the tiles, and having transverse slots formed through their rounded upper parts connecting with their interior surfaces, substantially as set forth.

3. A gas-burner comprising a chamber having an inlet at one end thereof and having the floor of its interior inclined upwardly from the inlet side to the rear wall in two places, the one adjacent to the inlet being at a greater angle to the horizontal plane than the other, and a horizontal top of refractory material provided with outlet-orifices over its entire surface, in combination with a gas and air mixing chamber and adit-pipe.

418,767. GAS-GENERATOR. DE WITTE STEARNS, Des Moines, Iowa. Original application filed June 12, 1888, Serial No. 276,836. Divided and this application filed Nov. 2, 1888. Serial No. 289,893. (No model.)

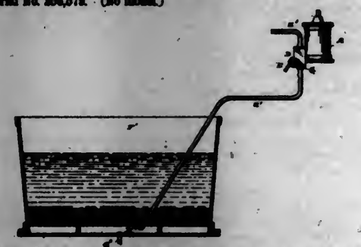


Claim.—1. In an apparatus for the production of gas from liquid hydrocarbons, the combination of a series of retorts each composed of connected pipes arranged in rows embraced in a triangular area and alternately reversed or inverted, substantially as and for the purpose set forth.

2. In an apparatus for the production of gas from liquid hydrocarbons, the combination of a series of retorts each composed of connected pipes arranged in rows embraced in a triangular area, with steam-superheaters placed above the retorts and connected therewith, substantially as and for the purpose set forth.

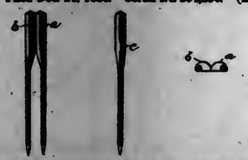
3. In an apparatus for the production of gas from liquid hydrocarbons, in combination, a series of retorts each composed of connected pipes arranged in rows embraced in a triangular area and alternately reversed or inverted, steam-superheaters connected to the retorts, a burner arranged to heat all the retorts and the steam-superheaters, and a connecting-pipe joining one of the retorts to the burner, substantially as set forth.

418,768. APPARATUS FOR THE EXTRACTION OF GOLD BY CHLORINATION. CLEMENS P. J. VAUTIN, London, England. Filed Nov. 20, 1887. Serial No. 255,573. (No model.)



Claim.—1. A hydro-metallurgical gold-extracting apparatus comprising an air-forcing pump in which the suction-valve opens inward from the atmosphere, a pipe into which the delivery-valve of said pump opens, a hermetically-closed vessel in the form of a rotary drum, having an inlet-valve to which said pipe is detachably coupled, and a peripheral man-hole door, a filtering-vessel arranged to receive the discharge of said drum through its man-hole when the drum is opened and inverted, a reflux suction-pump which withdraws the liquid contents of the filtering-vessel, an air or steam agitated vat into which said suction-pump discharges, a deep filter-bed of charcoal which receives the discharge of said vat, and a motor and connections for rotating said drum and operating the pumps, substantially as herein-before specified.

2. In such a hydro-metallurgical gold-extracting apparatus, the combination of an air-forcing pump in which the suction-valve opens inward from the atmosphere, a pipe into which the delivery-valve of this pump opens, a hermetically-closed vessel in the form of a rotary drum constructed to work with considerable internal pressure, and provided with an inlet-valve to which said pipe is detachably coupled, and a peripheral man-hole door and means for rotating said drum and operating said pump, substantially as hereinbefore specified.

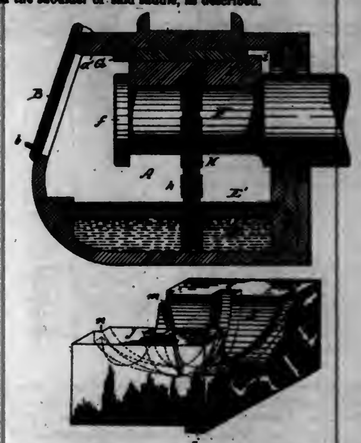


3. In such a hydro-metallurgical gold-extracting apparatus, the combination of a hermetically-closed vessel in the form of a rotary drum having a peripheral man-hole door, a filtering-vessel arranged to receive the discharge of said drum through its man-hole when the drum is opened and inverted, a reflux suction-pump which withdraws the liquid contents of the filtering-vessel, an air or steam agitated vat into which said suction-pump discharges, and a deep filter-bed of charcoal which receives the discharge of said vat, substantially as hereinbefore specified.

413,769. APPARATUS FOR SEPARATING SOLUTIONS OF METALLIC SALTS FROM PULVERIZED MATERIAL MIXED THEREWITH. CLAUDE T. J. VAUTIN, London, England. Filed Nov. 30, 1887. Serial No. 256,573. (No model.)

Claim.—In an apparatus for the separation of solutions of metallic salts from pulverized material mixed therewith, the combination of a suitable filter having a suction-chamber, a pump having a contracted reflux-passage, and a pipe or pipes connecting said chamber with said reflux-passage and with the suction-inlet of the pump, substantially as hereinbefore specified, for the purposes set forth.

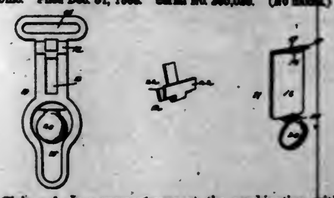
413,770. NEEDLE FOR SEWING-MACHINES. ALPHA O. VERY, Boston, Mass. Filed Dec. 21, 1888. Serial No. 294,256. (Model.)



Claim.—1. A sewing-machine needle having an eye in the point thereof extending from front to rear and a shank set with its longitudinal axis at one side of that of the needle, substantially as described.

2. A sewing-machine needle having an eye in the point thereof extending from front to rear and a shank having its rear slabbed and set with its longitudinal axis at one side of that of the needle, substantially as described.

413,771. CAR-AXLE LUBRICATOR. HENRY F. WISE, Gloucester City, N. J. Filed Mar. 16, 1888. Renewed Mar. 20, 1889. Serial No. 303,393. (No model.)

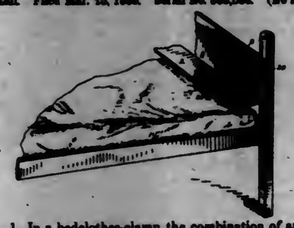


Claim.—1. The combination, with a car-axle box having an oil-well, a journal, and self-feeding lubricant-conveyer consisting of an endless chain mounted on said journal and depending therefrom into said oil-well, of a saddle provided with a shoulder and with a longitudinal channel tapering in both directions to the middle thereof and diverging channels communicating therewith, whereby the lubricant lifted onto said journal may be uniformly distributed over the entire surface thereof, and a block interposed between the top plate of the box and saddle and engaging with a projection formed with said plate and the shoulder of said saddle, as described.

2. The combination, with a car-axle box having an oil-well, a journal, an endless chain mounted thereon, and one or more horizontal bars secured into the front and rear walls of said box for maintaining said chain in operative position and preventing undue lateral movement thereof, of a saddle with a rear shoulder, and a longitudinal channel in the body thereof tapering in both directions to the middle, and narrow channels diverging therefrom to the lower corners, whereby the lubricant lifted onto said journal may be uniformly distributed over the entire surface thereof, and a block engaging with a projection formed with the top plate of the box and with the shoulder of said saddle, all arranged as shown and described, and for the purposes set forth.

3. In a car-axle box, the combination, with the journal of the axle, of a block with a shoulder or projection, and the body of said block being hollowed out with a channel formed therein tapering slightly in both directions to the middle, channels diverging in opposite directions from the central channel to the lower corners of said block, a plate for holding said block in position upon said journal, and an endless chain mounted on said journal and passing downward through a lubricant contained in a reservoir in said box, substantially as and for the purposes described.

413,772. GARMENT-SUPPORT. CLARENCE R. ANDREW, Wellsville, Ohio. Filed Dec. 31, 1888. Serial No. 295,022. (No model.)

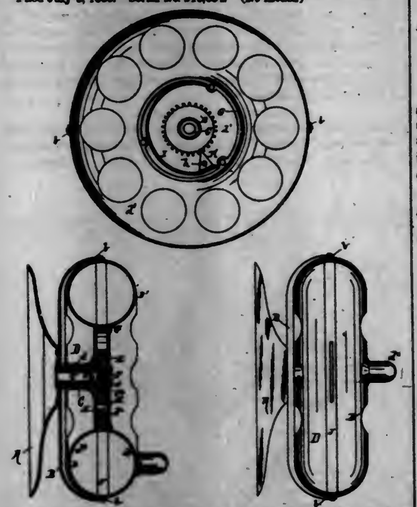


Claim.—1. In a garment-support, the combination, with a body portion having a key-hole slot in its lower end, of the clasp 11, hinged to and sliding on the said body and provided with the shank 21, projecting at an angle from its bottom edge, and with the button 20, extended downward from and at right angles to the shank, the said button having a convex face, substantially as described.

2. In a garment-support, the combination, with a body portion having a key-hole slot at its lower end and a longitudinal slot above the key-hole slot, of the hinge-plate secured in the longitudinal slot of the body portion and sliding thereon and a clasp hinged to the said hinge-plate and provided at its lower end with a button having a convex surface, substantially as herein shown and described.

3. In a garment-support, the combination, with a longitudinally-slotted body portion provided with a key-hole slot at its lower end, of a T-shaped hinge-plate having lugs projecting from each side parallel with the head thereof and a clasp having a slotted upper end and provided with a button at its lower end, the said button having a convex surface and projecting from the end of the clasp and in a different plane from that of the body of the clasp, substantially as herein shown and described.

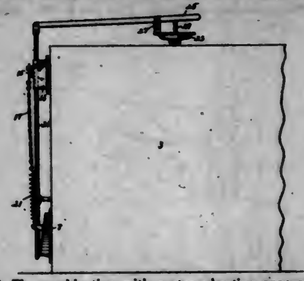
413,773. BEDCLOTHES-CLAMP. THEODORE J. BAKER, Salt Lake City, Utah. Filed Mar. 13, 1889. Serial No. 303,020. (No model.)



Claim.—1. In a bedclothes-clamp, the combination of an adjustable clamping-board adapted to be hinged to a foot-board, the rods connected to the clamping-board and adapted to pass through apertures in the foot-board, and locking devices supported by the foot-board and arranged to engage the rods to positively hold them against endwise movement, arranged and combined for service substantially as herein shown and described.

2. The combination, with a perforated foot-board, of an adjustable clamping-board hinged to the foot-board, the spring-rods secured to the clamping-board and passing through the apertures in the foot-board, and devices on the foot-board in proximity to the apertures therein for engaging the rods to hold them against endwise movement, substantially as and for the purpose described.

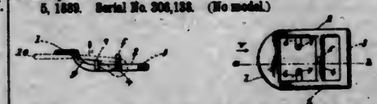
3. The combination of an adjustable clamping-board hinged to the perforated foot-board of a bed, spring-racks secured to the board, and adjustable notched bolts supported in suitable keepers on the foot-board in proximity to apertures therein, through which the spring-racks are passed, and adapted to fit into the notches in said racks, substantially as and for the purpose described.



413,774. FISHING-REEL. CHARLES M. CLEVTON, Ithaca, N. Y. Filed July 8, 1889. Serial No. 316,634. (No model.)

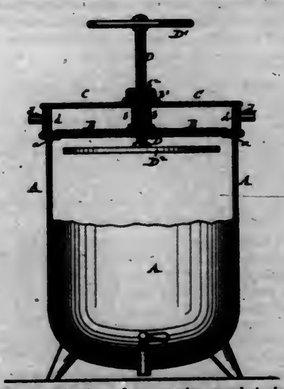
Claim.—In a fishing-reel, the combination of the hollow stud or center post, which serves as an oil-reservoir, an orifice therein for the passage of oil to the reel-bearing, the disks having bearing therespon and being provided with parallel center faces, a peripheral band against which the outer edges of the disks revolve, and the click-wheel and spring-click located in a central orifice in one of the disks, substantially as described.

413,775. TEMPERATURE-REGULATOR. REUBEN H. DRAPER, Minneapolis, Minn. Filed Aug. 16, 1888. Serial No. 282,982. (No model.)



Claim.—1. The combination, with a steam-heating apparatus provided with a suitable draft-opening and a damper therefor, of a thermostatic regulator connected with said damper and controlled by a thermostat located in the room or apartment to be heated, and a pressure-lever arranged to be operated by the pressure of the steam and also connected with said damper, substantially as described.

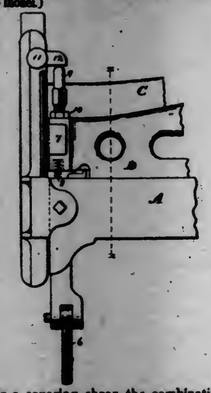
2. The combination, with a steam-heating apparatus provided with a suitable draft-opening and a damper therefor, of a thermostatic regulator governed by the temperature of the room or apartment to be heated and connected with said damper by a suitable spring-connection, and a pressure-lever arranged to be operated by the pressure of steam in the boiler of the apparatus and connected with said damper and adapted to close the same against the tension of the spring-connection of the thermostatic regulator.



3. The combination, with a steam-heating apparatus provided with a suitable draft-opening, of a thermostatic regulator controlled by the temperature of the apartment to be heated and governing said draft-opening when the steam in the boiler is below the maximum pressure desired, and a pressure-lever arranged to close said draft-opening when the steam reaches the maximum pressure desired, and to hold the same closed independently of the thermostatic regulator so long as the steam remains above such pressure.

413,776. BUCKLE. JAMES S. GILBERT, Buffalo, N. Y. Filed Apr. 5, 1889. Serial No. 306,138. (No model.)

Claim.—A buckle consisting of the front and rear cross-pieces 1 and 3 and curved side bars 2, in combination with a cross-bar 4, connected with the side bars 2, an upwardly-projecting tongue 5, and two arms 6, projecting toward each other from the sides 2 and terminating in two upwardly-projecting tongues 7, as and for the purpose described.



413,777. APPARATUS FOR EXTRACTING MEAT-JUICE. ISAAC GILES, New York, N. Y. Filed Oct. 27, 1888. Serial No. 289,206. (No model.)

Claim.—The combination of an exterior vessel A, having an interior seat *a* and an exteriorly-threaded rim *a'*, a cover B, having a center sleeve *b*, a screw-cap C, screwing on the rim and having a cen-

tral screw-nut, a follower at the interior of the vessel, and a screw-spindle attached to the follower and passed to the outside of the vessel, substantially as set forth.

418,778. HOLDING ATTACHMENT FOR TINSMITHS' SQUARING-SHEARS. HIAL S. GRAHAM, Southington, Conn., assignor to the Peck, Stow & Wilcox Company, same place. Filed Feb. 6, 1889. Serial No. 299,894. (No model.)

Claim.—1. In a squaring-shear, the combination of the shear-slide, the holders, the rocker-arm, mechanism connected with said shear-slide for operating said rocker-arm, and the adjustable studs 9 intermediate said rocker-arm and holder, substantially as described, and for the purpose specified.

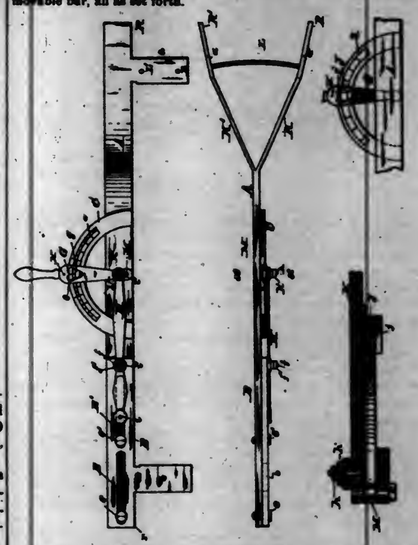
2. The combination of the bed, slide, and blades of a tinsmith's squaring-shears with the pin 14, attached to said slide, the angularly-slotted arm 13, rock-shaft 11, rocker-arm 12, the adjustable bearing-studs 9, and the holder D, substantially as described, and for the purpose specified.

3. The combination of the bed, slide, and blades of a tinsmith's squaring-shears with the pin 14, attached to said slide, the angularly-slotted arm 13, rock-shaft 11, rocker-arm 12, and the holder D, substantially as described, and for the purpose specified.

4. In a squaring-shear having a holder and operating mechanism, the combination of the slide or gate C, bearing the pin 14, and the slotted arm 13, the slot of which has one portion extending at an angle to the path of said pin and another portion coincident with the path of said pin, whereby the angular portion operates the slide and the coincident portion acts to hold the slide, substantially as specified.

5. The combination of the slide, the bed, the holder D, springs for lifting said holder, and mechanism intermediate said holder and slide for depressing said holder through the movement of said slide, substantially as described, and for the purpose specified.

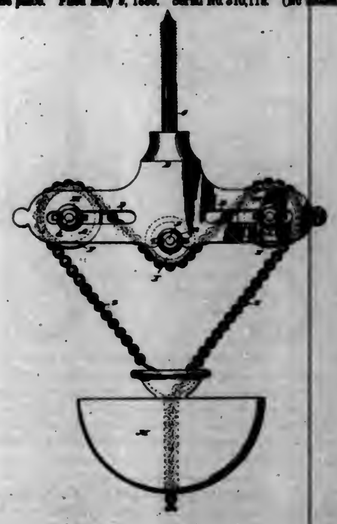
6. The combination of the slide, the bed, the holder D, the adjustable studs 9, mounted on said holder and mechanism intermediate said slide and studs for pressing upon the ends of the latter to depress said holder through the movement of said slide, substantially as described, and for the purpose specified.



418,779. GAGE. PATRICK H. GRIFFIN, Buffalo, N. Y. Filed June 14, 1889. Serial No. 314,268. (No model.)

Claim.—1. A gage for measuring the treads of car-wheels and similar objects, consisting of a stationary bar having two legs and a suitable dial, a further bar provided with a single downwardly-projecting leg, and a lever fulcrumed on the stationary bar and connected with the movable bar by a connecting-rod, said bars being held in sliding contact by screw-bolts passing through apertures in the movable bar, as and for the purpose set forth.

2. In measuring-gages, the combination, with the bar A, having legs *a a'*, of a movable bar B, having two longitudinal slots B E', engaging bolts *e e'*, and near its end a leg *b*, lever G, fulcrumed on the bar A and connected with the bar B by the connecting-rod H, and a suitable dial upon said bar A, as and for the purpose set forth.



3. In measuring-gages, a dial having graduations on both of its faces, in combination with a lever having its fulcrum in the center of said dial, said lever having in its face an opening provided with a pointer and on the back a guard-piece overlapping the edge of said dial, and also provided with a pointer, whereby the graduations on either side of said dial may be used and the lever held in proper position, substantially as described.

4. In measuring-gages, the combination, with the bar A, having two downwardly-projecting legs *a a'* and overhanging bars B E', a dial C, having graduations *c d*, a sliding bar B, having longitudinal slots E E', bolts *e e'*, a downwardly-projecting leg *b*, and overhanging bar *r*, a pivoted lever G, having aperture *g*, provided with a pointer *o* on one side and a guard provided with a pointer *j* on the opposite side, and a connecting-rod H, to connect the stationary bar with the movable bar, all as set forth.

5. In a combined in and out side measuring-gage, the combination, with the bar A, having near one end a Y-shaped fork provided with downwardly-projecting legs *a a'* and overhanging portions B E', and on the other end a sliding bar B, provided with two longitudinal slots E E' and downwardly-projecting leg *b*, and two screw-bolts *e e'*, engaging in said slots and being screwed into said bar A, whereby the said bar B is movably secured to the said bar A, substantially as and for the purpose stated.

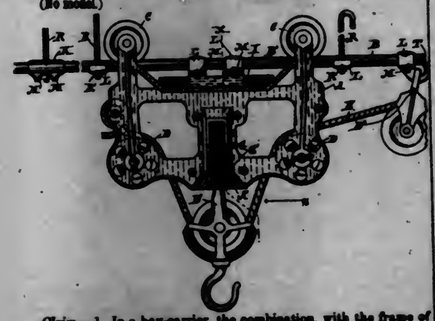
418,780. SUSPENSION DEVICE FOR HANGING LAMPS. LEWIS F. GRISWOLD, Meriden, Conn., assignor to The Charles Parker Company, same place. Filed May 9, 1889. Serial No. 310,119. (No model.)

Claim.—1. In a suspension device for hanging lamps, the combination, with a frame, of three or more rollers mounted therein, a suspension-chain passing over the rollers, so as to be deflected between them, and a counter-balance attached to the chain, substantially as set forth.

2. In a suspension device for hanging lamps, the combination, with a frame of three or more rollers mounted therein, a suspension-chain passing over them, so as to be deflected between them, and a counter-balance attached to one end of the chain, one or more of the rollers being adjustable to change the angle in which the chain is deflected, substantially as set forth.

3. In a suspension device for hanging lamps, the combination, with a frame, of a roller mounted therein, two rollers located outside of the said roller and adjustable in their relations thereto, a suspension-chain passing over the rollers and changed in its deflections by the adjustment of the adjustable rollers, and a counter-balance attached to one end of the chain, substantially as set forth.

4. In a suspension device for hanging lamps, the combination, with a frame, of three or more rollers, mounted therein, a suspension-chain passing over the rollers, so as to be deflected between them, and a counter-balance, one or more of the rollers being adapted to be clamped against rotation to increase the friction between them and the chain, substantially as set forth.

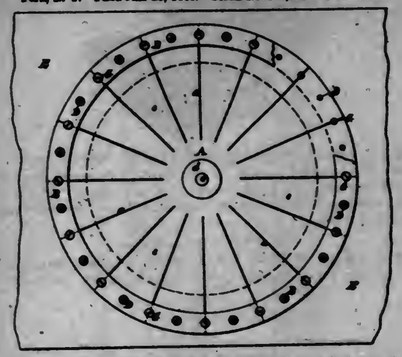


5. In a suspension device for hanging lamps, the combination, with a slotted frame, of three or more rollers mounted therein, a suspension-chain passing over the rollers, so as to be deflected thereby, and a counter-balance attached to the chain, one or more of the rollers being adjustable in the slotted frame to change the deflections of the chain, and hence vary the amount of friction developed, substantially as set forth.

6. In a suspension device for hanging lamps, the combination, with a frame having two slotted arms, of a roller mounted in the said frame, two rollers respectively mounted in the slotted arms thereof and adjustable within the limits of the slots, a suspension-chain passing over the rollers, so as to be deflected thereby, and a counter-balance attached to the chain, substantially as set forth.

7. In a suspension device for hanging lamps, the combination, with a frame, of three or more rollers mounted therein, a suspension-chain passing over the rollers by which it is deflected, and a counter-balance attached to one end of the chain, the said frame being adapted to be sprung to clamp one or more of the rollers against rotation, substantially as set forth.

8. In a suspension device for hanging lamps, the combination, with a frame having two slotted horizontal arms, of two rollers respectively mounted in the said arms and adapted to be adjusted in the limits of the slots therein, a roller mounted in the frame between the said adjustable rollers, a suspension-chain passing over the rollers and changed in its deflections by adjusting the outer rollers, and a counter-balance attached to the chain, substantially as set forth.



418,781. HAY-CARRIER. WILLIAM GUTHEIMER and CHARLES A. GUTHEIMER, Milwaukee, Wis. Filed May 11, 1889. Serial No. 310,417. (No model.)

Claim.—1. In a hay-carrier, the combination, with the frame of the carrier, of a lever G, pivoted at one end in the lower part of the carrier, so as to swing transversely thereof, and having a median projection adapted to engage the head of the tackle, and a lever-latch H, pivoted centrally in the side of the carrier and swinging transversely thereof, the lower end of the lever-latch being adapted to bear movably against the upper end of the lever G, and the upper end of the latch being adapted to impinge and bear laterally against a fixed stop on the track, substantially as described.

2. In a hay-carrier, the combination, with the frame, of a grappling-lever G, so pivoted in the frame as to swing transversely thereof, a spring G', adapted to hold the lever G yieldingly up to its work, and a lever-latch H, pivoted in the frame and bearing at one end against the grappling-lever G and at the other end adapted to engage a stop on the track, substantially as described.

418,782. TELEPHONE-DIAPHRAGM. ALEXANDER W. HALL, New York, N. Y. Filed Jan. 28, 1889. Serial No. 297,512. (No model.)

Claim.—The combination of a diaphragm for a telephone, phonograph, or other instrument divided radially into sections from the periphery toward the center, a pair of clamping-rings and screws therefor common to all the said sections, a circular bearing common to all of said sections, and tension-screws for drawing the clamping-rings over said bearing and so applying tension to all of said sections, substantially as and for the purpose herein set forth.

418,783. UNLOADING ATTACHMENT FOR CARS. JONATHAN S. HARSHMAN, Harshmans, Ohio. Filed Aug. 26, 1889. Serial No. 322,202. (No model.)

Claim.—1. The combination, with a car-body provided with aligned bearings, of a shoveling-board hinged to a rod resting in said bearings, substantially as specified.

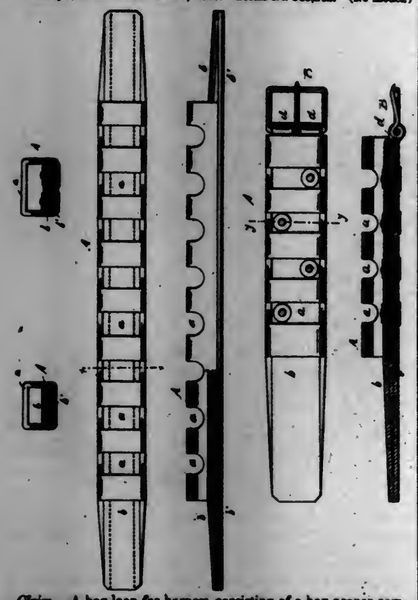
2. The combination, with a car-body having aligned bearings near its upper edge at its end, of a hinged shoveling-board or guide supported by a rod resting in said aligned bearings, substantially as specified.

3. The combination, with a car-body having aligned bearings near its end in its side walls, of a shovel-board provided with a longitudinal sleeve or half-hinge along its upper edge, and a hinge-rod passed through said aligned bearing and sleeve or half-hinge and provided with a head at one end and a threaded portion at the other end, having a securing-nut turned thereon, substantially as specified.

4. The combination, with a car-body having bearings in its side walls, of a shoveling-board provided with a downwardly-turned sleeve along its upper edge, and a hinge-rod having a head and a threaded portion, and a nut turned on the threaded portion of the hinge-rod, substantially as specified.

5. The combination, with a car-body provided with aligned bearings, of a shoveling-board provided with an integral sleeve along its upper edge, and a headed threaded hinge-rod having a securing-nut on its threaded portion, substantially as specified.

6. The combination, with a car-body, of a shoveling-board hinged to one of the walls thereof and adapted to turn within the body, substantially as specified.

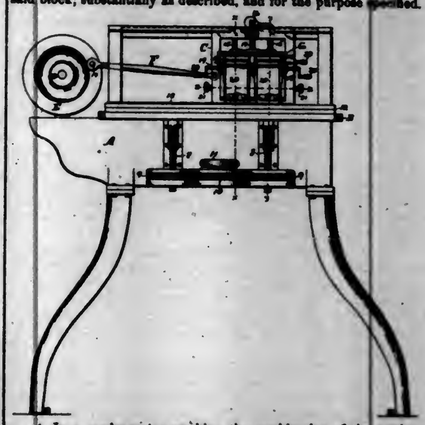


418,784. PAPER BOX. FREDERICK G. HOSSFELD, Brooklyn, N. Y. Filed Oct. 29, 1888. Renewed Sept. 26, 1889. Serial No. 324,956. (No model.)

Claim.—As an improved article of manufacture, a folding box made from paper in one piece and consisting of the rectangular bottom, the sides 2 2, each having a cover-flap 5 on its edge, the side 3, having on its edge the main cover-flap 6, the side 3', having on its

edge the cover-flap 6', and the corner-gussets, each divided by a crease into two plies 4 and 4', the plies 4 being permanently secured to the box sides, which they overlap, said cover-flap 6 being provided with a hook which engages a slit in one side of the box when the box is closed.

413,785. BOX-LOOP FOR HARNESS. RICHARD J. MANNHEIM, Brooklyn, N. Y. Filed June 6, 1889. Serial No. 313,212. (No model.)

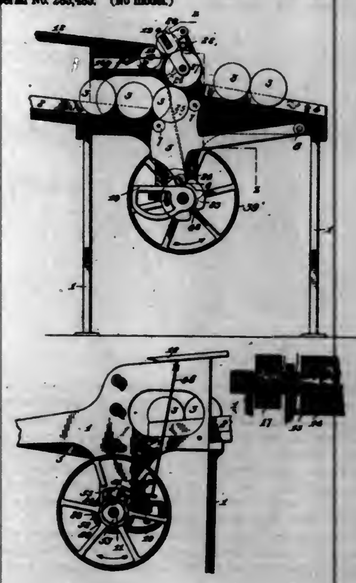


Claim.—A box-loop for harness, consisting of a box proper composed of a single blank in one piece folded longitudinally of itself into box shape and provided with a series of centrally-disposed transverse slots which constitute openings extending across the top and down the sides of the box, in combination with an inner strap and an outer bottom strap, the edges of said box-blank extending between said straps and forming an intermediate layer, and fastening devices uniting said straps, and an intermediate layer disposed on opposite sides of the several top openings of the box, substantially as described.

413,786. SANDPAPERING-MACHINE. HENRY MILLER, Thomaston, Conn. Filed June 6, 1889. Serial No. 313,262. (No model.)

Claim.—1. The combination of a suitable frame, the reciprocating carriage-frame mounted therein, the vertically-movable carriage mounted within said carriage-frame, the paper-carrying rollers and pattern or former-block mounted on said carriage, springs 15, for depressing said vertically-moving carriage, and the cam 16, for lifting the same, substantially as described, and for the purpose specified.

2. The combination of a suitable frame, the reciprocating carriage-frame mounted therein, the vertically-movable carriage mounted within said carriage-frame, the paper-carrying rollers and pattern or former-block mounted on said carriage, springs 15, for depressing said vertically-moving carriage, and the cam 16, for lifting the same, the vertically-adjustable work-bed underneath said carriage, and its adjusting mechanism, substantially as described, and for the purpose specified.



3. In a sandpapering-machine, the combination of a carriage, devices for holding a strip of sand-paper, the attachable and detachable pattern or former-block, shaped in conformity to a portion of said molding, the spring-pressed clip upon one side of said former-block, and the laterally-adjustable bar or roller 26 upon the other side of said block, substantially as described, and for the purpose specified.

4. In a sandpapering-machine, the combination of the carriage having uprights, the pattern or former-blocks fitted between said uprights, and the clamping-rod 24, for adjustably securing said blocks in place, substantially as described, and for the purpose specified.

5. In a sandpapering-machine, the combination of a reciprocating carriage, the rollers 18 and 19, mounted thereon on axes that are parallel to the line of reciprocation of said carriage, a strip of sand-paper having its respective ends secured to said rollers, and a former-block or pattern with the sand-paper passing over its edge, substantially as described, and for the purpose specified.

413,787. MACHINE FOR ATTACHING LABELS. JOHN C. MCBEAN, Rochester, N. Y., assignor of three-fourths to Alexander Ross, Samuel J. Parker, and Burton F. Blackall, all of same place. Filed Aug. 22, 1888. Serial No. 283,483. (No model.)

Claim.—1. In a machine for attaching labels to cans, a can-feeding table, a can-lifting device, and a can-delivery table located above the feeding-table arranged substantially as set forth, whereby a can fed onto the lifting device will be under a can to be fed or dropped onto the delivery-table.

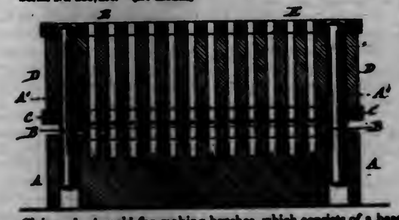
2. In a machine for attaching labels to cans, a can feeding or supplying table, can-elevating mechanism, and can-gripping devices, and a delivery-table located on a higher plane than the supply-table, whereby a can may be fed, lifted, gripped, and then released and passed laterally onto the delivery-table in a plane above the incoming can, substantially as set forth.

3. In a machine for attaching labels to cans, the pivoted lifting-bracket and an inclined table to automatically deliver a can upon the bracket, in combination with a cam for lifting the bracket and can, substantially as set forth.

4. In a machine for attaching labels to cans, the felt roller having yielding journal-bearings, a swinging bracket moving about the axis of the can-grippers, and a cam and connecting-rod, whereby the felt roller is moved back and forth upon the surface of a can held in the grippers, substantially as set forth.

5. In a machine for attaching labels to cans, the combination of the felt roller and its journaled bracket, with the two-part adjustable cam and the intermediate devices, whereby the felt roller can be applied to the ends of labels of unequal lengths, substantially as set forth.

6. In a machine for attaching labels to cans, the cam having two parts, each with portions of its periphery cut away at different points, one part being keyed to the shaft and provided with a slot, and the other part provided with a set-screw, and thereby made adjustable on the fixed part to cause the peripheral portions situated between the cuts or notches to overlap more or less, according to the length of a label to be pasted, in combination with the journaled felt-roller bracket and intermediate devices, substantially as set forth.



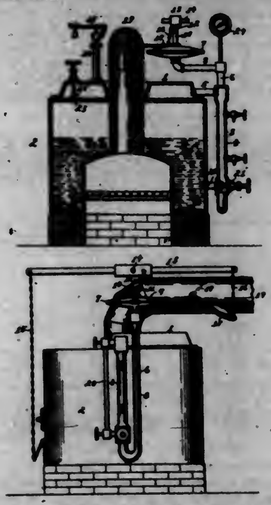
7. In a machine for attaching labels to cans, the combination of the rotary brush, pivoted lever, cord and weight, and the pin on the drive-wheel, whereby the brush is alternately rotated in opposite directions to brush the opposite ends of the label, substantially as set forth.

8. In a machine for attaching labels to cans, the combination of the hinged table with the loose pulley, the main shaft, and clutch mechanism, whereby the table is used to operate the clutch to start the machine, substantially as set forth.

9. In a machine for attaching labels to cans, the combination of the table, loose pulley, shaft, and cranked clutch-piece, with the springs, lever, and intermediate rod, whereby the clutch is operated and the machine started or stopped, substantially as set forth.

10. In a machine for attaching labels to cans, the combination of the felt roller having yielding journal-bearings, with the spring-fingers resting in grooves in the circumference of the felt roller, both roller and fingers being supported in a swinging or journaled bracket, whereby the fingers are kept constantly in the grooves, substantially as set forth.

413,788. MOLDING-BLOCK FOR THE MANUFACTURE OF BRUSHES. LOUIS W. HERSCHEL, New York, N. Y. Filed Jan. 4, 1889. Serial No. 295,690. (No model.)

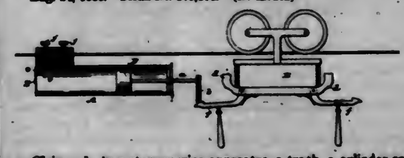


Claim.—1. A mold for making brushes, which consists of a base-block having sockets with enlarged upper ends, a stripping or clearing plate, and a filling-block, the stripping-plate and filling-block being provided with openings in line with the sockets of the base-block, substantially as set forth.

2. A molding-block for making brushes, composed of a base-plate having sockets with enlarged upper ends, a stripping or clearing plate, a filling-block, and a protecting plate or shield above said filling-block, said stripping-plate, filling-block, and protecting-plate being provided with openings in line with the sockets of the base-block, substantially as set forth.

413,789. AUTOMATIC DRAFT-REGULATOR. WILLIAM H. PAGE, Norwich, Conn. Filed Mar. 14, 1889. Serial No. 303,202. (No model.)

Claim.—1. In an automatic draft-regulator, the combination of an exterior tank or reservoir, an elevated diaphragm-chamber above the tank, a vertical siphon-column located exteriorly of the heater or boiler and having its shorter member communicating directly with the tank or reservoir and its longer member with the diaphragm-chamber, substantially as described, and mechanism connected to the diaphragm for controlling the regulating-dampers of the boiler, all arranged and combined for service as herein shown and described, for the purpose set forth.



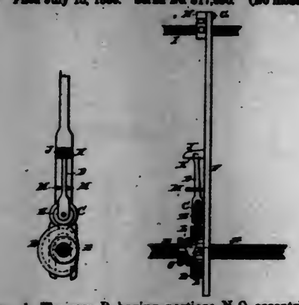
2. In an automatic draft-regulator, the combination of an exterior reservoir or tank, a vertical column or tube communicating with the reservoir and having a valved connection with the water-space of a boiler, and a diaphragm adapted to be operated by an excessive pressure of the fluid contents of the vertical column or tube to control the draft-door of the boiler, substantially as and for the purpose described.

3. In an automatic draft-regulator, the combination of an exterior tank applied laterally to a boiler, a vertical siphon-column arranged laterally of a boiler and one of its members having a valve-connection at its lower end with the water-space of said boiler and communicating at its upper end with the reservoir or tank, an elevated diaphragm-chamber communicating with the upper end of the longer member of the siphon-column, and mechanism connected with a diaphragm for controlling the movement of the draft-door, substantially as and for the purpose described.

4. In an automatic draft-regulator, the combination of an exterior reservoir or tank having a valved connection with the steam-space of a boiler, a vertical siphon-column having its shorter member communicating with the reservoir and by a valved connection with the boiler, an elevated diaphragm-chamber communicating with the upper end of the longer member of the siphon-column, and mechanism connected with the diaphragm for controlling the movement of the draft-door, substantially as described.

413,790. STORE-SERVICE BUFFER. LEROY G. POWERS, Somerville, assignor to the Lamson Cash Railway Company, Boston, Mass. Filed Aug. 24, 1885. Serial No. 173,191. (No model.)

Claim.—1. In a store-service apparatus, a track, a cylinder supported adjacent to the track, and a piston arranged to be moved along the cylinder by a cash-car traveling on the track, and a port arranged to permit a limited escape of the air from the cylinder on the sudden movement of the piston therein and its continued escape thereafter until there is no pressure upon the piston, substantially as described.

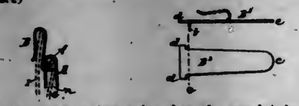


2. The combination, in a buffer for store-service apparatus, of a cylinder, a piston arranged to be moved along the cylinder by the movement of the car to compress the air therein, a port for the con-

tinuous limited escape of the air from the cylinder, and a valve hung to permit the free entrance of the air on the return movement of the piston, substantially as described.

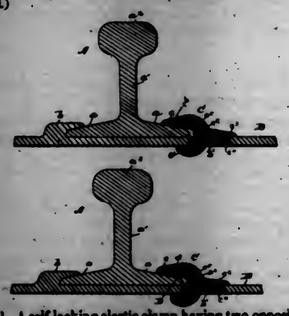
3. The combination, with the way of a store-service apparatus, of a cylinder mounted thereon and provided with a port and valve, and a piston moved by the car and adapted to said cylinder, and provided with a piston-rod extending parallel with the way and carrying a cross-bar for engaging with the car, substantially as described.

4. The combination of a car provided with a catch, a way, and an air-buffer cylinder supported adjacent to the way and provided with a piston, with a piston-rod parallel to the way, a port to permit the escape of air from the back of the piston, and a cross-bar on the piston-rod adapted to be engaged by the catch, substantially as described.



418,791. MECHANICAL MOVEMENT. EMANUEL RAS, New York, N. Y., assignor to the Emanuel Ras Manufacturing Company, same place. Filed July 15, 1889. Serial No. 317,690. (No model.)

Claim.—1. The cam B, having portions N O eccentric to each other, around both of which portions the track L is formed, constructed and arranged to operate substantially in the manner and for the purposes specified.



2. The cam B, having portions N O, the pitman F, cam-roll C, vibrating rod D, lug J, guide-pins M, and shaft A, all combined and arranged to operate substantially as specified.

418,792. GARMENT-SUPPORTING CLASP. FRANK A. RICHARDSON, Worcester, Mass., assignor to Edmund Converse and Ambrose T. Matthews, both of same place. Filed Dec. 15, 1888. Serial No. 293,672. (No model.)

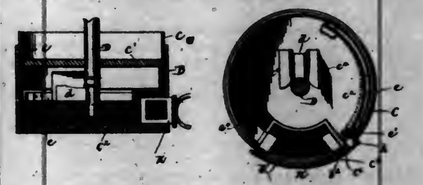
Claim.—In a garment-supporting clasp, the guard A, having the straight horizontally-folded top *f* and the downwardly-extended sides, one of which is slotted, as at *a*, in combination with the part B, having the flange *b*, lateral edrs *d d*, and overhanging hook arranged through the slot *a* in the guard, all substantially as shown, and for the purpose described.

418,793. METALLIC CLAMP. EDWIN R. SHEPARD, New York, N. Y. Filed Jan. 26, 1887. Renewed Mar. 21, 1889. Serial No. 304,233. (No model.)

Claim.—1. A self-locking elastic clamp having two opposing jaws held toward each other with an elastic force, and having also a locking projection adapted, when the clamp is in position, to prevent movement or displacement thereof, substantially as set forth.

2. The herein-described elastic clamp, having two opposing jaws held toward each other with an elastic force and at a distance apart slightly less than the parts which they engage, and having also a flange portion situated in rear of the jaws and adapted to rest upon the face of one of the parts which the clamp unites, whereby the elastic force of the jaws is supplemented and the clamp guided into engagement with the parts which it unites, substantially in the manner set forth.

3. The herein-described spring or elastic clamp, having the longer upper jaw *c*, the shorter lower jaw *c'*, the shank portion *c²*, and the rearward-projecting flange portion *c³*, rabbeted to form the locking projection *c⁴*, substantially as set forth.



4. In combination with the rail A, having the flanges *a*, and the tie B, perforated at *b'* and having the lugs *b*, against which the flanges *a* bear laterally, the clamp C, adapted to lie in said perforation *b'* and having jaws *c* and *c'*, the shank portion *c²* of the clamp between the jaws and opposite the flange *a* being chambered out, as at *c³*, whereby any lateral or sidewise thrust of the rail will not be directly against the shanks of the clamps, but will be borne by the lugs *b*, substantially as set forth.

5. In combination with the parts A and B and the clamp which unites them, a lining D, interposed between the clamp and said parts, substantially as set forth.

6. In combination with the parts A and B and the clamp which unites them, a lining of elastic material, of a form substantially conforming to the interior of the clamp, interposed between said parts and the clamp, substantially as set forth.

7. A metallic clamp having two opposing jaws adapted to engage with opposite faces of the parts which it unites, one of the jaws being cut away upon its inner face, whereby there is left a bearing-face, as at *c³*, near the end of the jaw, substantially as set forth.

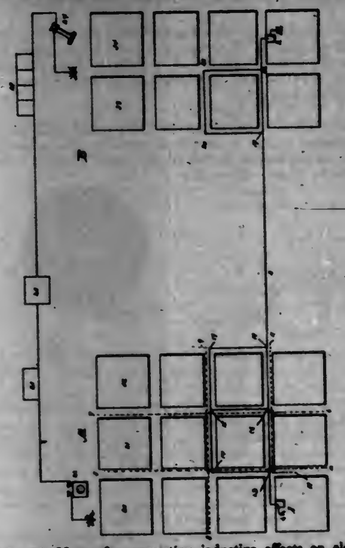
418,794. LOCK. CLARENCE M. STEBBINS, New York, N. Y. Filed Apr. 23, 1888. Serial No. 308,309. (No model.)

Claim.—1. In combination with a lock-holder, a lock which may be embraced by the said holder, but which is removable therefrom, a keeper, and a key adapted to operate said lock to lock the keeper, holder, and lock together, for the purpose described.

2. A lock provided with a bolt and with a catch to prevent the movement of the bolt, in combination with a lock-holder in which the lock is placed, and a keeper provided with an attachment for releasing the bolt, substantially as described.

3. A lock provided with a bolt and with a catch to prevent the movement of the bolt, in combination with a lock-holder embracing the lock and provided with an opening, a keeper adapted to pass through or into said opening to become engaged with the lock, and an attachment upon said keeper for releasing the bolt, substantially as described.

4. A lock, in combination with a lock-holder which embraces the lock, said holder being provided with an opening, and a keeper adapted to pass through or into said opening to become engaged with the lock.

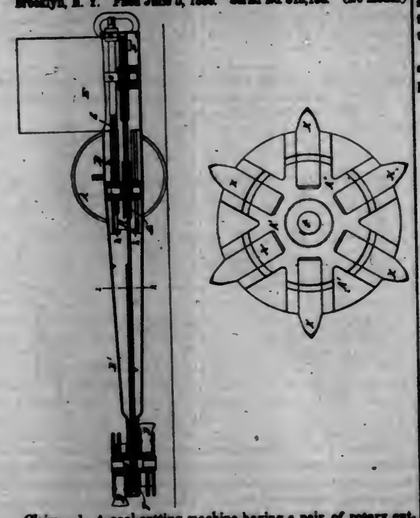


5. The combination, with a lock and key, of a holder for the lock, a keeper engaging with the lock-bolt to hold the lock, holder, and keeper together, and mechanism operating on the withdrawal of the keeper when it is unlocked to prevent the removal of the key from the lock, as described.

6. A portable lock constructed to retain or hold the key while the bolt is withdrawn, in combination with the key, a stationary lock-holder, and a keeper adapted to be locked to the lock when the bolt is thrown by the turning of the key.

7. A lock provided with a bolt, and a latch for holding the bolt in its withdrawn position, in combination with a keeper provided with a releasing device for releasing said bolt and allowing it to be turned when the keeper is brought into position to be locked to the lock.

8. The combination, with a key, of a lock, a bar to the removal of the key from the lock while the bolt is in the withdrawn position, a catch for holding the bolt in its withdrawn position, and a keeper provided with a device for releasing the bolt when the keeper is brought into position to be locked to the lock.

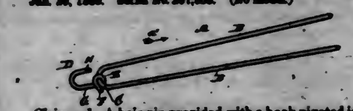


418,795. ANTI-INDUCTION SYSTEM. JOHN G. BOSKOWELL, Burlington, Kans., and ALBERT BARRETT, Kansas City, Mo. Filed Feb. 26, 1889. Serial No. 301,208. (No model.)

Claim.—1. Means for preventing inductive effects on electric signaling-lines, consisting of a shunt or loop in closed relation to the line in the neighborhood of inductive disturbance, the return-circuit for the line being out of inductive range of the disturbing source.

2. Means for preventing inductive effects on electric signaling-lines, consisting of a closed shunt or loop around the source of disturbance, only part of said loop lying in inductive proximity to the disturbing source.

418,796. COAL-CUTTING MACHINERY. WILLIAM H. STEBBINS, Brooklyn, N. Y. Filed June 5, 1889. Serial No. 313,188. (No model.)



Claim.—1. A coal-cutting machine having a pair of rotary cutters and driving mechanism therefor, and having the frame in the form of a closed box entirely inclosing the driving mechanism, and an axis passing through the outer end of the box and carrying within the latter a wheel to receive the driving-power, while on the outside the axis carries the two rotary cutters.

2. The combination of the motor of a coal-cutting machine with driving mechanism and the frame in the form of a closed box inclosing the motor and the mechanism for transmitting motion from the motor, and an axis passing through the outer end of the box and carrying within the latter a wheel to receive the driving-power, while on the outside the axis carries two rotary cutters.

3. The combination of a coal-cutting machine having its entire frame in the form of a closed box, a vertical driving-shaft, and pulley at one end of the frame, with a vertical axis passing through the outer end of the frame and carrying within the latter a pulley and carrying rotary cutters outside the frame, and an endless rope transmitting motion from one pulley to the other, the said frame inclosing the rope and pulleys, all substantially as described.

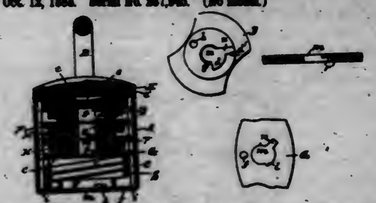
4. The combination of the frame of a coal-cutting machine having a motor, driving-shaft, and wheel, with a vertical axis having a central wheel, a pair of rotary cutters, and an endless rope passed twice around both of said wheels, and an adjustable idler-pulley around which the rope is also passed, all substantially as set forth.

418,797. HAIR-PIN. CHARLES WALSH, Brooklyn, N. Y. Filed Jan. 30, 1889. Serial No. 297,893. (No model.)

Claim.—1. A hair-pin provided with a hook pivoted in the middle or bent portion thereof, substantially as shown and described.

2. A hair-pin comprising an ordinary hair-pin, a hook pivoted in the middle or bent part thereof, and a lug formed on the said hook for conveniently closing and opening the hook, substantially as shown and described.

418,798. INK-ERASER. MCCLINTOCK YOUNG, Frederick, Md. Filed May 16, 1889. Serial No. 311,044. (No model.)



Claim.—1. An ink-eraser consisting of the pliable strip coated with abrasive material and a holder or support to which the strip is adjustably secured.

2. The combination of a flexible strip coated with abrasive material, a holder or support having a convex surface, over which the strip is passed and by which it is supported, a confining-band, substantially as shown, acting to hold the strip in place to permit its longitudinal adjustment.

3. A rubber block or support, the flexible strip coated with abrasive material and applied to said block, and the clasp or band C, applied as shown and described.

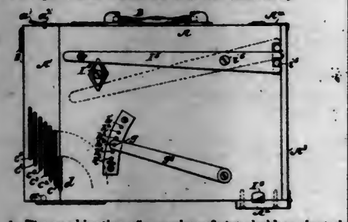
418,799. PADLOCK. JACOB B. ANWAKE, Lancaster, Pa., assignor to Miller W. Frahn and Edward T. Frahn, both of same place. Filed Oct. 12, 1888. Serial No. 287,965. (No model.)

Claim.—1. The combination, with the case, of vertically-movable plates secured therein provided with projections upon their bearing-surfaces, and rotary tumblers resting upon said plates, having indentations formed therein adapted to register with the said projections when the tumblers occupy certain positions, substantially as and for the purpose specified.

2. The combination, with the case, of a series of stationary plates having centrally-located openings through them, and rotary tumblers provided with annular flanges or ribs upon their upper and lower faces adapted to engage in the openings in the stationary plates between which they rest, the upper tumbler-bearing in the case being provided with a recess to receive the annular flange on the upper surface of the adjacent tumbler, substantially as and for the purpose specified.

3. In a padlock, the combination of the stationary plates provided with openings, and rotary tumblers having projections or ribs

on their upper and lower faces adapted to be held in continuous engagement with the openings in the plates between which they rest, so that the entire series of plates and tumblers may be connected together, substantially as and for the purpose specified.

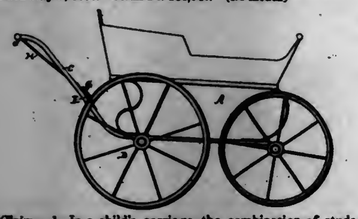


413,800. RAILWAY-SIGNAL. ROBERT BLACK and CORNELIUS M. HAVEY, New York, N. Y., assignors to the Black Automatic Railway Block Signal Company, same place. Filed May 13, 1889. Serial No. 310,513. (No model.)

Claim.—1. The combination, with the signal and the rail-bars and connections for moving the same, of the springs 5 and 13 and the rods for the same for pressing the rail-bar against the side of the track-bar and for allowing the rail-bar to yield laterally when the train is going in one direction, substantially as set forth.

2. The combination, with the pivoted rail-bar and the connections from the same to the signal, of the frame Y, the yielding angle-iron 10, the rod 8, and spring 13, for pressing the angle-iron against the rail-bar and for allowing such rail-bar to yield laterally, substantially as and for the purpose set forth.

413,801. PHOTOGRAPHIC CAMERA. CHARLES W. EDDY, Ware, Mass. Filed Sept. 1, 1888. Serial No. 284,316. (No model.)



Claim.—1. The combination of a number of plate-holders pivoted in place at different levels at their lower ends, so as to be capable of swinging forwardly into a horizontal or rearwardly into a vertical position, substantially as specified.

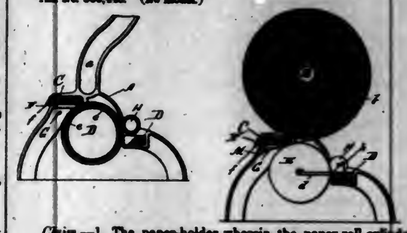
2. The combination of a number of plate-holders respectively pivoted in place at their lower ends at different levels, and a front cover therefor also pivoted in place on a pivot-rod journaled in the box, substantially as specified.

3. The combination of a number of plate-holders respectively pivoted in place at their lower ends and having arms on the ends of their pivots serving as handles, substantially as specified.

4. The combination of a number of plate-holders pivoted in place at their lower ends and having arms on the ends of their pivots serving as handles and as catches for retaining them in position, substantially as specified.

413,802. CHILD'S CARRIAGE. WASHINGTON JOHNS, Lancaster, Pa. Filed July 9, 1889. Serial No. 316,947. (No model.)

Claim.—1. In a child's carriage, the combination of studs projecting from the sides of the wheels, and a brake adapted to engage said studs, substantially as specified.



2. The combination, with the brake constructed to engage and lock the wheels, of cords connecting the brake and propeller-bar, the propeller-bar journaled in the handles C, and a handle *a*, adapted to revolve the propeller-bar in its journals and wrap the cords around it to disengage the brake from the wheels, substantially as specified.

3. The combination, with the wheels provided with studs *d*, of the brake constructed to engage said studs, connections between the brake and propeller-bar, and the propeller-bar adapted to disengage the brake from the studs, substantially as specified.

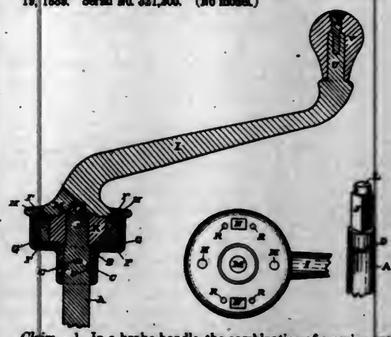
4. In a child's carriage, the combination, with the propeller-bar journaled in the handles thereof, of a brake movably secured to the handles and provided with notches adapted to take over the rims of the wheels, studs *d* on the rims of the wheels, and cords connecting the brake and propeller-bar, substantially as and for the purpose specified.

5. In a child's carriage, the combination, with a brake constructed to slide up and down on the handles and hold in engagement with the wheels by gravity, of staples, in which the brake slides, secured to the handles, and connections for disengaging the brake from the wheels, substantially as specified.

413,803. PAPER PRINTING AND CUTTING HOLDER. GUY L. KENNEDY, Chicago, Ill., assignor, by mesne assignments, to the Merchants Roll Paper Supply Company, same place. Filed May 3, 1889. Serial No. 309,446. (No model.)

Claim.—1. The paper-holder wherein the paper-roll cylinder is provided with curved or inclined long slot bearings, and combined with a cross-bar against which the periphery of the paper rests, and which is located at that side of the bearings which is opposite the side upon which the bearings are inclined, substantially as set forth.

2. The paper-holder wherein are combined a paper-roll cylinder revolving in long slot bearings, a cross-bar upon which the paper rests, and a printing-roller, substantially as set forth.



3. The paper-holder wherein are combined the paper-roll cylinder revolving in long slot bearings, a cross-bar upon which the paper rests, and a printing-roller revolving in contact with said bar, substantially as set forth.

4. The printing-paper holder consisting of side standards having open slot bearings for the paper-cylinder, the paper-cylinder revolving in said bearings, the cross-bar carrying the knife, and a printing-roller rotating in contact with said cross-bar, substantially as set forth.

5. The combination, in a paper-roll holder, of a printing-roller having fixed bearings, and a stationary bar against which the roller rotates, the roller having a rubber type-plate, substantially as set forth.

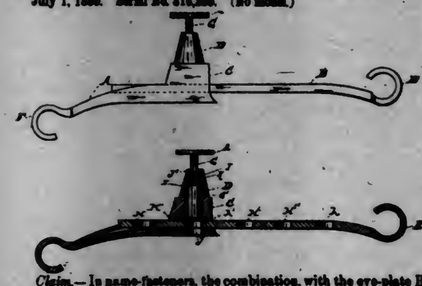
6. The paper-holder wherein the paper-roll cylinder is provided with slotted bearings, and combined with a tension-producing support located below and wholly at one side of the bearings, substantially as specified.

413,804. BRAKE-HANDLE. JOHN KIRBY, Jr., Dayton, Ohio, assignor to the Dayton Manufacturing Company, same place. Filed Aug. 19, 1889. Serial No. 321,305. (No model.)

Claim.—1. In a brake-handle, the combination of a casing rotatably mounted upon the brake-rod, a ratchet-wheel mounted within the casing and engaging the brake-rod, one or more pawls adapted to engage the ratchet-wheel, and a brake-handle secured to the casing and designed to operate the same.

2. In a brake-handle, the combination of a casing rotatably mounted upon the brake-rod, a ratchet-wheel mounted within the casing and removably fitted upon the brake-rod, one or more pawls adapted to engage the ratchet-wheel, and a brake-handle adapted to fit over the casing, hold the various parts mounted therein in place, and operate the said casing.

3. In a brake-handle, the combination of a casing rotatably mounted upon the brake-rod and having recesses formed therein, a brake-handle adapted to be secured to the casing and having recesses similar to those in the casing, pawls having pintles adapted to engage the recesses, and a ratchet-wheel adapted to be engaged by the pawls.



4. In a brake-handle, the combination of a casing rotatably mounted upon the brake-rod, ratchet mechanism mounted therein, inward-extending lugs formed on the interior of the said casing, and a brake-handle having downward-extending lugs adapted to fit between the lugs in the casing.

5. In a brake-handle, the combination of a brake-rod having a circumferential groove, a casing fitting on the brake-handle and having pins or screws adapted to engage the said groove, ratchet mechanism mounted within the casing, and a brake-handle for operating the casing.

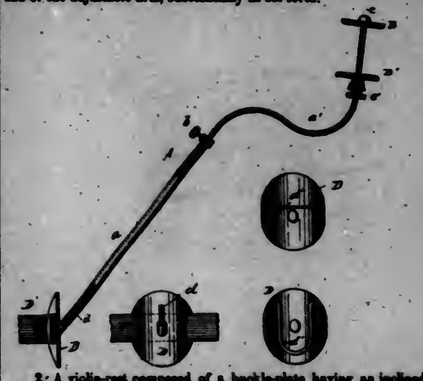
6. In a brake-handle, the combination of a casing rotatably mounted upon the brake-rod, a ratchet-wheel mounted within the casing and engaging the said brake-rod, one or more pawls also mounted within the casing and adapted to engage the ratchet-wheel, the said pawls and ratchet-wheel moving in the same plane, and a brake-handle adapted to operate the casing.

7. In a brake-handle, the combination of a casing rotatably mounted upon the brake-rod, ratchet mechanism carried by the casing, a brake-handle secured to the casing, the upper end of which is reduced, a revoluble hand-piece mounted upon the reduced portion, and means for holding the hand-piece in place.

413,805. HAME-FASTENER. JOHN KERSER, Buffalo, N. Y. Filed July 1, 1889. Serial No. 316,226. (No model.)

Claim.—In hame-fasteners, the combination, with the eye-plate B, having a hook E and a series of holes H H' H'' *h h'*, of the head A, having the hook F and lug C and upward projection D, provided with a central passage J', having enlargements J *j*, within which is located a shoulder-pin G, provided with a head *d* and a spring *k*, the horizontal passage K, and ways *e e'*, as shown and described.

413,806. LIQUID-COOLER. FREDERICK T. KERN, Buffalo, N. Y. Filed Aug. 27, 1888. Serial No. 283,907. (No model.)

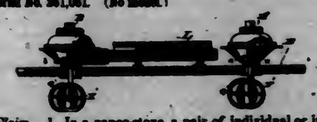


Claim.—1. In a liquid-cooler, the combination, with a series of vats, of a series of tubular coils suspended therein from a horizontal or substantially horizontal pipe, each coil having an open passage at one end thereof leading to and through the pipe and at the other end a two-way cock for opening or closing the passage either through the coil or through the pipe, whereby any coil in the series or the whole number of coils may be brought into action, or any one coil may be shut off without interfering with the action of the other coils, substantially as described.

2. A liquid-cooling device consisting of a coil of pipe having its two vertical ends connected to and communicating with a horizontal pipe, and a means consisting of a stop cock or valve for opening the passage through the coil and closing it through the horizontal pipe at the same point, so that the fluid may pass around through the coil and through the horizontal pipe beyond the valve, or closing the passage in the coil and opening the passage through the horizontal pipe, substantially as described.

413,807. VIOLIN-REST. MANUEL LEDERER and CARL VERITY, Brooklyn, N. Y. Filed May 11, 1889. Serial No. 310,268. (No model.)

Claim.—1. A violin-rest composed of a buckle-plate, an inclined supporting-pin on the buckle-plate, a supporting arm or standard formed of a lower tubular and an upper curved part, means for adjusting the upper part of the arm, and clamping-plates on the upper end of the adjustable arm, substantially as set forth.



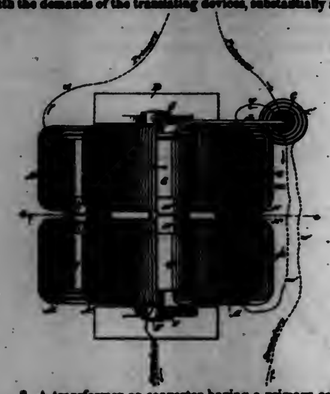
2. A violin-rest composed of a buckle-plate having an inclined supporting-pin, means for attaching said buckle-plate to the body, and a supporting-arm formed of a lower tubular part and an upper curved part, a clamping-screw for connecting said parts, and clamping-disks applied on the upper threaded end of the adjustable part of the arm, and a nut for tightening said disks on the violin-body, substantially as set forth.

413,808. PROCESS OF LEACHING ORES. JOHN S. MAC ARTHUR, Pollokshields, County of Renfrew, Scotland. Filed Sept. 4, 1888. Serial No. 284,552. (No specimens.)

Claim.—The process herein described of treating ores containing oxides or carbonates of earth metals, said process consisting in first subjecting such ores to the action of a proportionate quantity of a solution of a ferrous salt or a bisulphate of an alkali to combine with the oxides or carbonates of earth metals, and then treating the ores with an acid or salt to obtain the contained metals, all substantially as described.

413,809. AUTOMATIC HEATING AND LIGHTING DEVICE FOR VAPOR-STOVES. JAMES A. MARSH, Cleveland, Ohio. Filed Jan. 16, 1888. Serial No. 261,081. (No model.)

Claim.—1. In a vapor-stove, a pair of individual or independent generating-burners and pipes or tubes leading to each burner to supply oil thereto, in combination with two pipes arranged between said burners, one of said pipes serving to heat one burner from another and the other to light one burner from another, said pipes situated one above the other, and the heating pipe or tube perforated to supply vapor to the lighting pipe or tube, substantially as set forth.



2. In a vapor-stove, two individual self-generating burners and pipes to supply oil to each burner separately, in combination with two other pipes situated between the said burners and apart from the burner-cones at both ends, said pipes located one above the other, and the lower pipe serving to heat and the upper pipe serving to light one burner from another, substantially as set forth.

3. In a vapor-burner stove, two burners having independent oil-supply, in combination with a heating-tube having both ends open to the outer air, one end in proximity to a burner and the other burner provided with a coupling at its side having a jet-orifice for the escape of vapor into the end of the tube, and suitable mechanism for holding said tube in a rigid position, substantially as and for the purpose specified.

413,810. TRANSFORMER OR CONVERTER FOR ALTERNATING ELECTRIC CURRENTS. LEONARD PAGE, New York, N. Y., assignor of one-half to Charles J. Kintner, same place. Filed Feb. 12, 1889. Serial No. 299,642. (No model.)

Claim.—1. A transformer or converter having a primary coil connected in circuit with a source of electrical energy and a secondary coil connected in circuit with one or more translating devices, with

means located directly in one leg or branch of the secondary circuit for regulating the energy required in the primary circuit in accordance with the demands of the translating devices, substantially as described.

2. A transformer or converter having a primary coil and a secondary coil, the latter including in its circuit one or more translating devices, with electro-magnetic means located directly in one leg or branch of the secondary circuit for regulating the energy required in the primary circuit in accordance with the demands of the translating devices in use, substantially as described.

3. A regulator for transformers or converters, consisting of primary and secondary coils, including, respectively, the current-source and translating devices, in combination with means located in one leg or branch of the secondary circuit for automatically varying the magnetic condition of the converter-core in accordance with the demands of the translating devices, substantially as described.

4. A regulator for transformers or converters, consisting of primary and secondary coils, including, respectively, the current-source and translating devices, in combination with an adjustable armature for changing the magnetic condition of the converter-core, and means under the control of the translating devices, located in one leg or branch of the secondary circuit, for effecting this change in accordance with the current demands of the translating devices, substantially as described.

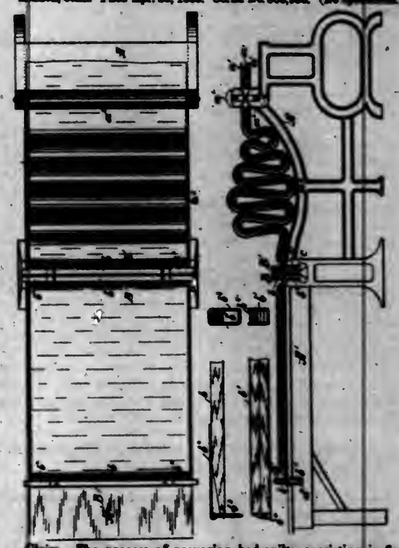
5. A regulator for transformers or converters wherein current-impulses are transformed from a primary to a secondary system, consisting of one or more fixed coils located in the secondary circuit and having fixed cores, with one or more movable primary coils having a movable core, the poles of which are located in close proximity to the poles of the secondary core, substantially as described.

6. A regulator for use in a system of converters or transformers wherein primary currents in one circuit of electricity are converted into secondary currents in a second circuit, consisting of one or more fixed coils located in the secondary circuit, with translating devices, said coils being wound about a fixed core or cores, in combination with one or more movable coils wound about a movable core or cores, and included in the primary circuit, in combination with two solenoids, one located in the primary and the other in the secondary circuit, the one surrounding the other, with mechanical connections between one of said solenoids and the rotary coils, whereby the relative location of the poles of said coils is varied in accordance with the current demands in the secondary circuit, substantially as described.

7. A transformer or converter having core-pieces made of two parts, one of said parts constituting the core for the primary and the other the core for the secondary of said transformer, the poles of said primary and secondary being adjustable with relation to each other, whereby the magnetic circuit of said transformer or converter may be adjusted for maximum or minimum effect, substantially as described.

8. A core for a transformer, consisting of a thin sheet of magnetic material having projecting pole-pieces located at stated intervals, the whole being wound, as described, in spiral form, so that the pole-pieces constitute shoulders against which the coils rest when wound in place, substantially as described.

9. A converter consisting of a fixed secondary magnet, in combination with a movable primary magnet, said magnets having cores or pole-pieces adapted to slide past each other, substantially as described.



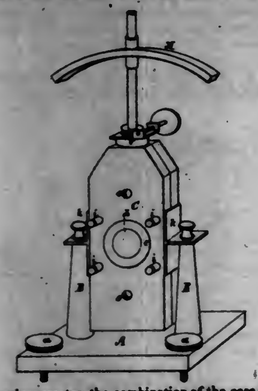
10. A converter consisting of a fixed secondary magnet and a movable primary magnet, said magnets having cores lying in close proximity to each other, in combination with means for causing said poles to vary their magnetic relations, substantially as described.

11. A converter consisting of a series of secondary coils wound upon a fixed circular core having internally-projecting pole-pieces, in combination with a series of primary coils wound upon a similar movable core having internally-projecting pole-pieces, which are adapted to slide past the first-named pole-pieces, and a magnetic axle joining said core-pieces, with mechanical connections, as described, and a pair of solenoids located, respectively, in the primary and secondary circuits, one of said solenoids being attached to the mechanical connections which move the movable coils, substantially as described.

12. A transformer or converter having a primary coil connected in circuit with a source of electrical energy, and a secondary coil connected in circuit with one or more translating devices, with means, also located in the secondary circuit, but in one leg or branch only thereof, for regulating the energy required in the primary circuit in accordance with the demands of the translating devices in the secondary circuit, substantially as described.

13. A transformer or converter having its primary coil connected in circuit with a source of electrical energy and its secondary coil connected in multiple-arc circuit with two or more translating devices, in combination with an electro-magnet or solenoid, also located in the secondary circuit, but in series with the multiple-arc translating devices and connections, as described, the whole being arranged for regulating the energy required in the primary circuit in accordance with the demands of the translating devices in the secondary circuit.

413,811. PROCESS OF PREPARING BED-QUILTS FOR SEWING. WILLIAM H. PALMER, Jr., Norwich, assignor to Palmer Brothers, New London, Conn. Filed Apr. 20, 1889. Serial No. 308,093. (No specimens.)



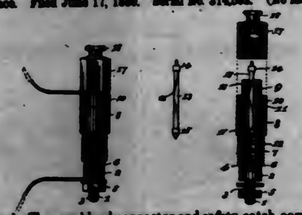
Claim.—The process of preparing bed-quilts, consisting in first sewing the material of which the bed-quilt is to be composed along its side edges, then measuring off a sufficient quantity of such material for a quilt, then where the quilt is to be cut off compressing the material upon both sides throughout its width in parallel lines extending at right angles to the length of the goods, so that a space will be left between said compressions, and subsequently severing the goods between said compressions, whereby both the ends of the quilt so severed and the end of the material remaining will be maintained under compression after severing, substantially as specified.

413,812. GALVANOMETER. ANDREW M. HYDE, Brooklyn, Assignor to Himself and Edward Weston, Newark, N. J. Filed Jan. 12, 1889. Serial No. 296,788. (No model.)

Claim.—1. In a galvanometer, the case C, formed in two parts, each part provided with the cavities *b* and *g*, recesses *h*, and hole *d*, the rabbet *f*, inclined at top and connecting said hole and cavities, all arranged and constructed essentially as shown and set forth.

2. In a galvanometer, the case C, formed in two parts, each provided with the cavities, the recesses, and hole, and rabbeted, as shown, combined with the brackets supporting said case, essentially as described and represented.

3. In a galvanometer, the combination of the case C, formed in two parts, each provided with the cavities, the recesses, and hole, and rabbeted, as shown, with the coils *c*, the plugs *n*, sustaining said coils within the cavities *b* and secured to the case, all as shown and set forth.



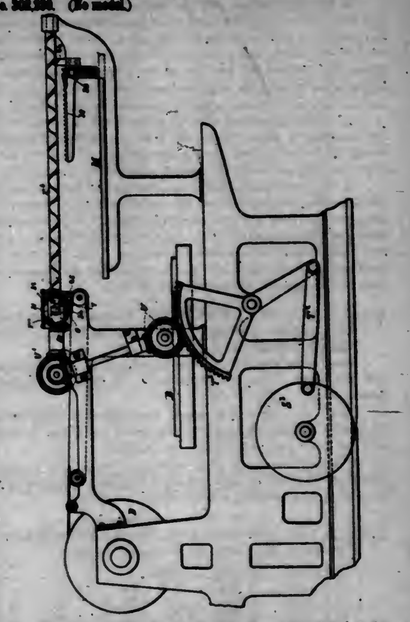
4. In a galvanometer, the combination of the case C, constructed in two parts, each part recessed, provided with cavities and holes, and rabbeted, as shown, with the coils *c*, the plugs *n*, secured to the case and supporting the said coils within the cavities *b*, and the pole-caps *i*, all as shown and set forth.

5. In a galvanometer, the combination of the case C, constructed in two parts, each part recessed, provided with cavities and hole, and rabbeted, as shown, with the coils *c*, having apertures *m*, the plugs *n*, secured to the case and supporting the said coils within the cavities *b*, the pole-caps *i*, the plate *p*, sliding pin *r*, sustaining fiber *s*, needles *t*, and reflecting-mirror *u*, all essentially as shown and set forth.

6. In a galvanometer, the combination of the case C, formed in two parts, each part recessed, provided with cavities and hole, and rabbeted, as shown, said case sustaining the coils *c*, and pole-caps *i*, with the cap and tube *v'*, plate *p*, and sliding pin *r'*, for supporting the fiber *s*, which sustains the needle system, all as shown and set forth.

7. In a galvanometer, the combination of the case C, formed in two parts, each part recessed, provided with cavities and hole, and rabbeted, as shown, and sustaining the coils *c*, and pole-caps *i*, with the tube *v'*, supported by the case and provided with the plate *p*, and sliding pin *r*, for supporting the fiber *s*, sustaining the needle system, the tube T, surrounding the tube *v'*, resting on the case and carrying the adjusting-magnet M, with said magnet, all as shown, and essentially as set forth.

413,813. COMBINED BINDING-POST AND THERMAL CUT-OUT. HOWARD C. ROSE, Brooklyn, N. Y., assignor of one-half to John G. Reilly, same place. Filed June 17, 1889. Serial No. 314,592. (No model.)



Claim.—1. The combined connector and safety-catch comprising two metallic binding-posts insulated from each other, but rigidly in line, and a non-conducting fuse-carrier having metal tips connected by a fusible strip and held between said posts by a spring at one end and at the other by a removable abutment-screw passing through one of said posts in line with the fuse-carrier.

2. The combined connector and safety-catch comprising a sleeve of insulating material interposed between two metal binding-posts and forming a rigid structure therewith, a metal spring in contact with one binding-post, a removable abutment projecting from the other, and a non-conducting fuse-carrier having metal tips connected by a fusible strip placed between said spring and abutment.

3. The combined binding-post and safety-catch comprising, in combination, the shank 1, provided with clamping devices, spring 11, tubular nipple 9, insulated fuse 16, screw-cap 17, and pressure-screw 18, adapted to force the fuse 16 against the spring 11 and compress the latter, said shank 1 and nipple 9 being held in fixed position in a solid insulating material.

413,814. SHEET-DELIVERY APPARATUS FOR PRINTING-PRESSES. WALTER SCOTT, Plainfield, N. J. Filed Mar. 7, 1889. Serial No. 302,399. (No model.)

Claim.—1. The combination, with the grippers 6 and 7 and the cross-bar N and its end bearings, of screws or their equivalents for reciprocating the bearings, the cross-bar and parts carried by the same, the table M, upon which the sheets are delivered, a stop for opening the grippers, and mechanism, substantially as specified, for raising the grippers to clear them from the sheet laid upon the table, substantially as set forth.

2. The combination, with the cross-bar N and screws r^4 or their equivalents for reciprocating such cross-bar N, of the grippers 6 and 7, the cross-shaft 21 for the grippers 7, a spring for closing the grippers, an arm and catch for holding the grippers when open, and a gear and rack for giving to the cross-bar N and parts connected therewith a rotary or partial rotary movement after the grippers have been opened for dropping the sheet, substantially as set forth.

3. The combination, with the cross-bar N, of bearings at the ends of such cross-bar and screws or their equivalents for reciprocating the bearings and cross-bar, grippers carried by the cross-bar, a gear and rack for revolving or partially revolving the cross-bar N and grippers, and a roller and spring acting in a recess to steady the cross-bar and grippers and prevent them revolving during the time that the sheet is carried by the grippers, substantially as set forth.

4. The combination with the cross-bar N and the bearings r^4 and mechanism for reciprocating such bearings and carrying the cross-bar laterally above the sheet-delivery table, of the grippers 6, the shaft 21, and grippers 7, the arm and catch 22, the spring-latch 23, for holding the grippers open, the interrupted gear 31, the rack 30, the starting-latch 33, and the projection 34, against which the starting-latch operates to give to the interrupted gear a partial revolution at the commencement of the return movement of the grippers, substantially as and for the purposes set forth.

5. The combination, with the grippers for conveying the sheet along above the delivery-table, of the stationary guide-plates between which the sheet is passed to the grippers, substantially as set forth.

6. The combination, with the reciprocating gripping mechanism for seizing and delivering sheets, of the delivery-table and an adjustable support near each end of the table for raising or lowering one or both ends and inclining the table, substantially as specified.

7. The combination, with the sheet-delivery table, of a support near one end of the table, and a rack and pinion near the other end of the table to raise or lower the same, substantially as set forth.

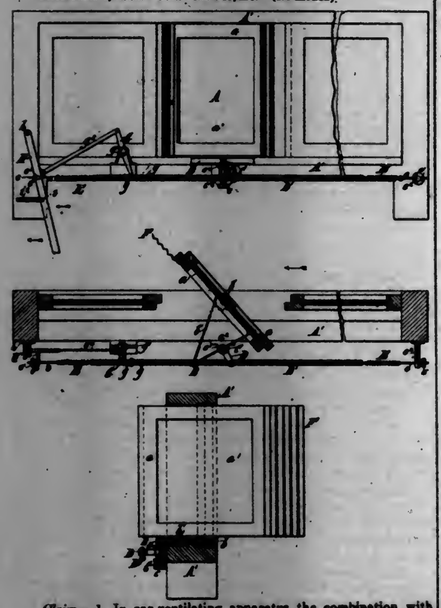
8. The combination, with the grippers and their cross-bar, of nuts for receiving the ends of the cross-bar, screws for actuating such nuts, and gearing for revolving the screws first in one direction and then

the other and reciprocating the gripper-bar and parts connected therewith, substantially as set forth.

9. The combination, with the sheet-delivery table, the grippers, and cross-bar carrying the same, of supports for the ends of the cross-bar, screws or their equivalents occupying a fixed position for supporting and reciprocating the cross-bar laterally above the table, and means for varying the position of the grippers in relation to their supports and raising the grippers above the path of the sheet on the return movement of such grippers, substantially as set forth.

10. The combination, with the grippers and the cross-bar carrying the same, of a gear-wheel and rack for rotating or partially rotating the cross-bar and moving the grippers away from the sheet after the grippers have been opened, substantially as set forth.

11. The combination, with the cross-bar and its end bearings, of the screws or their equivalents for reciprocating the same laterally, grippers connected with and carried by the said cross-bar, and mechanism, substantially as set forth, for giving to the cross-bar a rotary or partially rotary movement in its bearings during the return movement and between the dropping of one sheet and the grasping of the next by the grippers, substantially as set forth.

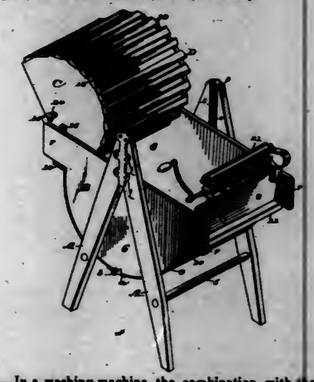


413,815. MOLD FOR CASTING. FRANCIS D. TAYLOR, Brockville, Ontario, Canada. Filed Apr. 3, 1889. Serial No. 305,758. (No model.) Patented in Canada May 4, 1889, No. 31,254.

Brief.—The parts of the mold are shaped by hydraulic pressure and then dried. They are supported in the flask by a backing of molding-sand.

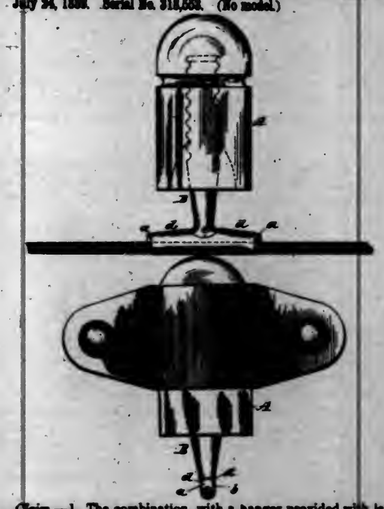
Claim.—1. As a new article of manufacture, a lining for molds for casting metal, composed of a mixture of pulverized peroxide of iron and wood pulp, substantially as described.

2. A mold composed of an inner shape formed of a mixture of pulverized peroxide of iron and wood pulp and a backing of molding-sand or like material, substantially as described.



413,816. CAR-VENTILATOR. OLIVER H. TAYLOR, Brooklyn, N. Y. Filed June 7, 1889. Serial No. 313,426. (No model.)

Claim.—1. In car-ventilating apparatus, the combination, with a swinging ventilator, of an automatically-operating opener acting to always swing said ventilator in a direction to open it, said opener consisting of a reciprocating part connected to said ventilator, and a resistance device, substantially such as described, acting on said reciprocating part, said ventilator being moved in a direction to close it by exterior currents of air against the resistance offered by said resistance device, substantially as specified.

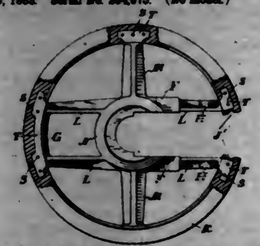


2. In car-ventilating apparatus, the combination, with a swinging ventilator, of an automatically-operating opener acting to always swing said ventilator in a direction to open it, said opener consisting of a reciprocating part connected to said ventilator, a resistance device, substantially such as described, acting on said reciprocating part, and a stop for said opener, said ventilator being moved in a direction to close it by exterior currents of air and against the resistance offered by said resistance device, substantially as specified.

413,817. WASHING-MACHINE. DANIEL B. WAGNER, Carey, Ohio. Filed Apr. 9, 1889. Serial No. 306,496. (No model.)

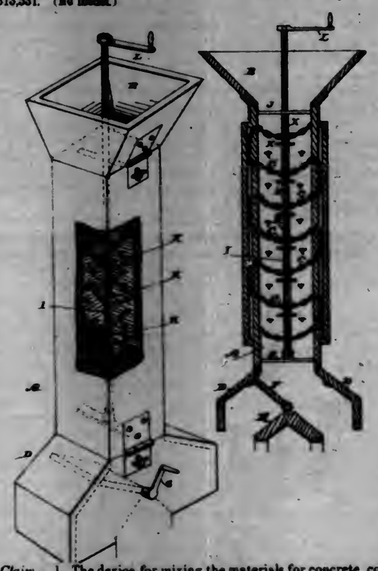
Claim.—In a washing-machine, the combination, with the semicircular tub, of the semicircular rubber having gains 18 in the bottom edges of the side pieces, a sheet-metal lining extending over about one-half of the bottom of the rubber and formed with tongues 17, projected from the side edges to lie in the gains of the side pieces, and rubbing slats having their ends secured in the gains and over the extensions of the partial-metal lining, substantially as described.

413,818. DEVICE FOR SUSPENDING ELECTRIC CONDUCTORS FOR ELECTRIC RAILWAYS. THOMAS E. ADAMS, Cleveland, Ohio. Filed July 24, 1889. Serial No. 318,553. (No model.)



Claim.—1. The combination, with a hanger provided with laterally-projecting arms and a conductor, of a sheet-metal clip bent around the conductor and said arms and securing the conductor to the hanger, substantially as and for the purpose specified.

2. The combination, with a hanger provided with laterally-projecting arms and a conductor, of a sheet-metal clip having open slots formed in its sides, and projections or fingers folded around said arms, substantially as and for the purpose specified.

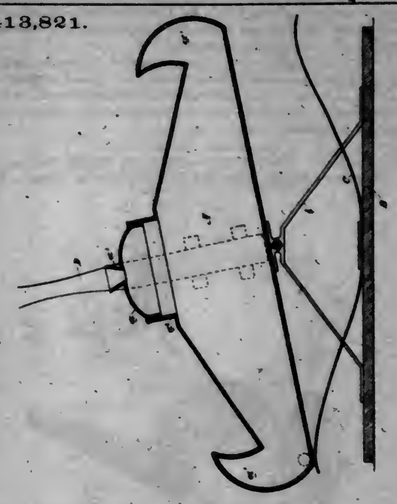


3. The combination, with a conductor and a hanger constructed with laterally-projecting arms, of a sheet-metal clip folded around the conductor and provided with arms bent around the laterally-projecting arms of the hanger, substantially as and for the purpose specified.

413,819. PULLEY. WARREN W. ARMABLE, Grand Rapids, Mich. Filed Sept. 5, 1883. Serial No. 294,675. (No model.)

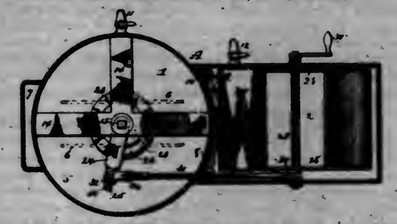
Claim.—A pulley having a rim made with a segment D, provided with lugs J' J', the spokes or arms, and a separable hub, one part of which is secured to said spokes or arms by a conical or tapering screw-bolt B, and the rim of said pulley having a balance-weight G opposite the removable segment, all substantially as shown and described.

413,820. CONCRETE-MIXING MACHINE. EVARISTE CHATAIN and SECONDO GILETTI, San Francisco, Cal. Filed June 7, 1889. Serial No. 313,531. (No model.)



Claim.—1. The device for mixing the materials for concrete, consisting of the vertical tube having the suspended chains fixed transversely within it, substantially as described.

2. A concrete mixing device consisting of the vertical tube, a series of loosely-suspended chains fixed transversely across it at intervals from top to bottom, the vertical shaft with transverse arms and an operating-crank, and the discharge-passages and controlling-gate at the bottom of the tube, substantially as described.



413,821. WASHING-MACHINE. HUGH CHURCHILL, Tulare, assignor of one-half to William L. Morrow, San Luis Obispo, Cal. Filed Mar. 25, 1889. Serial No. 304,721. (No model.)

Claim.—1. The rocking or oscillating containing-vessel A, having its interior space contracting to each end, and an air-chamber *a'*, opening out of and rising above said ends, and in which the air is compressed by the movement of the vessel's contents, substantially as described.

2. The combination of the rocking or oscillating containing-vessel A, having its top walls inclined downwardly from its center portions, and provided with a cap-controlled entrance-opening in its top center, upwardly and inwardly turned contracted ends, and air-chambers *a'* opening out of and rising above said ends, whereby air is compressed in said chambers by the action of the vessel's contents, the handle for rocking said vessel, and the assisting-spring beneath the bottom of the vessel, substantially as described.

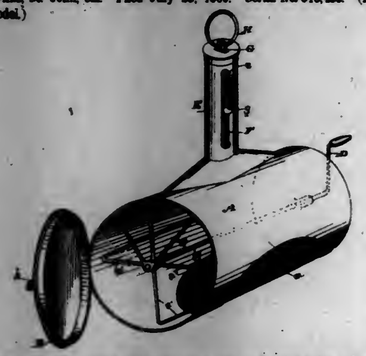
413,822. DISH-WASHER. WELLINGTON R. CHERRAN, West Line, Mo. Filed June 15, 1889. Serial No. 314,445. (No model.)

Claim.—1. In a dish-washing machine, the combination, with a case, a rotary crank-shaft, and buckets thereon, of a removable basket, a pitman extending from the crank-shaft, and a ratchet-and-pawl connection between the basket and pitman, whereby motion from the crank-shaft is communicated to the basket, substantially as set forth.

2. In a dish-washing machine, the combination, with a case, a rotary crank-shaft, and buckets thereon, of a shaft at right angles to the vertical crank-shaft, a basket mounted on the shaft, and a pitman extending from the crank-shaft and loosely connected with the other shaft, whereby motion is communicated to the basket, substantially as set forth.

3. In a dish-washing machine, the combination, with a case, a crank-shaft, and buckets thereon, of a shaft at right angles to the crank-shaft, a basket removably mounted on the shaft, a crown ratchet-toothed wheel on the shaft, an arm extending laterally from the shaft and having a gravity-pawl thereon adapted to engage the teeth of the wheel, and a pitman extending from the crank-shaft and having loose connection with the arm, whereby the latter is vibrated, substantially as set forth.

4. In a dish-washing machine, the combination, with a case, a rotary crank-shaft, and oppositely-extending buckets thereon, of a vertical shaft having an angular upper end, a removable basket, a crown-toothed ratchet-wheel secured on the shaft, and arm extending from the shaft, with a pawl thereon extending beneath a portion of the arm, a pitman extending from the crank-shaft, and a universal joint connecting the pitman with the arm, substantially as set forth.

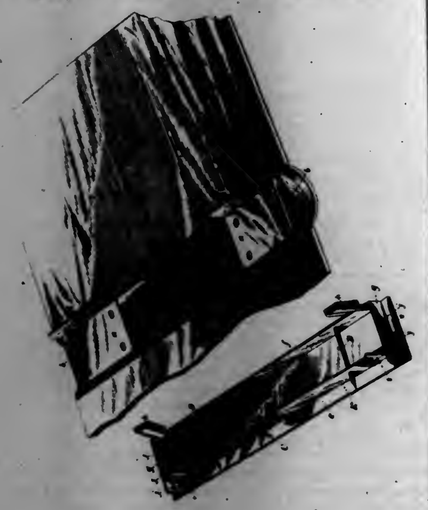


5. The combination, with a vessel divided into two communicating apartments and provided with a hollow bottom and a water-tank communicating with said hollow bottom, of a rotary shaft having buckets thereon, a vertical shaft actuated by the bucket-carrying shaft, and a basket carried by the vertical shaft, substantially as set forth.

6. The combination, with two compartments, each having a false bottom, said bottom being braced and having a frame thereon, of a vertical shaft having an angular upper end, a removable skeleton wire basket, a crown-toothed wheel on the shaft, an arm extending laterally from the shaft, with a gravity-pawl to engage the teeth on the

wheel, a rotary crank-shaft with the buckets thereon, a pitman extending from said shaft, and a universal joint connecting the pitman with the arm, substantially as set forth.

7. The combination, with a rotary basket, of a crank-shaft, a pair of buckets thereon with concaved bottoms, a pitman attached to the crank-shaft, and a pawl and ratchet connecting the pitman and basket support, whereby the latter is given periodical movement, substantially as set forth.



413,823. COMBINED FLOUR-SIEVE AND SCALES. ADELINE T. EVANS, St. John, Cal. Filed July 23, 1889. Serial No. 318,426. (No model.)

Claim.—1. The combined flour-sieve and scales consisting of the receptacle A, having the bottom screen, said receptacle being closed at one end and provided at the opposite end with a door, the rotating stirrers within the receptacle, the graduated hollow casing connected or formed with the top of the receptacle and having an elongated slot, the spring within the casing, the suspending-rod attached to the spring, and the indicating-finger connected with the rod and extending through the slot, substantially as described.

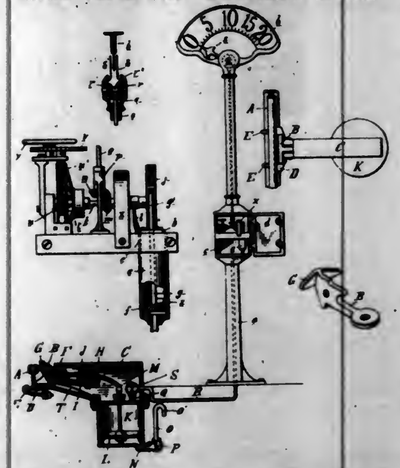
2. A combined flour-sieve and scales consisting of the receptacle A, closed at one end and having the bottom screen, the hinged cover at the opposite end of said receptacle, the central shaft in the receptacle projecting through the closed end thereof and having stirrer-arms, and the crank on the end of the shaft, the graduated hollow casing connected or formed with the top of the receptacle and having an elongated slot, the spring within the casing, the suspending-rod connected with the spring, and the indicating-finger carried by the rod and passing through the slot, substantially as described.

413,824. TEMPORARY BINDER. JAMES F. FITZPATRICK, Brooklyn, N. Y. Filed Sept. 23, 1888. Serial No. 286,659. (No model.)

Claim.—1. A temporary binder consisting of the combination, with an outer cover having transverse slideways on its back, of a separate filing-plate constructed to slide laterally into said ways, whereby it is united to said back.

2. A temporary binder consisting of the combination, with an outer cover having transverse slideways on its back and a stop at one side thereof, of a separate filing-plate constructed to slide laterally into said ways against said stop.

3. A temporary binder consisting of the combination, with an outer cover having transverse slideways at top and bottom of its back, of a separate filing-plate constructed at its ends to slide laterally into said ways.



4. A temporary binder consisting of the combination, with an outer cover having transverse slideways on its back, of a separate filing-plate constructed to slide laterally into said ways, and a fastening for preventing lateral displacement of said plate relatively to said back.

5. A temporary binder, consisting of the combination, with an outer cover having transverse slideways on its back and a stop at one side thereof, of a separate filing-plate constructed to slide laterally into said ways against said stop, and a fastening for preventing lateral displacement of said plate, consisting of a clip pivoted to said plate and constructed to turn down into engagement with said stop.

6. In a temporary binder, a filing-plate consisting of a flat back having a perpendicular side flange and perforated end flanges, filing-pins projecting from said side flange parallel with the back, a longitudinal follower-strip having perforations to admit said pins, and movable between said end flanges toward or from said side flange, and bolts at the ends of said strip adapted to enter the perforations in said end flanges, whereby the escape of the filed papers from the pins is prevented by said strip, which is adjustable to admit between itself and the side flange different thicknesses of papers.

7. In a temporary binder, an eye-piece for the papers to be bound, consisting of a strip to enter the fold in the paper, with an eye and two fingers projecting at the middle thereof and adapted to pass outside the fold, and said fingers adapted to be bent down against the exterior of the fold, whereby the paper is confined at its fold between the inside strip and the outside fingers.

413,825. RAILWAY TIME-SIGNAL. EUGENE FOSTAIN, Auburndale, Ohio. Filed Mar. 9, 1889. Serial No. 302,672. (No model.)

Claim.—1. In an automatic railway time-signal, a signal-actuating lever pivotally fulcrumed, and having a short arm extending into proximity to the rail and a resiliently-jointed long arm connected to the signaling devices, substantially as described.

2. In an automatic railway time-signal, the lever B, having a jointed long arm and actuated by the passing train on its short arm, and provided with the elastic cushion *j* in its long arm, substantially as described.

3. The combination, with the rail, of the signal-actuating lever B, provided with the cross-head G, arranged parallel to the rail, and with the resiliently-jointed arm consisting of the integral arm I, the arm H, fulcrumed thereon, and the elastic cushion J, secured between, substantially as described.

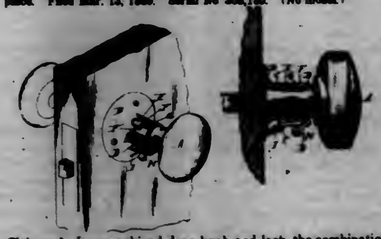
4. The combination, with the rail, of the signal-actuating lever B, the housing C, in which said lever is fulcrumed, and the clip E, securing the housing to the rail, substantially as described.

5. The combination, with the signal-actuating lever operated by a passing train and consisting of two parts resiliently jointed together, of an air-compressing device consisting of a cylinder and a piston operated by said lever, and of induction and eduction ports upon opposite ends of the cylinder, whereby the device operates as a dash-pot, substantially as described.

6. The combination, with the signal-actuating lever operated by the passing train, of the air-cylinder K, the piston L, actuated by said lever and operating non-air-tight in said piston, the induction-valve communicating with one end of said cylinder, and the eduction-valve S, communicating with the opposite end of the piston, substantially as described.

7. The combination of the signal-actuating lever B, provided with the cross-head G and the arm H, the housing C, inclosing said lever, and provided with the abutment D, the clamp-bolts E, securing said housing to the rail, the air-compressing cylinder K, secured to the housing, and the piston L, connected to the lever, substantially as described.

8. The combination, with the rail, of the lever B, provided with the cross-head G and the resiliently-jointed arm H, the housing C, in which said lever is fulcrumed, the abutment D of the housing fitted onto the rail, the clips E, securing the housing to the rail, the spring T, the air-cylinder K, secured to the housing, the piston L, the link M, connecting the piston-rod and the arm H of the lever, the induction-port N, the induction-valve P, the induction-pipe O, the eduction-port Q, the eduction-valve S, and the eduction-pipe R, all combined and arranged to operate substantially as described.

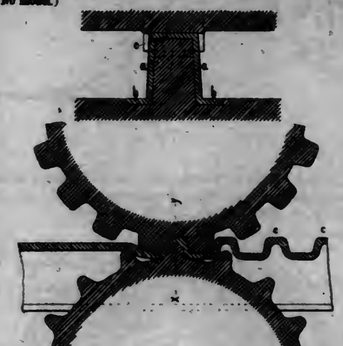


9. The combination, with the lever consisting of two parts resiliently jointed together and the air-compressing device actuated by the passing train, of the air-receiving cylinder, the riding and falling piston in said cylinder, the gear mechanism connecting it with the index-hand, the vent and automatically-operating valve for the escape of the compressed air from the cylinder after the piston is forced up, and the air-relief for the receding piston, substantially as described.

10. The combination of the air-receiving cylinder *e*, the piston *f*, actuated by the passing train, the piston-rod *g*, provided with a rack-bar, the clock mechanism provided with the actuating-spring and adapted to wind on its arbor, the gear-wheel *j*, engaging with the rack-bar, the gear mechanism connecting the index with the arbor of the clock mechanism, and the clutch *t* on the arbor, substantially as described.

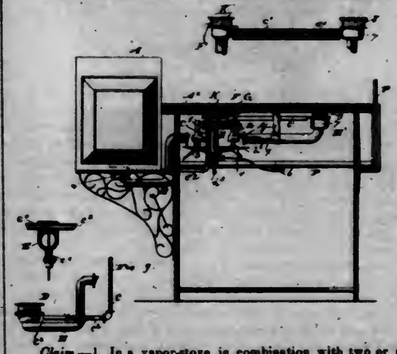
11. The combination of the index-hands *s* on opposite sides of the signal-dial, the shaft r^2, the bevel-pinions $r r'$, journaled upon said shaft and carrying the index-hands, the intermeshing bevel-pinion *q*, the vertical shaft *o*, carrying the said pinion, the bevel-pinion *n* on the lower end of said shaft, the clock mechanism, the arbor *k* of the clock mechanism, and the bevel-pinion *m* on said arbor, engaging with the bevel-pinion *n*, substantially as described.

12. The combination, with the actuating-lever operated by a passing train and its air-compressing device actuated by said lever, of the hollow post *a*, provided with the box *c*, the time-signal mounted on top of said post, the air-receiving cylinder *e*, provided with the piston *f*, the pipe R, connecting the air-receiving cylinder with the air-compressing device, the clock mechanism mounted in the box *c*, the gear mechanism connecting the arbor *k* of said clock mechanism with the piston of the air-receiving cylinder, and the signal-staff and gear mechanism connecting said arbor with the index-hands, substantially as described.



413,826. LOCKING DEVICE FOR DOOR-KNOBS. EPHRAIM HARBURN, Detroit, Mich., assignor of one-half to Robert Stewart, Jr., same place. Filed Mar. 13, 1889. Serial No. 303,195. (No model.)

Claim.—1. In a combined door knob and lock, the combination, with the shank of the knob, of the sliding sleeve D, provided with the tongue E, the longitudinal slot F, provided with the offset F', the pin or screw G on the shank of the knob engaging into said slot, and the notch C, formed on the cup of the rose, substantially as described.



2. In a combined door knob and lock, the combination of the sleeve slidingly secured on the shank of the knob and provided with a projecting tongue, and a notch formed on the rose, into which said tongue is adapted to engage, and a latch or dog and a keeper independent of said tongue and respectively attached to the sliding sleeve and the rose, substantially as described.

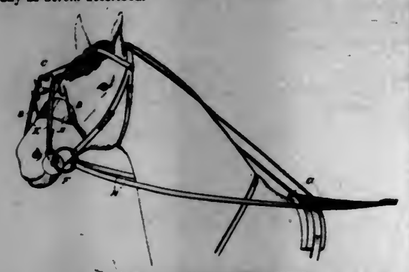
413,827. RACK-RAIL FOR MOUNTAIN RAILWAYS. HERMANN R. LEUPOLD, Berne, Switzerland. Filed May 8, 1889. Serial No. 310,048. (No model.)

Claim.—A rack-rail consisting in a bar of wrought-iron or steel having hollow projections formed thereon, which are closed at the sides and the top, and which constitute gear-teeth, substantially as described.

413,828. VAPOR BURNER AND STOVE. JAMES A. MANN, Cleveland, Ohio. Filed Jan. 28, 1887. Serial No. 225,822. (No model.)

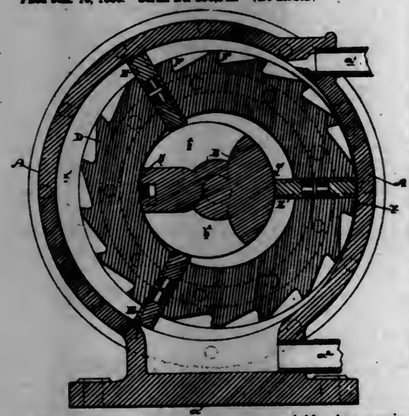
Claim.—1. In a vapor-stove, in combination with two or more burners, one of said burners being provided with a commingling-chamber, a pipe for carrying ignited gas from one burner to the other, and a pipe c^4, leading from said commingling-chamber into said gas-pipe for carrying into the latter unignited gas, as and for the purpose described.

2. In a vapor-stove, in combination with two burners, an induction or vapor tube for carrying the vapor from one burner to the other, a tube for carrying ignited gas from one of said burners to the other, a duct leading from said vapor-tube into said lighting-tube, and a valve controlling said duct, whereby gas may be thrown to both burners, substantially as described.



413,829. OVERDRAW BRIDLE ATTACHMENT. PENTALBA L. MANN, Hollister, Cal. Filed May 9, 1889. Serial No. 310,162. (No model.)

Claim.—1. A bridle having a standard adapted to be supported upon the face of the horse so as to project outwardly therefrom, said standard having guides for the check-rein, substantially as described.



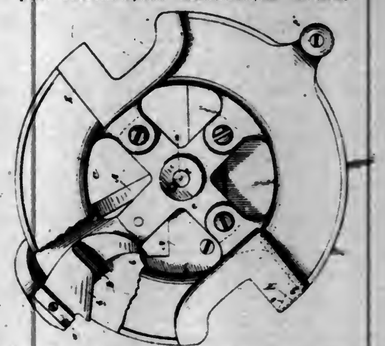
2. A bridle having standards provided with rein-guides D and the curved padded face-plate adapted to fit upon the face of the horse below the eyes, substantially as described.

3. A bridle having the padded face-plate and standards projecting therefrom, guides upon said standards, through which the check-rein may pass between the attachment at the bit and the top of the

horse's head, said checkrein having its opposite ends attached to the driving-reins, so as to be operated in connection therewith, substantially as herein described.

413,830. ROTARY STEAM-PUMP. ENOCH I. NICHOLS, San Francisco, Cal., assignor to the Nichols Manufacturing Company, same place. Filed Jan. 16, 1889. Serial No. 296,542. (No model.)

Claim.—1. In a rotary steam-pump, a revolvable piston-carrier forming a separate steam and water abutment and a separate steam and water space and having a single set of pistons, each of which alternately traverses and withdraws from said steam and water spaces, and a fixed center bolted to the main frame and having the inlet and outlet ports in its ends, substantially as described.



2. In a rotary steam-pump, the combination of the outer shell having a steam-inlet and a steam-exhaust port, an inner fixed center bolted to said shell and having a water-inlet port and a water-outlet port formed in its ends, a rotary annular piston-carrier between the outer shell and the fixed center, forming with each a contact-abutment and a steam and water space, respectively, and pistons mounted in said carrier and adapted to be projected into and withdrawn from said steam and water spaces, substantially as described.

3. In a rotary steam-pump, the combination of the outer shell having a steam-inlet and a steam-exhaust port, an inner fixed center having a water-inlet port and a water-outlet port formed in its ends and communicating with pipes at the ends of said center, a rotary annular piston-carrier between the outer shell and the fixed center, forming with each a contact-abutment and a steam and water space, respectively, and sliding pistons mounted on the piston-carrier, their ends bearing against the shell and the fixed center, whereby they are withdrawn from and projected into the steam and water spaces, substantially as described.

4. A rotary steam-pump comprising an outer shell having a steam-inlet and a steam-exhaust port, an inner center fixed to the shell and having a port with inlet and outlet connections through its ends and the ends of the outer shell, a rotary annular piston-carrier between the outer shell and the fixed center and mounted upon the ends of said center, said carrier having peripheral pockets and being so arranged as to form a contact-abutment with the outer shell and contact-abutment with the fixed center and steam and water spaces, as described, and sliding pistons mounted in the carrier and extending between the periphery of the fixed center and the inner circumference of the outer shell, whereby they are adapted to be projected into and withdrawn from the steam and water spaces, substantially as described.

5. In a rotary steam-pump, the combination of the outer shell with inlet and outlet steam-ports, the ported center fixed to the outer shell and having water inlet and outlet ports, the rotary piston-carrier located between the fixed center and the outer shell and forming opposite contact-abutments with each and opposite spaces for steam and water, said carrier having pockets upon its periphery, into which the steam is projected from the inlet-port, and sliding pistons mounted in the carrier and bearing between the fixed center and the outer shell, whereby they are projected into and withdrawn from the steam and water spaces, substantially as described.

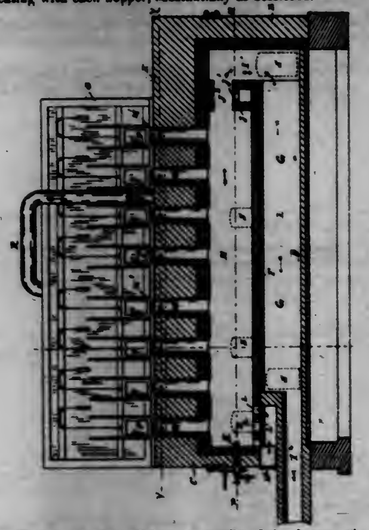
413,831. FRUIT-PITTING MACHINE. ENOCH I. NICHOLS, San Francisco, Cal., assignor to the Nichols Manufacturing Company, same place. Filed Jan. 16, 1889. Serial No. 296,544. (No model.)

Claim.—1. In a fruit-pitting machine, a rotary wheel having a grooved periphery with perforated-bottomed sockets formed therein for the fruit, in combination with a fixed punch lying within the grooved periphery of said wheel, with its axis in the line of travel thereof, substantially as described.

2. In a fruit-pitting machine, a rotary wheel having a grooved periphery with perforated and slitted bottomed sockets formed therein for the fruit, in combination with a fixed punch lying within the grooved periphery of said wheel, with its axis in the line of travel thereof, and cutting-wings secured to each side of the punch and lying within the grooved periphery of the wheel and in the radial plane thereof, substantially as described.

3. In a fruit-pitting machine, a fixed bracket having at its base a journal-pin and a rotary wheel mounted on said pin and having a grooved periphery with open-bottomed sockets formed therein, in combination with a punch fixed to the top of the bracket and lying within the grooved periphery of the rotary wheel, with its axis in the line of travel thereof, and cutting-wings secured to each side of the punch and lying within the grooved periphery of the wheel and in the radial plane thereof, substantially as described.

4. In a fruit-pitting machine, a winged punch, in combination with a carrier having sockets with perforated and slitted bottoms for the passage of the winged punch, separated metal plates fitted in said sockets as seats for the fruit, and perforated slitted cushion-pieces under said plates, with their edges projecting into the space between the separated bases thereof, substantially as described



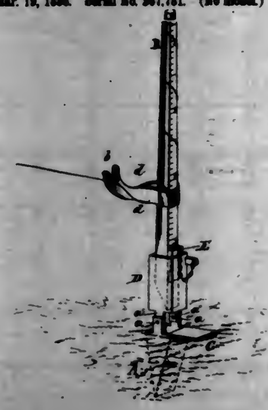
413,832. GARBAGE-CREMATING FURNACE. ALEXANDER L. PATRICK, Detroit, Mich. Filed Apr. 15, 1889. Serial No. 307,264. (No model.)

Claim.—1. In a cremating-furnace, the combination of the furnace-chamber, the fuel-burning device at the front end of said chamber, the hollow bridge-wall at the rear end thereof, having air-feeding devices, the return-flues below the furnace-chamber, the hoppers communicating with said chamber, and the vents communicating with the hoppers, substantially as described.

2. In a cremating-furnace, the combination of the furnace-chamber and return-flue, the air-flue at the front end of the furnace-chamber, the fuel-burning device at the said front end, the hollow bridge-wall at the rear end of said furnace-chamber having air-feeding openings, the hoppers above said furnace-chamber, the flue connecting said hoppers, the garbage-receptacle, and the ventilating-pipe leading from said receptacle to the said flue, which connects the hoppers, substantially as described.

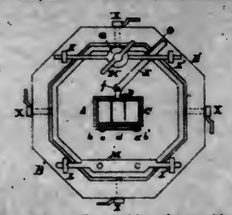
3. In a cremating-furnace, the combination, with the furnace-chamber, of the feed-hoppers and the flue connecting said hoppers, substantially as described.

4. The combination, with the outer walls of the furnace and the furnace-chamber formed therein, of the rows of hoppers formed through the top of the furnace and the vent-flue closed at its ends and communicating with each hopper, substantially as described.



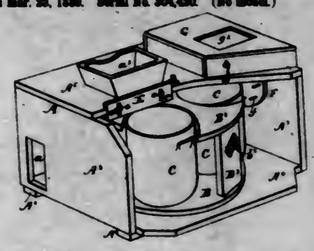
5. The combination of the outer walls of the furnace, the division-walls F and G, dividing the furnace into a furnace-chamber H and return-flues I, the downflue I', connecting the furnace-chamber and return-flues, the burners K in the front wall of the furnace, the perforations L in the division-wall F, the air-flue L', communicating therewith, the bridge-wall J, with its air-feeding devices, the openings M in the top of the furnace-chamber, and the closed vent-flue N, communicating with the openings M, all substantially as described.

6. The combination, with the furnace and furnace-chamber extending on top and provided with openings through the top of the furnace, and the hoppers communicating with said openings for filling in the garbage, substantially as described, of the garbage-receptacle elevated above the top of the furnace and along one side thereof, the sliding doors P in proximity to the tops of the hoppers, the closed vent-flue communicating with the said hoppers, and the ventilating-pipe R, leading from the receptacle into the ventilating-pipe connecting said hoppers, substantially as described.



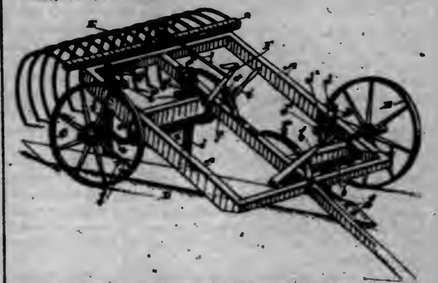
7. In a cremating-furnace, the combination of the furnace-chamber, the hollow bridge-wall, the air-supply, the hoppers, the flue connecting said hoppers, the garbage-receptacle, and the ventilating-pipe leading from the receptacle to said flue, substantially as and for the purpose described.

413,833. WIRE-STRETCHER. ROBERT G. PIKE, Jr., Brooklyn, N. Y. Filed Mar. 19, 1888. Serial No. 267,781. (No model.)



Claim.—A wire-stretcher consisting of the wedge A, provided with flange C, and the socket D, hinged to said wedge, in combination with the lever B, fitted to socket D, substantially as shown.

413,834. DETACHABLE HEAD FOR BRICK OR TILE MACHINES. EDMUND ROTHWELL, NAPOLEON L. DARBY, and ALBERT ANDREWS, Little Falls, Minn. Filed Nov. 3, 1888. Serial No. 290,056. (No model.)

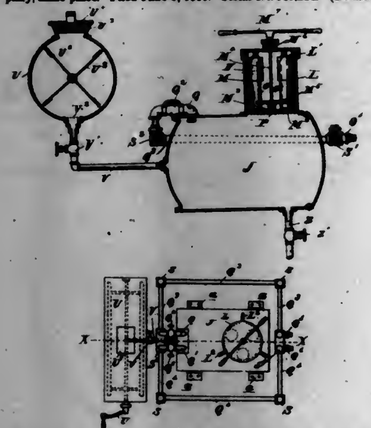


Claim.—In a brick or tile machine, the combination of a body B, plate B', set-screws X, and eyebolts L and L' K and K', combined with the hinge-bar M, plate A, press-bar G, screw I, and handle H, all substantially as and for the purpose set forth and described.

413,835. GRAIN-TALLY. FRANCIS M. ROWE, Middlebury, Ind. Filed Mar. 23, 1889. Serial No. 304,430. (No model.)

Claim.—A grain-register consisting of a frame having a hopper in the top and perforations in the bottom and side thereof, a revolving measure-carrier having open sides, a perforated bottom disk, removable measures therein, and segmental arms level with the top of said measure, standards uniting said disk and arms, laterally-extended beveled projections upon said standard, and registering gearing operated by said projections, substantially as described.

413,836. CULTIVATOR. ISAAC SYLVESTER, Colusa, Cal., assignor of one-half to R. A. Gray, same place. Filed June 26, 1889. Serial No. 315,057. (No model.)



Claim.—1. In a cultivator, the frame and the independent axles carrying wheels, one of said wheels being near the front at one side and the other near the rear at the other side, in combination with the diagonally-arranged cutting-blade extending from one of the front corners to one of the rear corners of the machine and standards extending from said blade and adjustably secured to the frame, substantially as described.

2. In a cultivator, the frame, the independent wheels carrying it, one arranged near the front at one side and the other near the rear at the other side, the independent crank-axles on which said wheels are mounted, and the levers for operating them, in combination with the diagonally-arranged cutting-blade carried by the frame and extending from one of its front corners to one of its rear corners, substantially as described.

3. In a cultivator, the frame, the independent wheels, and the independent axles upon which said wheels are mounted, in combination with a diagonally-arranged cutting-blade carried by the frame and extending from one of its front corners to one of its rear corners, a rake attachment at the rear of the frame, and a lever for operating the same, substantially as described.

4. A cultivator consisting of the frame, the wheels carrying it, and the independent crank-axles and the levers for operating them, the diagonally-arranged cutting-blade, the adjustable standards connected with the blade and frame, and the swinging rake attachment at the rear of the frame, substantially as herein described.

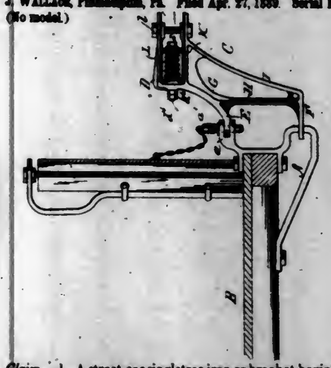
413,837. **CHEMICAL-ENGINE.** RANDALL T. VAN VALKENBURG, Muskegon, Mich., assignor to the Muskegon Chemical Fire Engine Company, same place. Filed June 5, 1889. Serial No. 313,221. (No model.)

Claim.—1. In a chemical-engine, the combination, with the generator, of a quadrilateral system of discharge-pipes divided by central partitions and two independent discharge-pipes connecting each half thereof with the generator, substantially as described.

2. In a chemical-engine, the combination, with the generator, of a quadrilateral system of discharge-pipes divided by central partitions, perforated caps contained in enlarged couplings or sections of said system, and two independent discharge-pipes connecting said system with the generator, substantially as described.

3. The combination, with the generator, of a quadrilateral system of discharge-pipes provided with the couplings S, S', and S^2, the dividing-partitions *c* in the couplings S' S^2, the hose-connections Q^3 and Q^4 on the coupling S', and the two independent discharge-connections Q and Q' from the generator to the coupling S^2, substantially as described.

4. The combination, with the generator, of the quadrilateral system of discharge-pipes Q^3 and Q^4, the couplings S' and S^2 in said system, the dividing-partitions *c* in said couplings, the hose-connections Q^3 and Q^4 on the coupling S', the corner-couplings S, and the perforated caps T, removably secured in the couplings S and S', substantially as described.



5. In a chemical-engine, the combination of the generator, the dome L, provided with the removable head L', the acid-containing vessel M, detachably fitting therein and provided with the ribs M', engaging into grooves in the cylindrical wall of the dome, the acid-holding pocket secured to the walls of the vessel M, the breaker-shaft M^4, provided with the breaker-arms M^3, and the lever M^7, substantially as described.

6. In a chemical-engine, the combination of the frame, a generator supported therein, the quadrilateral system of discharge-pipes, the couplings and hose-connections for said pipes, the dome on the generator, the perforated bottom, the breaker and the pockets in said dome, the stirring-tub communicating with the generator, and the stirrer in said tub, the parts being adapted to serve substantially as and for the purpose described.

7. In a chemical-engine, the combination of the frame, the generator supported therein, the quadrilateral system of pipes having the couplings and hose-connections, the stirring-tub having the stirrer, the pipe leading from the said tub to the generator and having a valve, the dome on the generator, the detachable acid-containing vessel in said tub having the pockets and perforated bottom, the breaker in said vessel, and the catch for retaining the breaker, all arranged and adapted to operate substantially as and for the purpose described.

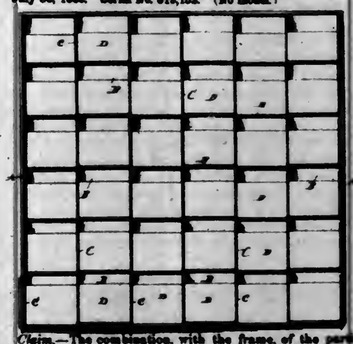
8. In a chemical-engine, the combination of the frame, the generator supported therein, the quadrilateral system of discharge-pipes divided by central partitions, two independent discharge-pipes connecting each half thereof with the generator, the couplings for the said pipes, and the hose-connections, all substantially as described.

413,838. **STREET-CAR COUPLING.** GEORGE R. ALLEN and EDWARD J. WALLACE, Philadelphia, Pa. Filed Apr. 27, 1889. Serial No. 308,890. (No model.)

Claim.—1. A street-car singletree iron or bracket having an outer open end, a sliding casing in said open end, draft-springs in said casing, and a singletree coupling-pin mounted in said open end and sliding casing, substantially as set forth.

2. A street-car singletree iron or bracket C, having an open-end yoke D, a sliding open-end casing K, bolt d^3, and spring L, substantially as set forth.

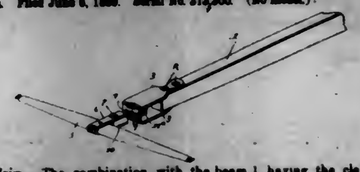
3. A street-car singletree iron or bracket C, having open-end yoke D, provided with elongated slots, a sliding open-end casing K, having pin-openings registering with said slots, a bolt d^3, and spring L, substantially as set forth.



4. A street-car singletree iron or bracket having a fixed yoke with open end provided with elongated slots, a sliding open-end casing having pin-openings registering with said slots, a bolt passing through the rear ends of said yoke, and a spring or springs between the head of the bolt and the rear end of said sliding casing, substantially as set forth.

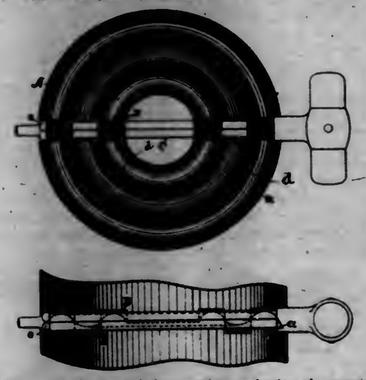
5. A street-car singletree iron or bracket having an open end, sliding casing, a draft-spring therefor, and guides or ways for said yoke, substantially as set forth.

6. A street-car singletree iron having limbs E and F, yoke D, provided with slots d^3, and ways or guides d^4, sliding casing K, and bolt d^3, with adjusting mechanism and spring or springs L, substantially as set forth.



7. A street-car singletree iron or bracket having an outer open end, guides or ways on said end, a sliding casing in said open end between its guides or ways, draft-springs of different capacities in said sliding casing, and a singletree coupling-pin mounted in said open end and sliding casing, substantially as set forth.

413,839. **HOG-CAGE.** JOHN W. ALBACK, Connecton, Ohio. Filed July 30, 1888. Serial No. 319,152. (No model.)



Claim.—The combination, with the frame, of the partitions secured at their ends to the frame and separate strips bent to form cells placed between the partitions and secured at their ends only, the cells being free to adapt themselves to large or small commodities, substantially as described.

413,840. **COUPLING FOR CLEVISES.** CORNELIUS AVERITT, Blakely, Ga. Filed June 6, 1889. Serial No. 313,300. (No model.)

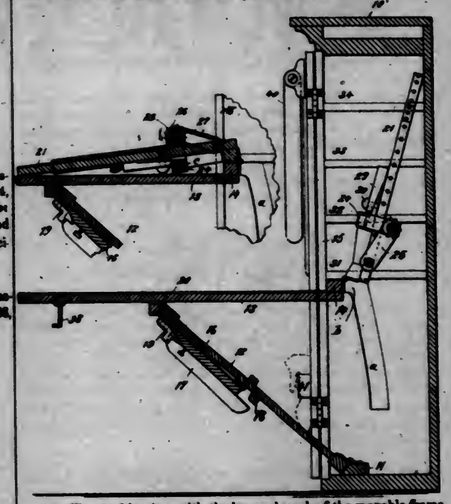
Claim.—The combination, with the beam 1, having the clevis-strap 3 bolted to the sides thereof, and the horizontal key-hole slot 4, in combination with the singletree 5, the block 10, and the clip 6, for connecting the block and tree, and the key 8, having the shank 9, and vertical fins 11, adapted to fit within the slot 4, substantially as specified.

413,841. **PIPE-DAMPER.** HENRY W. AVERY, Cleveland, Ohio, assignor to the Avery Stamping Company, same place. Filed Jan. 31, 1889. Serial No. 297,864. (No model.)

Claim.—1. A sheet-metal damper-plate E, having the annular corrugations *d d* and the alternately-bent straps B B', the upper straps being bent from the upwardly-bent corrugations and the lower straps from the downwardly-bent corrugations, substantially as and for the purpose specified.

2. A sheet-metal damper-plate A, having the annular corrugations *d d*, the alternately-bent straps B B', and the downwardly-bent annular flange *a*, combined with a damper-rod C, having a shoulder *c*, substantially as and for the purpose specified.

3. A sheet-metal damper-plate having a substantially-horizontal rim with annular corrugations, a conical central part with an opening therethrough, and the alternately-bent straps B B', substantially as and for the purpose specified.



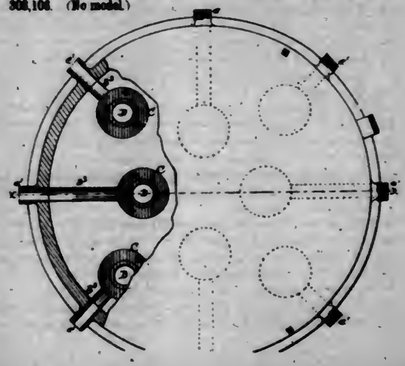
4. A sheet-metal damper-plate having the alternately-bent straps integral therewith, combined with the damper-rod C, having the shoulder *c* upon the upper side of said rod, whereby the weight of the damper causes it to engage with said shoulder *c*, substantially as and for the purpose specified.

413,842. **KITCHEN-CABINET.** JOHN H. BALL, Kansas City, Kans. Filed Apr. 2, 1889. Serial No. 305,708. (No model.)

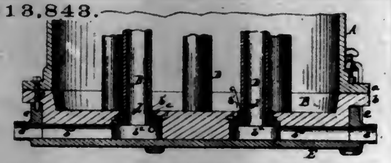
Claim.—1. The combination, with a kitchen-cabinet having an open front provided with a door and guideways in the lower portions of its sides extending upwardly and outwardly to the door-opening, of an ironing-board of a length to pass through the door-opening into the cabinet, and provided at its inner end with projections entering said ways, whereby the board may be raised from its operative position, pushed inwardly, and lowered to completely inclose it within the cabinet, substantially as set forth.

2. The combination, with a cabinet formed with slots *a* and *b*, of a brace 12, hinged to the flooring of the cabinet, and an ironing-board hinged to the brace and provided with a cross-bar which rides in the slots *a* and *b*, substantially as described.

3. The combination, with an ironing-board, of a bosom-board hinged thereto, a frame arranged in connection with the bosom-board, a roller supported by the frame, a ratchet-wheel carried by the roller, a pawl arranged to engage the ratchet, and a frame-locking cam pivoted to the under side of the bosom-board and adapted to engage the lower cross-piece of the frame and press the roller against the upper side of said bosom-board, substantially as described.



4. The combination, with the bosom-board, of the movable frame 24, embracing it, the roller 23, journaled in the side bars of the frame and extending across the upper side of the board, links pivoted to the board and to the frame, a cam for operating the frame to bring the roller against the board, and means for adjusting the roller, substantially as set forth.

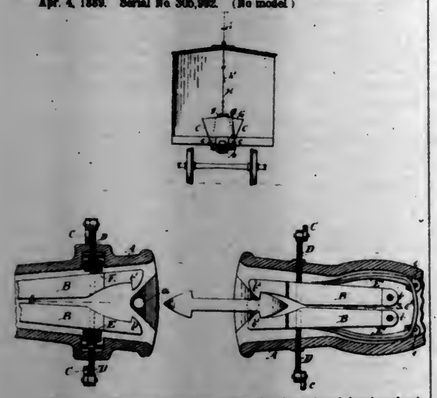


5. A kitchen-cabinet having an open front, upwardly and outwardly extending slots or ways *a b* in its sides, the lower ends of the slots being about midway between the vertical edges of the sides, the ironing-board having a cross-piece 14 entering said slots or ways, a bosom-board hinged at its rear end to the rear end of the ironing-board on the upper side thereof, a brace 12, hinged at its upper end to the lower side of the ironing-board between the ends thereof and at its lower edge hinged to the cabinet-bottom in front of the lower ends of the slots or ways, the bench 16, hinged to the outer side of the brace between its ends, whereby the bosom-board will occupy the space behind the ironing-board and the bench the space in front thereof when the said parts are swung into the cabinet, substantially as set forth.

6. The combination, with a cabinet, of a brace hinged therein, a wash-bench hinged to the brace, a catch arranged in connection with the wash-bench, an ironing-board hinged to the brace, and a transverse strip carried by the ironing-board and arranged to ride in grooves or recesses formed in the cabinet, substantially as described.

413,843. **APPARATUS FOR MAKING PRINTERS' ROLLERS.** LEANDER K. BUSHMAN, New York, N. Y. Filed Mar. 13, 1889. Serial No. 303,106. (No model.)

413,843.

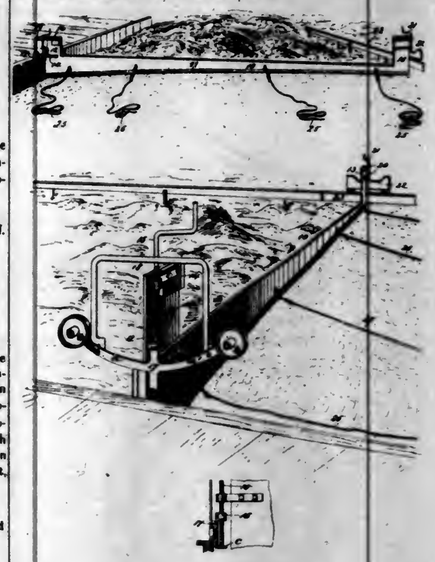


Claim.—The combination of the cylinder, its mold-tubes, the lower head having the holes for the mold-tubes, and the channels running from the holes to the edge of the head, with the bottom provided with the nozzles, as set forth.

413,844. **MARKING-PUNCH.** VINCENT BIRNIE, Greenville, N. J. Filed Jan. 3, 1889. Serial No. 295,275. (No model.)

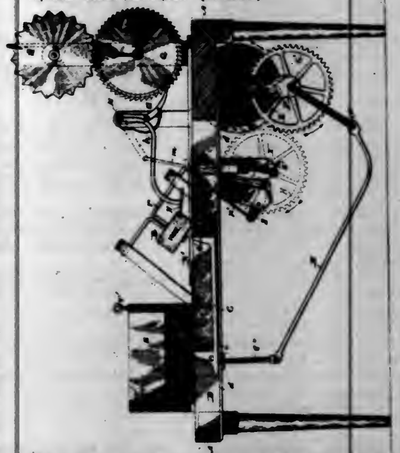
Claim.—In a changeable marking-punch, the combination of the solid bar-like stock A, having a slot *c* in its forward end, the peripherally-notched projecting marking-wheel B, arranged to rotate within said slot and having a series of symbolically-marked stamping projections *g*, also corresponding symbols on its face opposite said projections, and the side lever-catch C, arranged to engage directly with the notches in the peripheral surface of the marking-wheel, between the projections *g*, and a spring operating to maintain said engagement, substantially as shown and described.

413,845. **CAR-COUPLING.** WILLIAM M. BUSCH, Sheldon, Mo. Filed Apr. 4, 1889. Serial No. 305,992. (No model.)



Claim.—1. The combination, with the draw-head having horizontal spring-pressed coupling-jaws provided with upwardly-projecting operating-levers C C, pulleys *g g* on the end of the car, and the chain G, connecting the upper ends of the levers and passing upward between the pulleys, of the vertically-sliding rod H, connected at its lower end to the chain above the pulleys and provided with a laterally-projecting catch h, adapted to engage a projection on the car and hold the rod in its raised position, substantially as set forth.

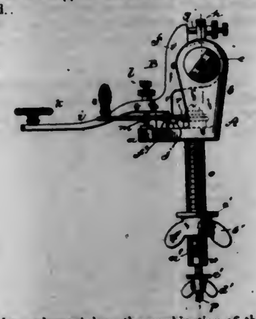
2. The combination, with the draw-head having longitudinally-extending hooked jaws B, pivoted at their inner ends within the inner end of the head, and operating-levers, of two plate-springs E E, secured at *e e* and bearing against the sides of the jaw, and a U-shaped spring *e'*, embracing the springs E E, substantially as set forth.



413,846. **ROAD-GRADER.** HENRY J. CHAMBERS, Beatrice, Nebr., assignor to William H. Duffett, same place. Filed July 31, 1889. Serial No. 319,262. (No model.)

Claim.—1. The combination, with a board 10, of trucks secured to the ends thereof, and central rails 23, one of the trucks being arranged to ride upon said rails and the other truck being arranged to ride upon the curb, substantially as described.

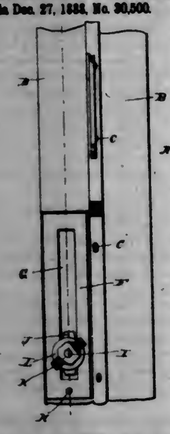
2. The combination, with a board 10, having a shoe 11, and provided with draft-ropes 25, of trucks, center guide-rails, upon which one of the trucks is arranged to run, the other truck being arranged to ride upon the curb, and an adjustable connection, substantially as described, between the board and the trucks.



413,847. **COMBINED LETTER-STAMP CANCELER, DATER, AND NUMERICAL REGISTER.** HUGH C. CRANE, Forest, Miss. Filed July 11, 1888. Serial No. 279,647. (No model.)

Claim.—The combination of the stamp N, provided with the table A A, having the letter-box B, the guides *k* and *k'*, the stop P and its connecting-pitman, the carriage C, having the fingers *c* and *c'*, the way *d d*, the projecting arms *e'*, the pitman E, the crank *f* of the shaft F, the cog-wheels G and G', the shaft I and the cog-wheel H, the shaft K and the spur-wheel *g* and the fly-wheel L, the cam S' and lever S, the rod or axle M and its supports *a* and *a'*, with its arm *h* and the pitman *m*, the ink-pad R, the rod *r* and its supports, the connecting rod or pitman *r'*, the pawl O and its spring, the regulating-screws T and T', and the registering device Q and Q', as and for the purposes substantially as described.

413,848. **TELEGRAPH-KEY.** EUGENE S. CHILL, Mount Carmel, Ill. Filed Mar. 21, 1889. Serial No. 304,106. (No model.)



Claim.—1. In a telegraph-key, the combination, with the key-lever B, provided with the annular internally-grooved end *c*, of the screws C, provided with grooved inner ends, the balls *d*, placed between the ends of the screws C and the annular ends *c* of the key-lever, and the supports and electrical connections, substantially as specified.

2. In a telegraph-key, the combination of the head A, provided with the apertured and internally-threaded base-plate *a*, the tubular leg *v*, the inner leg *p*, the insulation separating the two legs, the contact-disk *r*, and the circuit-closing lever *s*, placed upon the inner leg *p*, the key-lever B, provided with the contact-arm *f'* and the internally-grooved annular end *c*, the grooved screws C, and the balls *d*, substantially as specified.

3. In a telegraph-key, the combination of the head A, provided with the apertured and internally-threaded base-plate *a*, the tubular leg *v*, the inner leg *p*, the insulation separating the two legs, the contact-disk *r* and the circuit-closing lever *s*, placed upon the inner leg *p*, the key-lever B, provided with the contact-arm *f'* and the internally-grooved annular end *c*, the grooved screws C, the balls *d*, the limit-screw *g*, and the retractile spring *m*, substantially as specified.

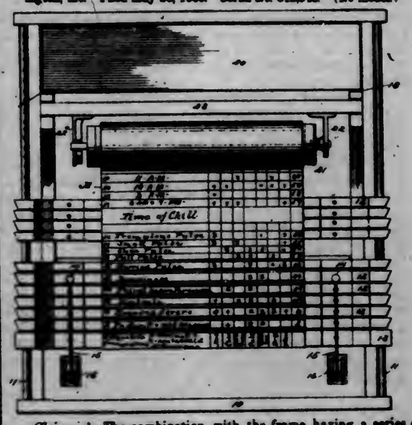
413,849. **SASH-FASTENER.** WILLIAM DENGOLL, Brockville, Ontario, Canada. Filed Jan. 30, 1889. Serial No. 298,092. (No model.) Patented in Canada Dec. 27, 1888, No. 30,500.

Claim.—1. A sash-supporter comprising a plate secured to the window-frame below the sash and adapted to bear against the lower edge of the sash and adjustable vertically along the window-frame, as set forth.

2. A sash-supporter comprising a longitudinally-slotted plate arranged adjacent to the window-frame below the sash, the screw passing through the slot in the plate and secured in the window-frame, and the thumb-nut mounted on the screw and bearing against the outer side of the plate, as set forth.

3. A sash-supporter comprising the longitudinally-slotted plate arranged below the sash and adjacent to the window-frame, the screw passing through the slot in the plate and into the window-frame and having lateral wings fitting in the slot in the plate, and the thumb-nut mounted on the screw and bearing against the outer side of the plate, as set forth.

413,850. **STOVE-PIPE HANGER.** CHARLES W. BUNDY, Emerald Grove, Wis. Filed June 6, 1889. Serial No. 313,353. (No model.)



Claim.—1. In a device for the purpose described, the combination, with the disk and the parallel wires secured thereto and having a block secured at their lower ends, of the wire D, passed loosely through a vertical opening in said block and made adjustable therein, substantially as and for the purpose described.

2. The combination, with the disk, the parallel wires, and the block secured to the lower ends of the wires, of the wire D, vertically adjustable within said block, said wire D being provided at its upper end with loops loosely embracing the parallel wires, and at its lower end with hooks D^3 and D^4, substantially as and for the purpose described.

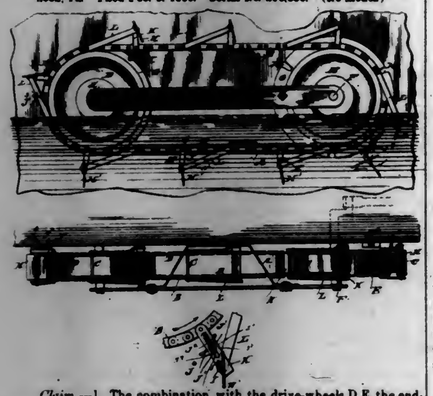
3. The pipe-hanging device herein described, the same comprising, in combination, a disk provided upon its upper face with a screw, the parallel wires secured at one end to the lower face of the disk and having a block secured to their opposite ends, the wire D, vertically adjustable within said block and provided at its lower end with hooks, the wire E, bent to form the loop E^2 and the horizontal arms E^3, and the sheet-metal band F, provided at its ends with loops F', to engage the arms E^3, substantially as described.

413,851. **MECHANICAL REPERTORY.** JOSEPH J. FOWLER, Washington, No. Filed May 26, 1889. Serial No. 312,344. (No model.)

Claim.—1. The combination, with the frame having a series of adjustable parallel transverse strips, of a roller having an indicating or symptom-carrying fabric adapted to extend over and between said strips, substantially as set forth.

2. The combination, with the frame having a series of parallel transverse strips adjustable in the same plane, of the indicating or symptom-carrying fabric and the block 30 to rest thereon for inserting the fabric between the strips, substantially as set forth.

3. The combination, with the frame having a series of parallel transverse strips adjustable in the same plane and having apertures, of the springs having cords provided with pegs to enter said aper-



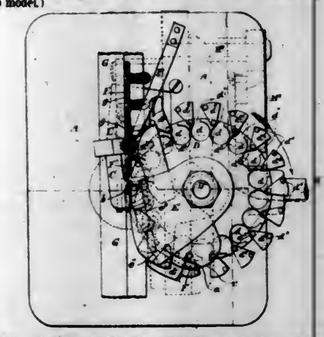
tures and draw the strips toward one end of the frame, substantially as set forth.

4. The combination, with the frame having parallel rods 11, of the strips 12, having apertures *a*, through which the rods pass, and apertures *b*, the pulleys *c*, the cords 15, passing over said pulleys and having pegs to enter apertures *b*, and the springs 17, connected to the opposite ends of the cords, substantially as set forth.

5. The combination, with the frame having ways 18, openings *f f*, and the removable roller-supporting frame 20 in said ways, of the fabric-carrying rollers transferable from said removable frame to the openings *b*, and the adjustable strips 12, substantially as set forth.

6. The combination, with the frame having a series of parallel adjustable strips in the same plane, of a roller provided with a strip ruled transversely to form spaces to register with the exposed faces of the strips, and similar numbers at the ends of each ruled space to show when the space is on its proper strip, substantially as set forth.

413,852. CHAIN PROPELLER. NELSON W. FRENCH, Tunkhannock, Pa. Filed Feb. 6, 1889. Serial No. 298,856. (No model.)



Claim.—1. The combination, with the drive-wheels D E, the endless chains traveling thereon, and fixed projections secured to the side of the boat and disposed one near the lower rear edge of the wheel E and the other near the upper front edge of the wheel D, of blades pivotally secured to the endless chains, as shown, and automatically-operated stops carried by the said chains and normally holding said blades in operative position, said stops adapted to engage the fixed projections on the boat and be thereby released from contact with the blades, substantially as and for the purpose hereinbefore described.

2. The combination, with the drive-wheels D and E, the endless chains mounted thereon, provided with arms K, normal to the chain, and projections J^3 J^4, fixedly secured to the sides of the boat and disposed one near the lower rear edge of the wheel E and the other near the upper front edge of the wheel D, of the blades H', provided near the upper portion of their ends with journals, said journals pivoted in the outer ends of the arms K, and automatic stops on one of each pair of arms K, adapted to engage the blades and hold them in position for operation and arranged to engage the fixed projections to release said blades, substantially as and for the purpose hereinbefore described.

3. The combination, with the drive-wheels D E, endless chains mounted thereon, provided with a series of pivoted frames J, consisting of projecting arms K and the brace-rods L, the blades H', pivoted above their central portion in the lower ends of the arms K, and the fixed projections J^3 J^4, secured to the sides of the boat and disposed one near the lower rear edge of the wheel E and the other near the upper front edge of the wheel D, of spring-actuated stops secured to one of each pair of said arms K, said stops provided with a head portion J^5, provided with a recess J^6, a long projecting portion J^7, a short projecting portion j^8, having a beveled edge, whereby said stop will be raised when the blades H' are operated in a backward direction, thereby causing the upper ends of said blades to engage said beveled portion, raise the stop, and slip into the recess, and a projection J^8, adapted to engage the fixed projections J^3 J^4, substantially as and for the purpose described.

4. The combination, with the drive-wheels D E, provided with a series of transverse recesses H in their peripheries and annular recesses G G at their peripheral edges, as shown, of the endless chains formed of flat links B, traveling in said annular recesses G, connected by cross-bars C C, adapted to engage the recesses H H in the wheels D E, pivoted frames secured to said chains the blades pivotally mounted in said frames, as shown, automatically-operated stops secured in said frames J, adapted to normally hold the blades H' in operative position while in motion in the water, and fixed projections J^3 J^4, secured to the sides of the boat and disposed one near the lower rear edge of the wheel E and the other near the upper front edge of the wheel D, said automatic stops adapted to engage said projections J^3 J^4 and be released from contact with the blades, substantially as and for the purpose shown and described.

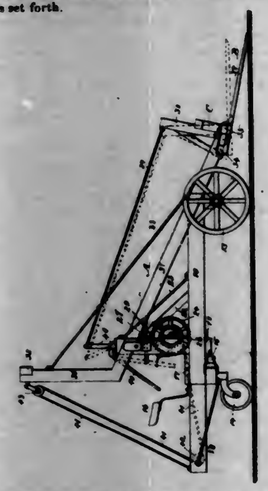
413,853. CORD-LOOPING ATTACHMENT FOR SEWING-MACHINES. MARSHALL GARDNER, Aurora, Ill., assignor, by direct and mesne assignments, to James Stone and Alice M. Ball, same place, and Elizabeth Florsheim, Chicago, Ill. Filed Dec. 1, 1887. Serial No. 256,595. (No model.)

Claim.—1. The combination, with the work-plate and needle of a sewing-machine, of a loop-forming device embracing a revolving plate having a marginal surface located adjacent to the needle and provided with peripheral recesses and movable pins or equivalent means engaging the cord and acting to draw the same into said recesses and to retain the cord-loops therein during the action of the stitching devices upon the cord, substantially as described.

2. The combination, with the stitch-forming devices of a sewing-machine, of a revolving plate provided with a series of marginal recesses, and means for drawing a cord into said recesses to form a series of loops, comprising swinging arms provided with pins entering the recesses and engaging the cord and a cam actuating said arms in the rotation of the plate, substantially as described.

3. The combination, with the stitch-forming devices of a sewing-machine, of a revolving plate D, provided with recesses *d d*, opening through the vertical marginal surface of the plate, a series of arms d^3 d^3, provided with pins d^4, entering the recesses, and with studs d^5 d^5, and a stationary cam-plate E, provided with cam-surfaces e' e^2 e^3, substantially as described.

4. The combination, with the stitch-forming devices of a sewing-machine, a revolving plate D, provided with marginal recesses opening through the vertical marginal surface of the plate, of a series of loop-holding pins movable into and out of said recesses, means for actuating said pins, and a guide for the cord directing the latter against the edge of the plate behind the pins, substantially as described.



5. The combination, with the stitch-forming devices of a sewing-machine and a loop-forming device embracing a circular revolving plate provided with peripheral recesses, and means for drawing a cord into said recesses to form a series of loops, of means for actuating said plate, embracing a ratchet on the plate and a reciprocating pawl actuated from the moving parts of said stitch-forming devices, substantially as described.

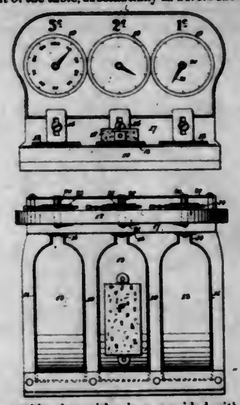
6. The combination, with the stitch-forming devices of a sewing-machine and a loop-forming device embracing a revolving plate provided with marginal recesses, a series of pins movable into and out of said recesses, swinging arms supporting the pins, and means for actuating said arms, of a spring adapted for engagement with said arms and constructed to act upon the finished strip to release the loops thereof from said pins, substantially as described.

413,854. COMBINED HAY RAKE AND STACKER. PETER HEISTE, Grand Island, Nebr. Filed Apr. 19, 1889. Serial No. 307,666. (No model.)

Claim.—1. The combination, with the main frame, of a forwardly-inclined lifting-frame journaled thereon near its rear upper end, and provided in rear of its pivotal point with an upwardly-projecting extension 30 and at its front end with a pivoted rake, a lifting-rope connected to the upper end of said extension, and a second rope connected with the rake for holding it in position while raking and rising, and permitting it also to dump, substantially as set forth.

2. The combination, with the main frame and the vertically-swinging lifting-frame journaled thereon, of a rake journaled on the forward end of the lifting-frame and having an upward-extending arm, an angle-lever mounted on the rear portion of the main frame and having an upwardly-extending member, and a connection between the upward-projecting member of said lever and the said rake-arm, substantially as set forth.

3. The combination, with the main frame and the vertically-swinging lifting-frame provided at its forward end with a dumping-rake having an upwardly-extending arm, of a lever journaled on the main frame and provided with an upwardly and a downwardly extending arm, means for locking the downwardly-extending arm to the main frame, and a connection between the upwardly-extending arm and the rake-arm.

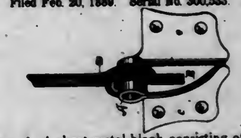


4. In a hay rake and stacker, the combination, with a base-frame and a perpendicular frame secured to the base-frame, of a lifting-frame fulcrumed upon the perpendicular frame, having an angular rear end overhanging the rear portion of the base-frame, a rake journaled in the forward end of the lifting-frame, an angled lever fulcrumed upon the perpendicular frame between the side bars of the lifting-frame, a rope connecting the angled lever and the rake, a drum journaled in the perpendicular frame, having a toothed head, a shaft journaled above said drum, provided with a pinion meshing with the head, a pulley secured to the rear end of the lifting-frame, a second pulley secured to the rear extension of the base-frame, and a rope secured to said rear extension, passing over the said pulleys, and connecting with the said drum, all combined for operation substantially as shown and described.

5. In a hay rake and stacker, the combination, with a portable frame, of an angular lifting-frame fulcrumed at the rear of its center, brace-rods connecting the members of the said frame, and a rake journaled in the forward end of the lifting-frame, and a rope connected with the rake for holding it in position while raking and rising and permitting it also to dump, all combined for operation as and for the purpose specified.

413,855. STAMP-REGISTER. ELTON B. HEFFNER, Bootner, Mo. Filed Apr. 26, 1889. Serial No. 308,679. (No model.)

Claim.—1. The combination, with the base 10 and the apertured plate 12, secured to the base and provided with a dial, of the post 20, journaled in the plate 12 and provided with the hand 21 and the ratchet-wheel 23, the table 13, pivoted to the base and projecting through the aperture of the plate 12, the dog 24, secured to the projecting end of the table and engaging the ratchet-wheel, and a pawl 25, for preventing backward movement of the ratchet-wheel, substantially as herein shown and described.



2. The combination, with the base 10 and apertured plate 12, provided with a dial, of the post 20, provided with the hand 21 and ratchet-wheel 23, the table 13, pivoted to the base and projecting through the aperture of the plate 12, the dog 24, secured to the end of the table, projecting through the said plate, a pawl for preventing the backward movement of the ratchet-wheel, and means for limiting the movement of the table, substantially as herein shown and described.

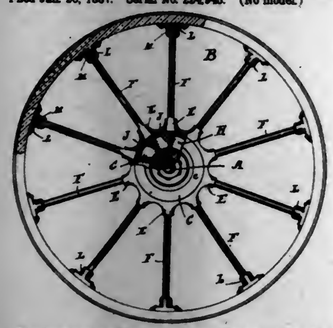
3. The combination, with a base provided with a series of depressions or recesses in its upper face, and a plate projected vertically from said base at the rear, having openings therein registering with the base-recesses, of a spring-actuated table pivoted at the forward end in each of the said recesses of the base, extending through the opening in the plate, a guide-plate adjustably held above each table, a dial produced upon the vertical plate over each of the tables, a post projected through each dial carrying an indicator at its outer end and a ratchet-wheel behind the dial, and a dog contacting with each of the said ratchet-wheels and secured to the table immediately below the same, substantially as and for the purpose specified.

4. The combination, with a base provided with a series of recesses in its upper face, a perpendicular plate projected upward at a right angle to the base at the rear, having openings therein registering with the base-recesses, a table pivoted at its forward end in each of the base-recesses, a spring secured to the base and bearing against the under face of each table, and a pad secured to the upper face of said tables, of a guide-plate adjustably held above each table, a dial produced upon the vertical plate over each of the tables, a post projected through each dial carrying an indicator at its outer end, and a ratchet-wheel behind the dial, and a dog contacting with each of the said ratchet-wheels and secured to the table immediately below the same, substantially as and for the purpose specified.

413,856. SHEET-METAL EAR FOR KETTLES, &c. FRED W. JUDD, Cleveland, Ohio, assignor to the Avery Stamping Company, of Ohio. Filed Feb. 20, 1889. Serial No. 300,533. (No model.)

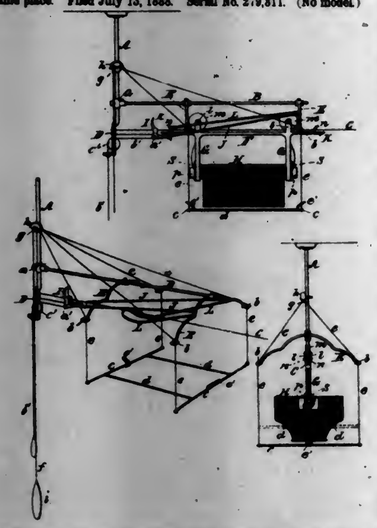
Claim.—1. A sheet-metal blank consisting of a rectangular part *a*, the ends *c c*, and the substantially-triangular intermediate parts *b b*, for the purpose specified.

2. A sheet-metal kettle-ear consisting of the vertical double rib B, having a hole *b'* and a cylindrically-bent part A upon its upper edge, and the wings *c c*, bent in opposite directions substantially at right angles to said rib, for the purpose specified.



413,857. RAIL-JOINT. STEVEN B. KINARD, JAMES B. MCKINLEY, and JAMES R. THAYER, Towaliga, Ga. Filed June 14, 1889. Serial No. 314,223. (No model.)

Claim.—1. The combination of the chair, the rails secured therein, and the springs secured to the chair and the rails, as set forth.



2. The combination of the chair having vertical flanges at its side edges, the rails fitting in the chair and having longitudinal slots, the bolts secured in the flanges of the chair and passing through the longitudinal slots of the rails, and the springs having their opposite ends secured to the rails and the chair, as set forth.

418,858. WHEEL FOR VEHICLES. HOSEA W. LIBBEY, Boston, Mass. Filed Jan. 20, 1887. Serial No. 224,943. (No model.)

Claim.—The herein-described vehicle-wheel, consisting of the hub comprising the two bands having flanges fitting together to provide a chamber, the two sets of springs arranged in said chamber, the spokes having their inner ends rigidly connected to the outer of said bands and their outer ends bearing against springs or cushions carried by the felly of the wheel, substantially as shown, and for the purpose described.

418,859. STORE-SERVICE APPARATUS. WILLIAM MENDENHALL, Cincinnati, Ohio, assignor to the Mendenhall Store Service Company, same place. Filed July 13, 1888. Serial No. 279,311. (No model.)

Claim.—1. In a store-service apparatus, a carrier having a hanger provided at its lower end with a hook rigid with the hanger, in combination with an elevator-frame and a detachable basket carried thereby and provided with a projection arranged, when the basket is elevated, to tilt the hook and hanger to one side and become automatically engaged with said hook, substantially as and for the purpose described.

2. In a store-service apparatus, a carrier having a hanger provided with a beveled lower side and an inclined slot to form a hook, in combination with an elevator-frame and a basket carried thereby and provided with a projection arranged, when the basket is elevated, to bear against the lower beveled side of the hanger to tilt the same and become automatically engaged therewith, substantially as and for the purpose described.

3. In a store-service apparatus, a carrier having a hanger provided with a beveled lower side and an inclined slot to form a hook, in combination with an elevator-frame and a basket carried thereby and provided with an inclined lug arranged, when the basket is elevated, to bear against the lower beveled side of the hanger to tilt the same and become automatically engaged therewith and rigidly held therein, substantially as and for the purpose described.

4. In a store-service apparatus, a carrier having a hanger provided at its lower end with a hook, and a latch extending over the point of said hook, in combination with an elevator-frame and a basket carried thereby and provided with a projection arranged, when the basket is elevated and lowered, to tilt the hook to one side and become automatically engaged therewith and disengaged therefrom, substantially as and for the purpose described.

5. In a store-service apparatus, a carrier having a hanger provided at its lower end with a hook and a gravitating-latch extending over the point of said hook, in combination with an elevator-frame and a basket carried thereby, and provided with a projection arranged, when the basket is elevated and lowered, to tilt the hanger to one side and become automatically engaged with and disengaged from said hook, substantially as and for the purpose described.

6. In a store-service apparatus, the carrier-hanger having a beveled lower side and provided with an inclined slot to form a hook, and a gravitating latch extending across the mouth of said slot, in combination with an elevator-frame and a basket carried thereby, and provided with a projection arranged, when the basket is elevated and lowered, to bear against the lower beveled side of said hanger to tilt the same to one side and become automatically engaged with and disengaged from said slot, substantially as and for the purpose described.

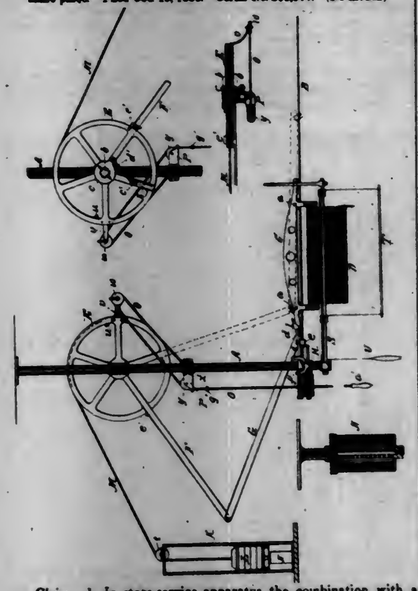
7. In a store-service apparatus, a carrier having a hanger provided with a beveled lower side and an inclined slot to form a hook, and a gravitating latch extending across the mouth of said slot, in combination with an elevator-frame and a basket carried thereby, and provided with an inclined lug arranged, when the basket is elevated and lowered, to bear against the lower beveled side of the hanger to tilt the same and become automatically engaged with and disengaged from said hook, substantially as and for the purpose described.

8. In a store-service apparatus, the carrier having the hangers G, provided at their lower ends with the hooks *r*, rigid therewith, and having beveled lower sides, in combination with an elevator-frame and the detachable basket H, carried thereby, and provided with legs *p*, arranged, when the basket is elevated, to bear against the lower beveled sides of the hooks and tilt the same to one side and become automatically engaged therewith, substantially as and for the purpose described.

9. In a store-service apparatus, the carrier having the two hangers G, one at each end of the carrier, and provided at their lower ends with hooks, and the latches S, extending over the points of said hooks, in combination with the elevator-frame and the basket H, carried thereby, and provided with lugs *p*, arranged, when the basket is elevated and lowered, to tilt the hooks to one side and become automatically engaged therewith and disengaged therefrom, substantially as and for the purpose described.

10. In a store-service apparatus, an elevator-frame composed of the bars *c d*, the former provided with guide-plate *d'*, in combination with a basket smaller at the bottom than at the top and adapted to fit between and be directly supported by said bars, substantially as described.

11. In a store-service apparatus, the combination, with the elevator frame composed of the bars *c d*, of the operating-cords *e*, bars E, provided with pulleys *b*, the grooved pulley *g*, covered by the guide-housing *h*, and the cord *f*, connected to the cords *e*, substantially as described.



12. In a store-service apparatus, the combination, with the carrier, of the bell-crank latch I, the springs J, connected to said latch by hooked pins *d'*, the pulley *c'*, and operating-cord *b'*, substantially as and for the purpose specified.

13. The carrier provided with the two hangers G, one at each end of the carrier, said hangers having the slots *g*, and latches *s*, pivoted to the lower end portions thereof, in combination with a basket having plates provided with inclined lugs *p*, and a suitable elevator for raising and lowering said basket, substantially as described.

14. The carrier provided with the hangers G, having the ribs *u*, upwardly-inclined hooks *r*, and inclined slots *q* at the lower end of said hangers, and latches connected to said hangers and confined in slots in said ribs, in combination with a basket having plates provided with inclined lugs *p*, and a suitable elevator for raising and lowering said basket, substantially as described.

15. In a store-service apparatus, the combination, with the track-wire C and the carrier mounted thereon, and provided with the upwardly-projecting propelling-forks *n*, of the upright support A, the laterally-extending arm B, the arm E, secured to the outer end of the arm B, the spring L, having its ends secured to the arm E and its loop resting on the track-wire C, the bell-crank latch I, the springs J, secured at one end to the bell-crank latch I and at the other to the arm E on opposite sides of the track-wire C, and the operating-cord *b'*, substantially as and for the purpose described.

413,860. STORE-SERVICE APPARATUS. WILLIAM MENDENHALL, Cincinnati, Ohio, assignor to the Mendenhall Store Service Company, same place. Filed Oct. 19, 1888. Serial No. 288,577. (No model.)

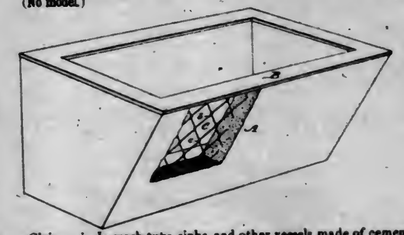
Claim.—1. In store-service apparatus, the combination, with a way and a carrier and receptacle adapted to move on said way, of a propelling-weight and a pusher arranged parallel to said way and connected to said weight, whereby upon lifting and releasing said weight the carrier and receptacle are given a gradually-increasing initial impetus for the purpose of propelling them on said way, substantially as described.

2. In store-service apparatus, the combination, with a way, a carrier and receptacle adapted to move on said way, and a catch for holding the carrier, of a propelling-weight and a pusher arranged parallel to said way and connected to said weight, whereby upon lifting and releasing said weight the catch is thereby disengaged and the carrier and receptacle are given a gradually-increasing initial impetus for the purpose of propelling them upon said way, substantially as described.

3. In store-service apparatus, the combination, with a way, a carrier and receptacle adapted to move on said way, a propelling-wheel or its equivalent, and a propelling-arm connected to said wheel and carried on said way, of a weight united by a rope to said wheel, whereby upon turning said wheel and lifting the weight and then releasing the same the carrier and receptacle are given a gradually-increasing initial impetus for propelling them upon said way, substantially as described.

4. In store-service apparatus, the combination of a way, a carrier and receptacle adapted to move on said way, a propelling-wheel, a propelling-arm connected to said wheel and carried on said way, a latch for said carrier, and a weight united by a rope to said wheel, whereby upon turning said wheel and lifting the weight and then releasing the same the latch is disengaged and the carrier and receptacle are given a gradually-increasing initial impetus for propelling them upon said way, substantially as described.

5. In store-service apparatus, the combination of a way, a carrier and receptacle adapted to move on said way, a propelling-wheel or its equivalent provided with an automatic spring locking and releasing bolt, a propelling-arm hung loosely by the side of said wheel, resting on said way, and a cord for rotating said wheel in one direction to cause its engagement with said arm and then in the opposite direction to propel the carrier and receptacle along the way and to effect the disengagement of the wheel and arm, substantially as described.



6. In store-service apparatus, the combination of a way, a carrier and receptacle adapted to move on said way, a propelling-wheel provided with an automatic spring locking and releasing bolt, a propelling-arm hung loosely by the side of said wheel and resting on said way, a weight secured by a rope to said wheel, and a cord for rotating said wheel in one direction to first cause its engagement with said arm and to lift the weight, whereby upon releasing said cord the weight rotates said wheel in the opposite direction and propels the carrier and receptacle along said way and causes the disengagement of the wheel and arm, substantially as described.

7. In store-service apparatus, the combination of a way, a carrier and receptacle adapted to travel on said way, and means for propelling the same, of the forked bracket H, with slotted arms *f g*, and the latch I, provided with the hook *m*, releasing-lug *f''*, slot *i*, and resetting-spring *j*, substantially in the manner and for the purpose specified.

8. A store-service apparatus comprising the weight L, air-cushion N, rope M, grooved wheel E, the jointed arms G F, the lug *e'*, secured to the arm F, the spring-bolt *c'* upon the wheel E, washer *c*, spring *d'*, and lifting-cord O, attached to the wheel E, substantially as and for the purpose specified.

9. A sliding pivoted spring-retracted latch-piece having an inclined lug, in combination with a bearing for said latch-piece, whereby the drawing forward of said latch-piece causes it to be tilted to effect its disengagement, substantially as described.

413,861. SINK, &c., MADE OF CEMENT. JOHN MOORE, East New Durham, assignor to himself, Alphonse Thourot, Union, and John Darling, West New York, N.J. Filed Sept. 16, 1889. Serial No. 324,005. (No model.)

Claim.—1. In wash-tubs, sinks, and other vessels made of cement or cement composition, the combination, with the cement body of the vessel, of a metallic frame composed of an outer or exposed metal cap-strip exterior to the cement and extending over or around the top or rim of said body, and a wire-netting fixedly united above to said cap-strip and embedded within the cement throughout the sides, ends, and bottom of the vessel, substantially as specified.

2. The combination, with the cement body A of the vessel, of the exposed unembedded metal cap-strip B on the top or rim of said body, and the wire-netting C, embedded within the cement throughout the sides, ends, and bottom of the vessel, and composed of interwoven wires *b*, fixedly united at their upper ends with the cap-strip and connected with each other where crossing one another, essentially as and for the purposes herein set forth.

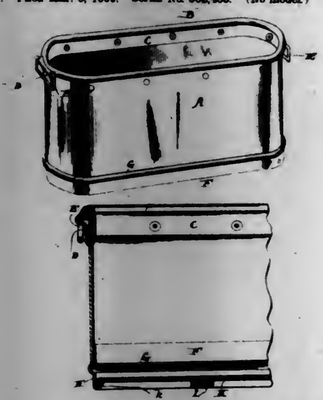
3. The combination, with the cement body A of the vessel, of the exposed continuous upper metal cap-strip B, exterior to the cement, and the wire-netting C, composed of interwoven wires *b*, fixedly united at their upper ends with the cap-strip and connected with each other where crossing one another, as at *c*, also where meeting below, as at *c'*, and the end wires *f* of the frame, said wires *b* and *f* all being united with each other and being embedded within the cement of the body throughout the sides, ends, and bottom of the vessel, substantially as shown and described.

413,862. BOOT OR SHOE HEEL. ERNEST A. MUDGE, Beaver Dam, Wis., assignor to George E. Swan, same place. Filed May 8, 1888. Renewed May 10, 1889. Serial No. 310,357. (No model.)

Claim.—1. The improved heel herein described, comprising two sections A and B, a cushion arranged between said sections, and connections fixed at one end to one of such sections and extended and

secured at their opposite ends in openings in the other section, such openings being sufficiently larger than the portions of the connections fitted therein to permit lateral play of the connections in said openings, whereby the sections A B may move laterally independent of each other, substantially as set forth.

2. In a heel, the combination of a cushion having sockets or openings which open or lead out of its opposite sides or faces, two sections or plates fitted against the opposite sides or faces of the cushion, such sections or plates being provided on their faces next the cushion with studs or projections which enter the openings of the cushion, and connections between the plates or sections, substantially as set forth.



3. The improved heel herein described, comprising the upper section or plate formed with a recess or socket in its upper face and having the wall or rim-flange thereof provided on its edge with prongs or spurs, the lower section or plate, the cushion, and connections, substantially as and for the purposes specified.

4. As an improved article of manufacture, the heel, substantially as described, consisting of the upper section or plate having its upper side recessed and provided on its under side with downwardly-extended studs or projections, the cushion having sockets or openings fitted to receive said studs, the lower plate or section, and connections, substantially as set forth.

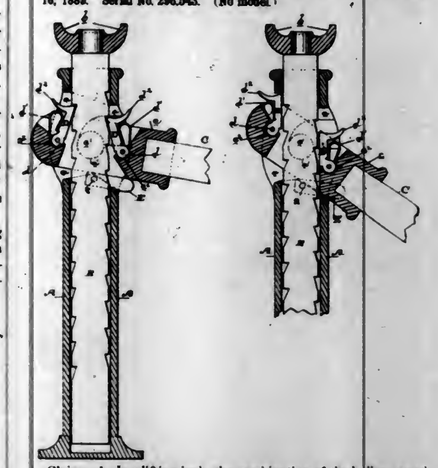
5. In a heel, the combination of the plate A, having in its lower face the recesses A^3, the plate B, having in its upper face recesses B^3, the cushion arranged between the plates A B and having sockets or openings registering with recesses A^3 B^3, and the studs A' B', extended from plates A B into the sockets of the cushion, with their extremity arranged to enter the recesses of the opposite plate when the cushion is compressed, substantially as and for the purposes specified.

6. The heel herein described, consisting of the section A, having openings *c*, countersunk at *c'*, and the projections A', extended from its under side, the cushion C, and the lower plate B, having projections B' and connecting-posts E, and the washers c^2 c^2, substantially as set forth.

413,863. **METALLIC VESSEL.** DEWITT C. MCINTIRE, Salamanca, N. Y. Filed Mar. 8, 1889. Serial No. 302,483. (No model.)

Claim.—1. In a metallic vessel, the combination, with the body, of a vertical strengthening-band fitting within the lower end of the same and having an annular bead to support the lower edge of the body, and transverse braces to support the bottom, substantially as set forth.

2. In a metallic vessel, the combination, with the body, of a vertical strengthening-band fitting within the lower end of the same and having an exterior annular bead to support the lower edge of said body, and an inwardly-turned or struck-up flange forming a groove to afford a seat for the bottom on the side of the strengthening-band opposite to the bead which supports the body, substantially as set forth.



3. In a metallic vessel, the combination, with the body, of a vertical strengthening-band fitting within the lower end of the same and having an annular inturned or struck-up flange forming a groove to afford a seat for the bottom, and transverse bottom-supporting bars or braces, substantially as set forth.

4. In a metallic vessel, the combination, with the body, of the band fitting within the lower edge of the body and provided with a groove H at its lower edge, the transverse bars L L, connected to the lower edge of the band, and the bottom bearing on the said bars and provided at its edge with a flange *k*, fitting in the groove H, substantially as specified.

5. In a metallic vessel, the combination, with the body, of a bottom attaching and re-enforcing device comprising a band fitting in the lower end of the body and having a bead to support the lower edge of the same, an annular flange forming a groove to receive the bottom, and transverse braces connecting the said annular flange, substantially as set forth.

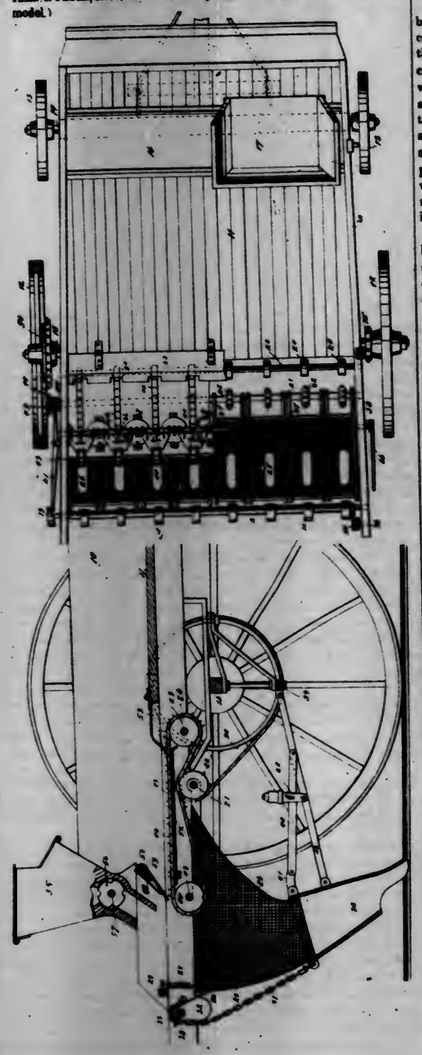
6. A metallic vessel comprising the body, the annular re-enforcing bands fitted in the upper and lower ends of the same, and the bottom having a downturned flange seated in a groove formed by an upturned flange at the lower end of the bottom-re-enforcing band, substantially as set forth.

413,864. **LIFTING-JACK.** EMORY I. NICHOLS, San Francisco, Cal., assignor to the Nichols Manufacturing Company, same place. Filed Jan. 16, 1889. Serial No. 296,543. (No model.)

Claim.—1. In a lifting-jack, the combination of the hollow standard, vertically-movable lifting-bar therein having teeth on each side, vibrating lever pivoted in the standard, pawls carried by the lever and engaging alternately the teeth of the lifting-bar, and a movable stop-piece on the standard for limiting the movement of the lever when operating and allowing, when turned out of the way, its further movement, whereby its pawls are thrown from and held out of engagement with the teeth of the lifting-bar, substantially as described.

2. In a lifting-jack, the combination of the hollow standard having the slotted top with bearing-shoulders therein, the operating-lever, the head of which is slotted and passes through the slotted top of the standard, said head having side pivot pins or lugs seated in the bearing-shoulders of the standard, and having also bearing-shoulders for the pawls, the lifting-bar seated in the hollow standard and passing through the slotted head of the operating-lever, said lifting-bar having ratchet-teeth on both sides, the spring-controlled pawls having bases seated in the bearing-shoulders of the lever-head and adapted to engage the teeth of the lifting-bar, and the movable stop-piece E in the standard-top for limiting the movement of the lever-head when operating and allowing, when turned aside, its further movement, whereby the pawls are thrown from and held out of engagement with the teeth of the lifting-bar, substantially as described.

413,865. **SPIROMETER.** SETH W. PAINE, Rochester, N. Y. Filed Jan. 12, 1889. Serial No. 296,190. (No model.)



Claim.—1. In a lung-developer, the combination, with a yoke consisting, essentially, of two side arms connected at the top, and a tube secured to the top of the yoke, of a wheel journaled on a pin supported in the free ends of the yoke and provided with concentric flanges around its periphery, and buckets located between the flanges and arranged to pass in close proximity to the end of the tube, substantially as set forth.

2. In a lung-developer, the combination, with a yoke carrying a tube, of an axle journaled in the yoke, a bucket-wheel rigidly secured to the axle, a movable indicator-wheel journaled on one arm of the yoke, and gearing connecting the axle and indicator-wheel, substantially as set forth.

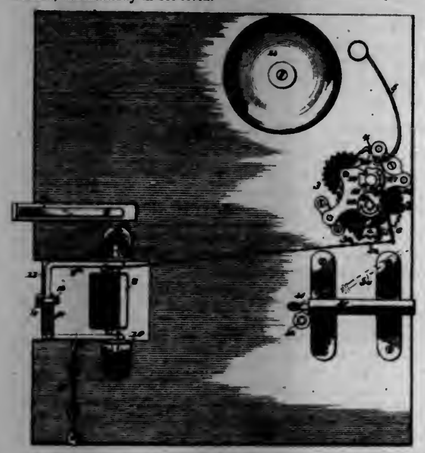
3. In a lung-developer, the combination, with a yoke carrying a tube, of an axle journaled in the yoke, a bucket-wheel rigidly secured to the axle, an indicator-wheel journaled on one arm of the yoke, and worm-gearing between the axle and indicator-wheel for imparting motion from the former to the latter, substantially as set forth.

413,866. **SEED-DRILL AND FERTILIZER-DISTRIBUTER.** JONATHAN C. PEDEN, Rose, Mo. Filed May 23, 1889. Serial No. 311,708. (No model.)

Claim.—1. The combination, with a vehicle-body provided with a partial bottom, a series of laterally-movable conductors suspended from the body, hoes contacting with said conductors, and a rock-shaft secured in the rear of the vehicle-body provided with cam-blocks, of a chain attached to each hoe and passing over one of the cam-blocks, a crank-arm secured to the said rock-shaft, a lever fulcrumed upon the body, a link connecting the crank-arm and lever, and means, substantially as shown and described, for locking the said lever, as and for the purpose specified.

2. The combination, with a vehicle-body provided with a partial bottom, a shaft journaled in the sides of the body, conductors pivoted at one end upon said shaft and suspended from the body at the opposite end by springs, a hoe contacting with each conductor, a rock-shaft journaled in the rear of the body and provided with a series of cam-blocks, and chains attached to the several hoes and passing over the said cam-blocks, of endless carrying-belts held to travel above the conductors, a platform supported beneath the said belts, a lever fulcrumed upon one side of the vehicle-body, a link-connection between the rock-shaft and lever, and means, substantially as shown and described, for locking the lever, as set forth.

3. The combination, with a vehicle-body provided with a partial bottom, a shaft journaled in the sides of the body, laterally-movable conductors pivoted at one end upon the said shaft and suspended from the body at the opposite end by springs, a hoe contacting with each conductor, a rock-shaft journaled in the rear of the body provided with a series of cam-blocks, and chains attached to the several hoes and passing over the said cam-blocks, of endless carrying-belts held to travel one over each conductor, a platform supported beneath the series of belts, a shaft journaled in the sides of the body above the said carrying-belts, gates secured to the said shaft above each chain, partitions between the gates, a lever fulcrumed upon one side of the vehicle-body, a connection between said lever and the rock-shaft, and means, substantially as shown and described, for actuating the carrying-belts, all combined for operation as set forth.



4. The combination, with a vehicle-body provided with a partial bottom, a shaft journaled in the sides of the body, conductors pivoted at one end upon the said shaft and suspended from the body at the opposite end by springs, a hoe contacting with each conductor, a rock-shaft journaled in the rear of the body and provided with a series of cams, and chains attached to the several hoes and conductors and passing over the said cam-blocks, of endless chain belts held to travel over each of the conductors, a platform passing beneath the several chain belts, a shaft journaled transversely in the body beneath the belts and carrying sprocket-wheels engaging with the said belts and at one end provided with a fixed clutch-section and a sliding clutch-section, a cam-wheel secured upon one end of the rock-shaft, a forked lever pivoted upon the vehicle-body and engaging the cam-wheel and the sliding clutch-section, a shaft carrying a series of spring-actuated gates, one gate located over each chain belt, partitions between the gates, a lever fulcrumed upon one side of the vehicle-body and connected with the rock-shaft, substantially as shown and described, whereby, when the said rock-shaft is manipulated, the sliding clutch-section will be also manipulated, as and for the purpose specified.

5. The combination, with a vehicle-body provided with a partial bottom, a shaft journaled in the sides of the body, conductors pivoted at one end upon the said shaft and suspended from the body at the opposite end by springs, a hoe contacting with each conductor, a rock-shaft journaled in the rear of the body provided with a series of cam-blocks, and chains attached to the several hoes and conductors and passing over the said cam-blocks, of a series of endless carrying-chains supported one over each conductor, a platform passing horizontally beneath the several carrying-belts, a shaft provided with sprocket-wheels engaging each of the said carrying-belts and having a fixed and a sliding clutch-section at one end, a cam-wheel secured to one extremity of the rock-shaft, a lever contacting with the cam-wheel and sliding clutch-section, a shaft carrying a series of spring-actuated gates, one gate located over each carrying-belt, partitions between said gates, a seed-box supported over each of the conductors and provided with a distributing-wheel secured upon a common shaft, an apron hinged to the fixed bottom of the vehicle-body and resting upon the platform located beneath the endless carrying-belts, a lever fulcrumed to one side of the vehicle-body, a link-connection between the said lever and rock-shaft, and a connection, substantially as shown and described, between the said lever and the shaft carrying the distributing-wheels of the seed-boxes, and means for actuating the carrying-belts and the seed-distributers from the axle of the vehicle-body, as and for the purpose specified.

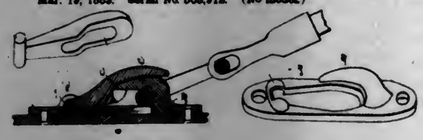
413,867. **BURGLAR-ALARM.** CALEB C. REID, New Burnside, Ill. Filed June 20, 1889. Serial No. 315,014. (No model.)

Claim.—1. The combination of the bell, the clock mechanism having on its escapement-shaft the hammer and the arm 6, the pivoted arm, the chain 7, connecting the pivoted arm and the arm 6, and the

pivoted trigger having the hooked upper end adapted to engage the pivoted arm and arranged to be operated by the opening door or window, substantially as set forth.

2. The combination of the bell, the clock mechanism having on its escapement-shaft the hammer and the arm 6, the arm having the serrated plate on its free rounded end and having at its lower end the curved frame 8^a, pivoted on the rod 9, the spring 18, arranged to throw down the arm 8, the pivoted trigger having the hooked upper end engaging the curved frame 8^a and arranged to be operated by the opening door or window, the lamp, the match-holder, and the match placed in the same, substantially as set forth.

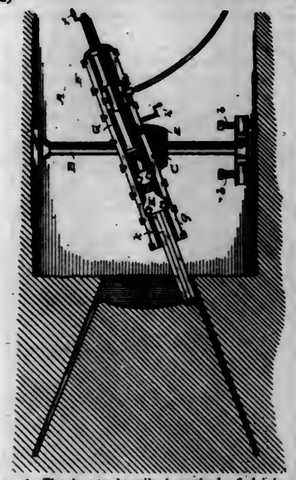
3. The combination of the bell, the clock mechanism having on its escapement-shaft the hammer and the arm 6, the arm having the serrated plate on its free rounded end and having at its lower end the curved frame 8^a, pivoted on the rod 9, the spring 18, arranged to throw down the arm 8, the pivoted trigger having the hooked upper end engaging the curved frame 8^a and arranged to be operated by the opening door or window, the lamp, the match-holder, the match placed in the same, and the reflector, substantially as set forth.



4. In a burglar-alarm, the combination, with the bell, the clock mechanism having on its escapement-shaft the hammer and the arm 6, and the arm 8, having the pivoted frame 8^a at its lower end and connected by a chain 7 to the arm 6, of the pivoted trigger 12, having the hooked upper end engaging the pivoted frame 8^a and formed with the longitudinal slot 13, the slotted rod 15, having the rounded lower end, and the guide-rod 14 at its upper end, and the spring 16, substantially as set forth.

5. In a burglar-alarm, the combination, with the clock mechanism having on its escapement-shaft the arm 6, the pivoted arm 8, connected by a chain 7 to the arm 6, and having the serrated plate on its curved free end, the trigger engaging the arm, and the lamp 22, of the horizontal tubular match-holder 21, having the spiral spring 24 and loose disk 23^a in its closed end, substantially as set forth.

6. In a burglar-alarm, the combination, with the bell, the clock mechanism having on its escapement-shaft the hammer and the arm 6, and the arm 8, connected by a chain 7 to the arm 6, and having the pivoted frame 8^a at its lower end, of the trigger pivoted on the rod 11 and having the hooked upper end engaging the frame 8^a, and the spring 30, coiled on the rod 11 and engaging the pivoted trigger, substantially as set forth.



7. In a burglar-alarm, the combination, with the bell, the clock mechanism having on its escapement-shaft the hammer and the arm 6, and the arm 8, connected by a chain 7 to the arm 6, and having the pivoted frame 8^a at its lower end, of the pivoted trigger engaging the frame 8^a, and the sliding rod 31, adapted to engage the frame 8^a, substantially as set forth.

413,868. TRACE-CARRIER. Hiram Rosmon, Garwood, Pa. Filed Mar. 19, 1889. Serial No. 303,912. (No model.)

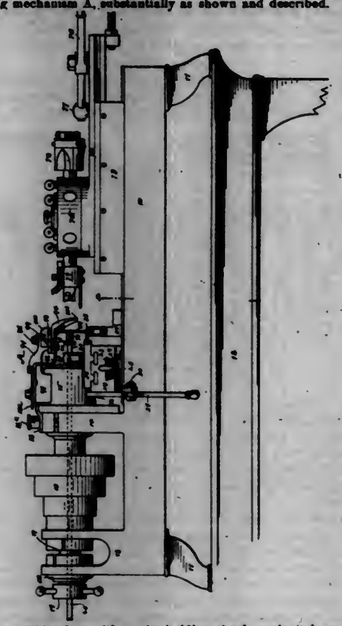
Claim.—As an improved article of manufacture, a trace-support consisting of the apertured plate A, provided with the outwardly and upwardly projecting hook B and with the socket *a* above the hook, and the tongue C, having a rounded outer surface and provided with the T-shaped end *b* to enter the socket and the recess *c* in its inner surface for inclosing the point of the hook, as specified.

413,869. METHOD OF DRIVING TUNNELS. William L. Saunders, New York, N. Y. Filed May 10, 1888. Serial No. 273,286. (No model.)

Claim.—1. The herein-described method of driving tunnels of small sectional area in hard rock, which consists in making a first cut in the form of a narrow open channel driven into and across the face of the rock or heading and without the use of explosives, then placing surrounding or adjacent drill-holes and blasting out the material between the channel and the wall or walls of the tunnel after the channel has been completed, substantially as described.

2. The herein-described improvement in the art of driving shafts or headings of small sectional area in hard rock, which consists in making a first cut in the shape of a narrow open channel driven into and across the face of the rock or heading to the depth of the cut and without the use of explosives, then placing surrounding or adjacent drill-holes and blasting out the material between the channel and the walls of the shaft or heading after the channel has been completed, substantially as described.

3. The herein-described method of driving tunnels of small sectional area in hard rock, which consists in making a first cut in the form of a narrow open channel extending across the face of the rock or heading and of the depth of the proposed cut, said channel dividing or separating the material to be removed, and placing surrounding or adjacent drill-holes and blasting out the material between the channel and the wall or walls of the tunnel, substantially as described.



4. The herein-described improvement in the method of boring or tunneling hard rock, which consists in cutting an open groove or channel into and across the face of the heading and simultaneously drilling holes for the reception of explosives in the material between the channel and the wall or walls of the bore, substantially as described.

413,870. LATHE ATTACHMENT FOR MAKING METAL SCREWS. John H. Severance, Readville, assignor to the Lockie Button and Manufacturing Company, Boston, Mass. Filed May 16, 1889. Serial No. 311,084. (No model.)

Claim.—1. The combination, with a wire-holding chuck and a pivoted gage pivoted in advance of the chuck, of a sliding carriage carrying a turret, and reamers horizontally projected from the turret, provided with a horizontal finger upon their under side capable of contact with the gage, substantially as shown and described.

2. The combination, with a wire-holding chuck and a pivoted gage located in front of the chuck, of a sliding carriage carrying a turret, and reamers horizontally projected from the said turret, provided with a horizontal finger secured to the under side of their body, having one curved and one straight edge, and an angle trip-bar secured upon the top of said body, and the trip mechanism A, substantially as shown and described.

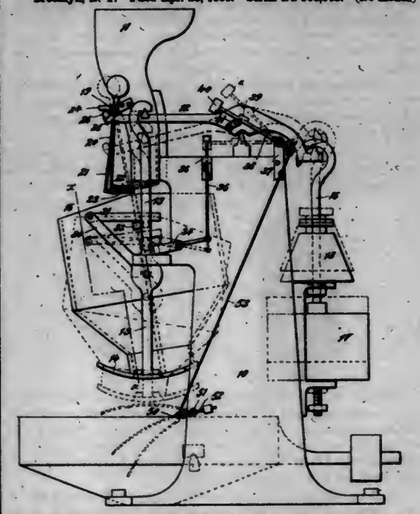
3. The combination, with a wire-holding chuck, a pivoted gage located in front of the chuck, a sliding carriage, and a revoluble turret mounted upon said carriage, of reamers horizontally secured in the turret, provided with a finger horizontally attached to the under side, an angle trip-bar adjustably attached to the upper side of the reamer-body, the vertical member whereof extends beyond the front of the body and is provided with a groove in its outer surface, and the tripping mechanism A, substantially as shown and described.

4. The combination, with a wire-holding chuck, a pivoted gage located in front of the chuck, a carriage sliding in front of the gage, and a revoluble turret mounted upon said carriage, of reamers horizontally held in the turret, provided with a finger projected from their under face capable of contact with the gage, and a second carriage sliding beneath the wire-holding chuck and at the rear of the gage, and cutters adjustably held upon said carriage, all combined for operation substantially as set forth.

5. The combination, with a wire-holding chuck and the trip mechanism A, extending over and beyond the chuck, of a die-head provided with pivoted jaws, and a revolving cam-ring surrounding the jaws, having pins projected therefrom for contact with the trip mechanism, substantially as set forth.

6. The combination, with a wire-holding chuck and the trip mechanism A, of a sliding carriage, a turret mounted upon the carriage, and die-heads horizontally supported in said turret, comprising a body, jaws pivoted in the body, a loosely-mounted cam-ring inclosing and contacting with the jaws, and pins projected from the outer periphery of the ring, substantially as shown and described, and for the purpose specified.

7. The combination, with a wire-holding chuck, a gage pivoted in front of the chuck, a knife-carriage sliding below the chuck, and an arm attached to the carriage capable of setting the gage, of a reamer comprising a tubular body and a finger projected from the under surface of its body beyond its front face and capable of displacing the gage, substantially as shown and described.



8. The combination, with a wire-holding chuck, a gage pivoted in front of the chuck, a knife-carriage sliding below the chuck, and an adjustable arm projected longitudinally from one side of the carriage to set the gage, of a second carriage sliding in front of the chuck, a revoluble turret mounted upon the said second carriage, and reamers supported in the turret, comprising a tubular body and a finger having one straight and an opposite curved edge secured to the under face of the body and extending beyond its front, substantially as shown and described.

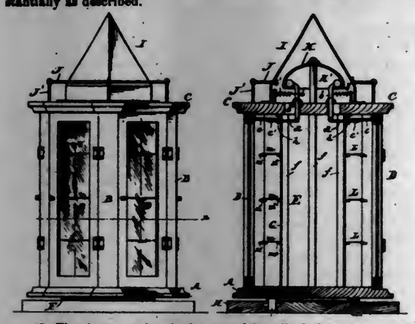
9. The combination, with a wire-holding chuck and the tripping mechanism A, located above the chuck, of a sliding carriage, a turret mounted upon the carriage, and reamers and die-heads alternately secured in the turret, the reamers comprising a tubular body and an angled trip-bar adjustably secured to the upper face of the same at its front, the die-heads comprising a body containing pivoted jaws, a loosely-mounted cam-ring surrounding and clamping the jaws, and pins projected from the said ring, all combined for operation substantially as specified.

10. The combination, with a wire-holding chuck, the tripping mechanism A, a gage pivoted in front of the chuck, a carriage sliding in front of the gage, and a turret mounted upon said carriage, of reamers and die-heads alternately arranged in said turret, the reamers comprising a tubular body, a finger projected from the bottom of the body, and an angle trip-bar adjustably secured upon the top of the same, and the die-heads consisting of a body portion provided with pivoted jaws, a loosely-mounted cam-ring clamping the jaws, and pins projected from the said ring, all combined for operation substantially as specified.

11. The combination, with a die-head comprising a body portion provided with pivoted jaws, a cam-ring loosely mounted upon the body surrounding the jaws, and pins projected from the said ring, of a tripping device comprising a body portion provided with a neck, a spring-actuated locking-plate having a shoulder 97 upon its under side and pivoted to the neck, a spiral cam-finger projected from the said locking-plate, and a spring-actuated angle tripping-arm provided with a pin projecting from its upper surface near its outer edge, substantially as shown and described.

413,871. ATTACHMENT FOR GRAIN-SCALES. James H. Shelley, Brooklyn, N. Y. Filed Apr. 25, 1889. Serial No. 308,565. (No model.)

Claim.—1. The combination, with a plate arranged to be pivotally supported beneath the discharge-orifice of the grain-scales, of a weighted lever formed with a lateral projection and arranged for pivotal connection with the scale-standard, a latch-tripping lever also arranged for pivotal connection with the standard, and connections such that the falling of the weighted lever will actuate the latch-tripping lever, substantially as described.



2. In grain-measuring scales, the combination, with a pivotally-mounted leaf or plate, of weighted levers, connections between the plate and the levers, projections carried by the levers, projections carried by the scale-beam upon which the lever projections rest, a tilting bucket, a latch arranged in connection therewith, a latch-tripping lever, and an upwardly-extending stem carried by the latch-tripping lever, substantially as described.

3. In grain-measuring scales, the combination, with a tilting bucket provided with projections 32, of latches 31, supported substantially as described, latch-tripping levers 34, upwardly-extending stems 35, carried by the levers, weighted levers 38, formed with projections 39, projections 41, carried by the scale-beam, a plate 50, and connections, substantially as described, between the plate and the weighted levers, as and for the purpose stated.

413,872. SHOW-CASE. Andrew B. Shipman, Columbus Junction, Iowa. Filed May 23, 1889. Serial No. 311,835. (No model.)

Claim.—1. A show-case comprising a base and top board united

by a series of outer vertical posts and a series of inner vertical posts, in combination with an inner wall surrounding the series of inner vertical posts, outer doors hinged to the outer posts, and the horizontal supports L, arranged between the outer and inner series of posts, substantially as described.

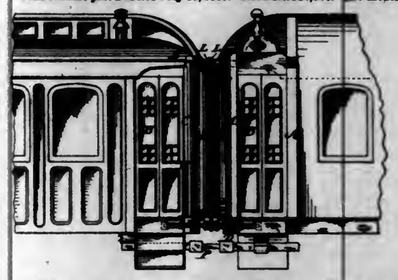
2. The show-case herein shown and described, the same consisting of a base and top board united by an inner and outer series of vertical posts, in combination with a dome mounted upon the top board, a gong placed therein, doors hinged to the outer posts, and striking mechanism connected to the doors and top board for sounding the gong upon the opening of any one of the doors, substantially as described.

3. The door D, having the arm *c*, formed with a rounded enlargement *c'*, in combination with the bell K, spring-actuated hammer *b*, link *d*, pivoted to the hammer, and the spring *h*, the said link being formed with a loop *d'*, substantially as described.

413,873. LUBRICATOR. MELVIN SHOLL, Terrace, Utah. Filed June 20, 1889. Serial No. 314,934. (No model.)

Claim.—1. In a lubricator, the combination of a reservoir having an escape-opening provided with a valve-seat and a cross-bar having a vertical screw-threaded perforation, a screw-threaded stem working in the latter and having a valve at its lower end, and a spring arranged to so bear against the said stem as to hold the valve in a closed position, substantially as set forth.

2. In a lubricator, the combination of a reservoir having an escape-opening, a valve to close the said escape-opening, and a spring to hold the said valve in a closed position, substantially as set forth.



3. In a lubricator, the combination of a reservoir having an escape-opening, a valve to close the latter, said valve being mounted upon a screw-threaded stem working in a screw-threaded bearing, and a spring arranged to so rotate the said valve-stem as to keep the valve in a closed position, as set forth.

4. In a lubricator, the combination of a reservoir having an escape-opening, a screw-threaded stem working in a suitable bearing and having a valve adapted to close the said opening, a spring arranged to so rotate the valve-stem as to keep the valve in a closed position, and a cover for the said reservoir, having an interiorly-located boss or projection provided with a recess to receive the upper end of the valve-stem and a groove to accommodate a stud extending laterally from the latter, substantially as set forth.

5. In a lubricator, the combination of a reservoir having an escape-opening, a screw-threaded stem working in a suitable bearing and having a valve adapted to close the said opening, a spring arranged to so rotate the valve-stem as to keep the valve in a closed position, a cover for the said reservoir, having an interiorly-located boss or projection provided with a recess to receive the upper end of the valve-stem and a groove to accommodate a stud extending laterally from the latter, a series of notches formed in the lower edge of the cap or cover, and a stud extending laterally from the cap or reservoir to engage the said notches, substantially as set forth.

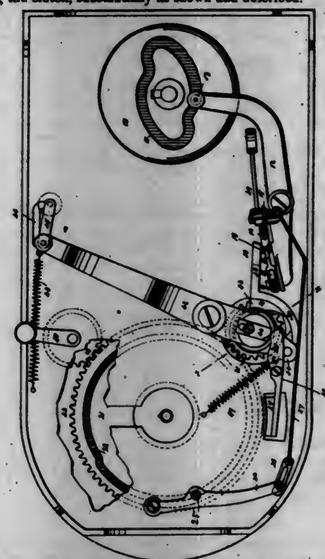
6. In a lubricator, the combination of a reservoir having an escape-opening, a screw-threaded stem working in a suitable bearing and having a valve adapted to close the said bearing, a spring arranged to so rotate the said valve-stem as to keep the valve in a closed position, a lug or stud extending laterally from the cap or reservoir, a lug or stud extending laterally from the valve-stem, and a cap or cover having a series of notches at its lower edge, a vent-opening at its upper end, and an interiorly-located boss or projection having a recess to receive the upper end of the valve-stem and a groove to accommodate the lug or stud of the latter, substantially as set forth.

413,874. VESTIBULE RAILWAY-CAR. RENALDO SHARP, Brooklyn, N. Y., assignor of two-thirds to John W. Howard and David R. Morse, both of same place. Filed July 13, 1889. Serial No. 317,378. (No model.)

Claim.—1. The combination, in a railway-car, of a threshold buffer-plate oscillating upon a vertical axis movable longitudinally to the car, a transom-plate similarly movable, and vertically-pivoted connecting-flanks, to the movable extremities of which the extremities of the said plates are swiveled in common vertical axes to receive corresponding advancing, retracting, or oscillating movements simultaneously.

2. The combination, with the vestibuled end of a railway-car, of a threshold buffer-plate oscillating upon a vertical axis movable longitudinally to the car, a transom-plate similarly movable, and vertically-pivoted connecting-flanks inclosing the sides of the spaces that intervene adjacent cars, to the movable extremities of which flanks the extremities of the said plates are swiveled in common vertical axes and present abutting surfaces in a common plane with the abutting surfaces of the said flanks for the purpose of forming contact with a corresponding structure of an adjacent car.

3. The combination, in a railway-car, of a threshold buffer-plate, a transom-plate, guide-bolts sliding in bearings longitudinally to the car, to which guide-bolts the said plates are swiveled to oscillate, buffer-springs for advancing the threshold-plates, and vertically-pivoted connecting-flanks, to the movable extremities of which the extremities of said plates are swiveled in common vertical axes, whereby the oscillation of the threshold-plate and the advancement of the same by the buffer-springs is imparted to the transom-plate.



4. The combination, with the adjoining ends of railway-cars, of vestibule-extensions communicating to form a continuous passage, offset walls extending laterally from the outposts of the vestibule, flanks extending the height of the vestibules vertically pivoted at the extremities of said walls and inclining at their movable extremities (in horizontal cross-section) toward the center of the cars and toward a plane of contact with one another, threshold buffer-plates, and transom-plates oscillating upon vertical axes movable longitudinally to the cars to abut at said plane of contact, the movable extremities of the flanks being swiveled to the extremities of said plates, substantially as and for the purposes set forth.

5. The combination, in the vestibuled end of a railway-car, of a threshold buffer-plate and transom-plate, both oscillating upon a vertical axis movable longitudinally to the car, vertically-pivoted flanks supplementing the interval of the vestibule and a plane of junction of an adjoining car, said flanks having convex or rolling contact-surfaces co-operative in the manner specified with the flanks of such adjoining car, swivel-studs in the movable extremities of the flanks and slots in the extremities of the said threshold, and transom-plates with which the studs engage, as and for the purposes set forth.

6. The combination, in a railway-car, of a movable threshold buffer-plate, a movable transom-plate, and pivoted connecting-flanks that inclose the sides of the space that intervene adjacent cars.

413,875. FEED MECHANISM FOR BUTTON-HOLE SEWING-MACHINES. RUDOLPH STAHL, Brooklyn, N. Y. Filed June 19, 1888. Serial No. 277,502. (No model.)

Claim.—1. In a button-hole sewing-machine, the combination, with a feed-wheel having a toothed periphery and a feed-lever connected with the driving mechanism, of a hubbed pinion meshing with the feed-wheel, a collar surrounding the hub of the pinion and having side apertures, a clutch-arm pivoted to said collar and provided with lugs for alternately engaging the hub of the pinion, a spring for returning the clutch-arm to its normal position, a trip-lever fulcrumed upon the feed-lever, and spaced blocks upon said trip-lever alternately engaging the clutch, substantially as shown and described.

2. In a button-hole sewing-machine, the combination of a feed-wheel having a toothed periphery, a feed-lever connected with the driving mechanism, a hand lever, a pinion carried by the hand-lever and meshing with the feed-wheel, a clutch operating the pinion, a trip-lever pivoted to the feed-lever and provided with blocks alternately engaging the clutch, a second pinion meshing with the feed-wheel, and a crank-handle for operating the said second pinion, substantially as and for the purpose set forth.

3. In a button-hole sewing-machine, the combination, with a feed-wheel having a toothed periphery, a feed-lever connected with the driving mechanism, a weighted trip-lever fulcrumed upon said feed-lever, and spaced blocks attached to the trip-lever, of a hubbed pinion meshing with the feed-wheel, a collar surrounding said hub and provided with side apertures, a clutch-arm pivoted to said collar alternately engaged by said blocks, and a hand-lever, substantially as shown and described, connected with the hub of said pinion, as and for the purpose specified.

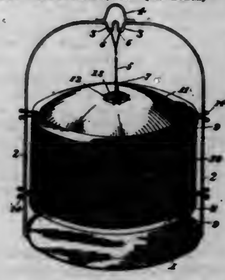
4. In a button-hole sewing-machine, the combination, with a feed-wheel having a toothed periphery, a feed-lever connected with the driving mechanism, a weighted trip-lever fulcrumed upon said feed-lever, and spaced non-aligning blocks secured upon the trip-lever, of a hubbed pinion meshing with the feed-wheel, a collar loosely surrounding said hub, a clutch pivoted to said collar and alternately engaged by said blocks, a hand-lever connected with said pinion, a slide adjustably held upon the hand-lever, and a brake-lever engaging said slide, substantially as shown and described.

413,876. OIL-CAN. LE GRAND TERRY, Horseheads, N. Y. Filed June 15, 1889. Serial No. 314,460. (No model.)

Claim.—1. In an oil-can, the combination, with a can, a tube extending out of the latter, and a plug or stopper connected with the tube, of an adjustable sleeve adapted to slide over the tube and receive the stopper therein, whereby the discharge of oil is regulated, substantially as set forth.

2. The combination, with a can having an oil-outlet therein, and a plug or stopper connected with the can and located over the opening, of an adjustable sleeve adapted to slide over the opening and plug or stopper, whereby the discharge of the oil is regulated, substantially as set forth.

3. The combination, with a can having an oil-outlet therein, and a plug or stopper connected with the can and located over the opening, of an adjustable sleeve adapted to slide over the opening and plug or stopper and an air-tube leading from the bottom of the can to its upper end, substantially as set forth.



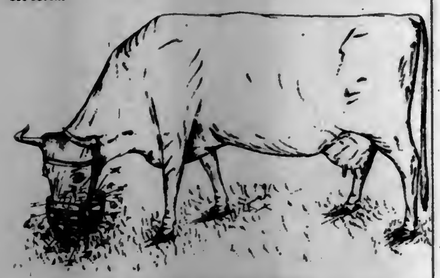
4. The combination, with a can, a tube thereon, and a plug or stopper yieldingly connected to the tube, of an adjustable sleeve having a small opening at its upper end, said sleeve adapted to slide over the tube and be closed by the plug, substantially as set forth.

5. The combination, with a can, a flanged collar thereon, and an air-tube leading from the bottom of the can to the top inside of the collar, of a discharge-tube attached to the top of the can, a plug connected thereto by spring-strips, and a sleeve adjustably secured on said discharge-tube, substantially as set forth.

6. The combination, with a can having an opening for filling, a collar at its top, an inwardly and downwardly projecting flange on the collar, and an air-tube extending from the bottom to the top inside the collar, of a discharge-tube, a plug or stopper, spring-strips connecting the latter with the tube, and an adjustable sleeve mounted on the discharge-tube, substantially as set forth.

413,877. ANIMAL-TRAP. DAVID V. THRIFT, Nevada, Iowa. Filed July 17, 1889. Serial No. 317,773. (No model.)

Claim.—1. In a trap, a trigger formed of a single piece of wire bent upon itself and intermediate its ends to form a supporting-eye, and one of said ends terminating in a hook and the opposite end in a spring bait-retaining bar, substantially as specified.



2. The base 1 and the inverted-U-shaped bail 2, comprising opposite vertical arms, and bent at its center to form opposite depending loops 3, in combination with the cage 8, mounted upon the base and having diametrically and vertically opposite clips 14, adapted to embrace the arms 2, an opening formed in the top of the case and a cross-bar located thereover, and the herein-described trigger formed of a single piece of wire doubled and bent to form a foot and coiled to form opposite eyes 17 for the reception of the cross-bar, and having one terminal bent to form an eye 19, and a bait-arm 18, adapted to enter the eye, and the pivoted tongue formed of a single piece of wire bent upon itself and twisted and terminating in a foot engaging hook 7, and diverged at its opposite end to form eyes engaging the eyes and loops 3, substantially as specified

413,878. MUZZLE. EDWARD B. WEBBER, Collierville, Tenn. Filed June 25, 1889. Serial No. 315,536. (No model.)

Claim.—1. The improved muzzle, consisting of the wire frame A, the elliptical guide secured to the said frame, the wires I I, arranged parallel with the guides, the connecting-wires secured to and between the wires I I, the doors provided with eyes at their corners engaging

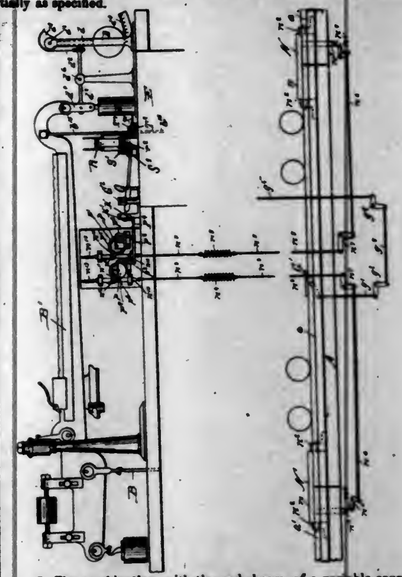
the guides, and the outwardly-projecting arms H on the doors, as set forth.

2. The improved muzzle consisting of the wire frame A, having the guides B and the gravity-doors C, sliding vertically on the guides independently of each other, and having the arms H, said doors being arranged at the front and rear of the wire frame and coming together in their normal position at the bottom of the frame, for the purpose set forth.

413,879. ELECTRIC TRAIN-SIGNAL. WILLIAM WINDER, Portsmouth, N. H. Filed Aug. 8, 1889. Serial No. 320,163. (No model.)

Claim.—1. The combination, for each of two like members of a coupling for an electric train-signal, of a metallic piece A, provided with a branch *a* to receive the split pin of the other member, and a branch *b*, having an insulated split pin B secured therein, two flexible electric cords which are insulated from each other, but which united in one cable are linked to a bracket E, adapted to be fastened to a car, one of said cords being electrically connected with said piece A and with one of two plates or studs *p*, adapted to be fastened to the car, and the other of said cords being electrically connected with the split pin and with the other of said plates or studs, substantially as and for the purposes set forth.

2. In combination with a car having a hood, a flexible electric cable composed of two cords insulated from each other, a metallic piece A, to form one member of an electric coupling, provided with a branch *a*, having an opening to receive a split pin attached to the other member of the coupling, and provided with a branch *b*, in which is secured an insulated split pin B, the cable being protected by a metallic covering F where it passes through an opening in the hood, and linked to a bracket E, fastened to the car, the cords of the cable being separated at each end, one of the cords being electrically connected with the split pin and with one of two insulated plates or studs *p* fastened to the car, and the other of said cords being electrically connected with the piece A and with the other of said plates or studs, substantially as and for the purposes set forth.



413,880. AUTOMATIC SCALE FOR WEIGHING RAILROAD-CARS AND RECORDING THE WEIGHT THEREOF. EDWARD H. AMET, Chicago, Ill., assignor to Herbert A. Streeter, same place. Filed Jan. 28, 1889. Serial No. 297,750. (No model.)

Claim.—1. The combination of a car-scale platform with levers N N′ at the end of the scale-platform, and spanning a portion of the scale-platform and a portion of the track outside of the platform, whereby one or the other of said levers may be operated by the front wheel of the car on the platform or by the front wheel of the succeeding car, according as the car is a long or short one, substantially as specified.

2. The combination of a car-scale platform with levers N N′ at the end of the scale-platform and spanning a portion of the scale-platform and a portion of the track outside of the platform, whereby one or the other of said levers may be operated by the front wheel of the car on the platform or by the front wheel of the succeeding car, according as the car is a long or short one, and a pair of ratchet or count wheels P P′, connected with and operated by said levers N N′, substantially as specified.

3. The combination, in an automatic car-scale, with a printing-wheel connected with and actuated by the scale, of an impression-lever, and a pair of car-wheel-operated levers N N′ at the ends of the scale-platform and spanning a portion of the scale-platform and a portion of the track outside of the platform, whereby one or the other of said levers may be operated by the front wheel of the car on the platform or by the front wheel of the succeeding car, according as the car is a long or short one, substantially as specified.

4. The combination of car-scale platform A with levers N N′, spanning a portion of said platform and of the track outside of the platform, ratchet or count wheels P P′, pawl K, impression-lever G, and type-wheel C, connected with and actuated by the scale, substantially as specified.

5. The combination, with the scale-beam, of a variable counterpoise consisting of a pendulum-balance and a printing-wheel connected with and operated by the movement of the scale-beam, substantially as specified.

6. The combination, in a car-scale for weighing cars in motion, of a scale-platform having track-rails thereon with a scale-beam and a dash-pot having a piston furnished with a yielding valve, so that the valve may open when the beam moves quickly, substantially as specified.

7. The combination, in a car-scale for weighing cars in motion, of a scale-platform having track-rails thereon with a scale-beam and a dash-pot having a piston furnished with two yielding valves, one opening up and the other down, substantially as specified.

8. The combination, with scale-beam B′, of a variable counterpoise, a type-wheel, and a dash-pot having a piston furnished with spring-valve, and a scale-platform having track-rails thereon, substantially as specified.

9. The combination, with scale-beam B′, of a variable counterpoise, a type-wheel, and a dash-pot having a piston furnished with two spring-closed ports, one opening up and the other down, and a scale-platform having track-rails thereon, substantially as specified.

10. The combination, with scale-beam B′, of type-wheel C and variable counterpoise D, consisting of a pendulum-balance having an arm *d*, furnished with an eccentric arc-shaped head d^2, and flexible band d^3, for connecting said pendulum-balance and said beam, substantially as specified.

11. The combination, with scale-beam B′, of type-wheel C and variable counterpoise D, consisting of a pendulum-balance having an arm *d*, furnished with an eccentric arc-shaped head d^2, and flexible band d^3, for connecting said pendulum-balance and said beam, and intermediate lever d^5, substantially as specified.

12. The combination, with scale-beam B′, of type-wheel C and variable counterpoise D, consisting of a pendulum-balance having an arm *d*, furnished with an eccentric arc-shaped head d^2, flexible band d^3, for connecting said pendulum-balance and said beam, and a dash-pot having piston connected with said beam, substantially as specified.

13. The combination, in an automatic-printing weighing-scale, with a scale-beam, of a type-wheel connected therewith, an impression lever or block and disk T, carrying a carbon-paper, substantially as specified.

14. The combination, in an automatic-printing weighing-scale, with a scale-beam, of a type-wheel connected therewith, an impression lever or block, and a carbon-paper-carrying disk T, and means for revolving said disk, substantially as specified.

15. The combination, in an automatic-printing weighing-scale, with a scale-beam, of a type-wheel connected therewith, an impression lever or block, and disk T, consisting of rubber and carrying a carbon-paper, substantially as specified.

16. The combination, in an automatic-printing weighing-scale, with a scale-beam, of the type-wheel connected therewith, and impression lever or block, and a movable elastic disk T, interposed between said impression-lever and type-wheels, substantially as specified.

17. The combination, with a scale-beam, of the type-wheel connected therewith, an impression lever or block, and a movable elastic disk T, interposed between said impression-lever and type-wheel, and a carbon-paper *t*, carried by said movable disk T, substantially as specified.

18. The combination, with a scale, of a variable counterpoise, a type-wheel C, rack-bar *b*, gears *c*′, dash-pot F and its piston F′, having a spring-closed port, and a scale-platform having track-rails thereon, substantially as specified.

19. The combination, with the scale-platform A, having track-rails *a* thereon, of the track *a*′, leading to the scale-platform, and the bail-shaped levers N N′, extending partly on the scale-platform and partly on the track, substantially as specified.

20. The combination, with an automatic-printing weighing-scale having a platform A, furnished with track-rails *a*, of the lever N, extending partly on the scale-platform and partly on the track beyond the scale-platform, substantially as specified.

21. The combination, with an automatic-printing weighing-scale having a platform A, furnished with track-rails *a*, of the lever N, extending partly on the scale-platform and partly on the track beyond the scale-platform, and a similar lever N′ at the other end of the scale-platform, substantially as specified.

22. The combination of the scale-platform A with a scale-beam, a variable counterpoise, a type-wheel, an impression lever or block, and the car-wheel-operated levers N N′, extending partly on the scale-platform and partly on the track leading thereto, substantially as specified.

23. The combination of the scale-platform A with a scale-beam, a variable counterpoise, a type-wheel, an impression lever or block, and the car-wheel-operated levers N N′, extending partly on the scale-platform and partly on the track leading thereto, a pawl K for holding said impression-lever raised, said car-wheel-operated levers N N′ operating to release said pawl, substantially as specified.

24. The combination of scale-platform A with a scale-beam, a variable counterpoise, a type-wheel, an impression lever or block, and the car-wheel-operated levers N N′, extending partly on the scale-platform and partly on the track leading thereto, a pawl K for holding said impression-levers raised, said car-wheel-operated levers N N′ operating to release said pawl, mechanism connecting said levers N N′ and pawl K, and provided with ratchet or count wheels, so that said pawl will only be operated after a certain number of impulses have been imparted to said levers N N′, substantially as specified.

25. The combination of the scale-platform A with platform and track lapping levers N N′, the scale-beam, the type-wheel, the impression-lever G, the pawl K, the ratchet-wheels P P′, the levers p^3 p^4, the connecting-link p^3, and the link p^4, substantially as specified.

26. The combination of the scale-platform A with the platform and track lapping levers N N′, the scale-beam, the type-wheel, the impression-lever G, the pawl K, the ratchet-wheels P P′, the levers p^3 p^4, the connecting-link p^3, the link p^4, and the cam-wheels p', substantially as specified.

27. The combination of the scale-platform A with the platform and track lapping levers N N′, the scale-beam, the type-wheel, the impression-lever G, the pawl K, the ratchet-wheels P P′, the levers p^3 p^4, the connecting-link p^3, the link p^4, the cam-wheels p', the slides n^{10}, and the pawls n^{11}, substantially as specified.

28. The combination of the slides n^{10}, having pawls n^{11}, the ratchet-wheels P P′, cam-wheels p', levers p^3, link p^3, pawl K, connected to said link p^3, impression-lever G, and type-wheel C, connected with and actuated by the scale, substantially as specified.

29. The combination of the slides n^{10}, having pawls n^{11}, the ratchet-wheels P P′, cam-wheels p', levers p^3, link p^3, pawl K, connected to said link p^3, impression-lever G, and type-wheel C, connected with and actuated by the scale, and levers N N′ on the scale-platform and connected with said slides n^{10}, substantially as specified.

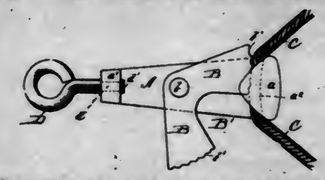
30. The combination of the slides n^{10}, having pawls n^{11}, the ratchet-wheels P P′, cam-wheels p', levers p^3, link p^3, pawl K, connected to said link p^3, impression-lever G, type-wheel C, connected with and actuated by the scale, levers N N′ on the scale-platform and connected with said slides n^{10}, lever G′ on the scale-platform, near the middle thereof, and connecting mechanism whereby the same operates to raise the impression-lever, substantially as specified.

31. The combination of the slides n^{10}, having pawls n^{11}, the ratchet-wheels P P′, cam-wheels p', levers p^3, link p^3, pawl K, connected to said link p^3, impression-lever G, type-wheel C, connected and actuated by the scale, levers N N′ on the scale-platform and connected with said slides n^{10}, lever G′ on the scale-platform, near the middle thereof, and connecting mechanism whereby the same operates to raise the impression-lever, and a pawl-lever regulating the feed of the paper and operated by said impression-lever, and the paper-strip-feeding guiding spools and pulleys, substantially as specified.

32. The combination, with a scale-platform, of the levers N N′ and G thereon, ratchet or count wheels P P′, pawl K, impression-lever G, and mechanism, substantially as described, connecting said parts, substantially as specified.

33. In an automatic car-scale, the combination, with a scale-platform having track-rails thereon, of a device at each end of the scale-platform adjacent to the track-rail adapted to be operated by the passage of the car-wheels, and an impression-lever connected and operated by one or the other of said car-wheel-actuated levers, according as the car is a long or a short one, substantially as specified.

413,881. FIRE-ESCAPE. EDWARD H. AMET, Chicago, Ill., assignor to himself and Herbert A. Streeter, same place. Filed Mar. 11, 1889. Serial No. 302,855. (No model.)



Claim.—1. The combination, in a stand-pipe fire-escape, of the stand-pipe with a hollow side bar communicating therewith and hollow rungs communicating with said hollow side bar and a valve, said rungs having no communication with the stand-pipe except through said valve and hollow side bar, so that the admission of water to said rungs may be controlled by said valve, substantially as specified.

2. The combination, in a stand-pipe fire-escape, of the stand-pipe with hollow side bar communicating therewith and hollow rungs communicating with said hollow side bar, said hollow rungs being provided with spraying-perforations, substantially as set forth.

3. The combination, with the stand-pipe A, of hollow side bar C, communicating therewith, fire-escape platform H, and perforated spraying-arm G, substantially as set forth.

4. The combination, with the stand-pipe A, of hollow side bar C, communicating therewith, fire-escape platform H, perforated spraying-arm G, and valve E, said side bar C having no communication with said stand-pipe except through said valve, substantially as specified.

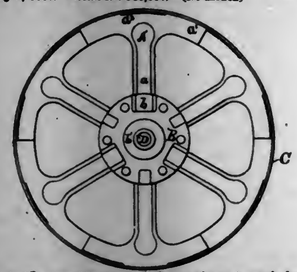
413,882. DEVICE FOR HOLDING CORDS OR LINES. EDWARD H. AMET, Chicago, Ill., assignor to himself and Herbert A. Streeter, same place. Filed Mar. 11, 1889. Serial No. 302,856. (No model.)

Claim.—The combination, in a line or rope holder, of clamp-bar A, having hook *a*, with double-wing eccentric clamping-pawl B B, piv-

oted to said bar A, and swivel-ring D, having shank *d* extending through a projection *a'*, with which said bar A is provided, substantially as specified.

413,883. BROOM-CORN-COMBING MACHINE. ABRAHAM ANDERSON, Galesburg, Ill., assignor to G. D. Colton & Company, same place. Filed Sept. 26, 1885. Serial No. 178,410. (No model.)

Claim.—1. In a broom-corn comber, a spiked belt for conveying the straw, in combination with a toothed wheel revolving at the side of said belt and in the same direction, and a fixed guide for holding the brush in place.



2. In a broom-corn comber, revolving pulleys, horizontal feed-belts running upon the same, and a spiked belt for conveying the straw running between said belts, in combination with a toothed wheel revolving at the side of said belt and in the same direction, and a fixed guide for holding the brush in place.

3. In a broom-corn-combing machine, the combination of the combing-cylinders arranged obliquely to the line of feed, a spiked belt for conveying the straw, a toothed wheel revolving at the side of said belt, and a fixed guide for holding the brush in place.

4. In a broom-corn-combing machine, the combination of the combing-cylinders arranged obliquely to the feed, a spiked belt for conveying the straw, a toothed wheel revolving at the side of the belt, a fixed guide for holding the brush in place, and the feed-belt I².

5. In a broom-corn-combing machine, the combination of the combing-cylinders, the spiked belt for conveying the straw, a toothed wheel revolving at the side of the belt, a fixed guide for holding the brush in place, and the doffer-bars N', carved around the feed-belt to disengage the brush from the latter.

413,884. METALLIC WHEEL. HENRY W. AVERY, Cleveland, Ohio. Filed May 9, 1889. Serial No. 310,097. (No model.)

Claim.—1. The combination of the sections A, each having a spoke *a*, a rim *a'*, and a turned-over flange a^3, with two hub-pieces having radial sockets which receive the ends of said spokes, substantially as and for the purpose specified.

2. The combination of the section A, each having a spoke *a*, a rim *a'*, and a flange a^3, bent to both sides of the rim, with two hub-pieces having radial sockets which receive the ends of the spokes, substantially as and for the purpose specified.

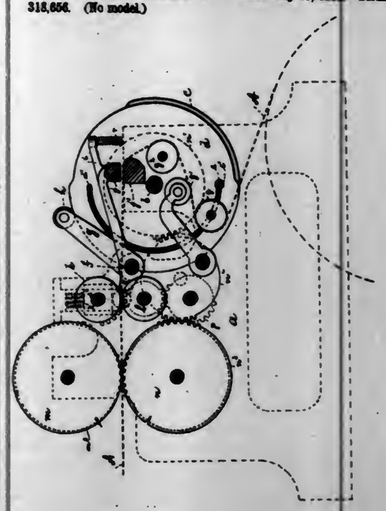
3. The combination of a sheet-metal wheel having a turned-over annular flange with a tire, said tire and flange being connected by bending one part into holes in the other part, substantially as and for the purpose specified.

413,885. RETORT-VAPORIZER. COUTLAND HALL, Indianapolis, Ind. Filed May 13, 1889. Serial No. 310,673. (No model.)

Claim.—1. In apparatus for vaporizing and burning hydrocarbon oils, in combination with the gas-chamber C, having the burners constructed as described, the vaporizing-retort A, arranged a short distance above the gas-chamber and provided with flues H H for conducting the flame and heat from the burners upward, with pipes for supplying oil and water thereto, and with interior alternating partitions for prolonging the passage of vapor to its exit, the superheating-retort B, of similar construction to the retort A, arranged above said retort A and connected thereto by the pipe E for conducting the vapor to the superheater, and connected with the gas-chamber by the pipe S, opposite pipe E, for conducting the gas to the gas-chamber and burners, substantially as and for the purpose specified.

2. In apparatus for vaporizing and burning hydrocarbon oils, the vapor-generating retort A, provided with square flues H and partition-walls *a a'*, and divided into vapor-generating cells *a c c² c³ c⁴*, formed by the walls of flues H and the partitions, a retort B, of similar construction to retort A, situated a short distance directly above it and connected to it by a pipe E, through which the vapor from retort A may pass into retort B, wherein the vapor is decomposed and converted into gas, and a burner located below retort A, and connected to said decomposing-retort B by pipe S, substantially as set forth.

3. In apparatus for vaporizing and burning hydrocarbon oils, in combination with a gas-chamber provided with burners for consuming gas, a vapor-generating retort and a vapor-decomposing retort of similar construction arranged a short distance apart, the former directly above the burners and the latter directly above the former, provided with alternating partitions, thus forming a series of cells within them and connected together by a pipe through which the vapor may pass to the decomposing-cells, the former retort connected with the supply-pipe opposite its exit and provided with flues for conducting the flame and heat to the decomposing-retort from the burners, and the latter retort connected by a pipe opposite its supply-inlet to the gas-chamber for supplying gas to the burners, substantially as set forth.



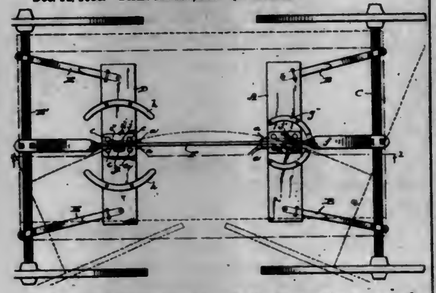
413,886. YEAST-CAKE. JOSHUA BARBER, Brooklyn, N. Y. Filed July 7, 1888. Serial No. 279,312. (No specimens.)

Claim.—1. As an article of manufacture, a yeast-cake having a coating or envelope of sugary matter, as set forth.

2. As an article of manufacture, a yeast-cake having a hermetically-sealing envelope of sugary matter, as specified.

3. As an article of manufacture, a yeast cake having its particles sealed and protected from the deleterious effects of the atmosphere by a coating of sugar and gum or equivalent material, as and for the purpose set forth.

413,887. CUTTING ATTACHMENT FOR PRINTING-PRESSES. AUGUST R. BARTLAU, Plainfield, N. J. Filed July 25, 1888. Serial No. 318,656. (No model.)

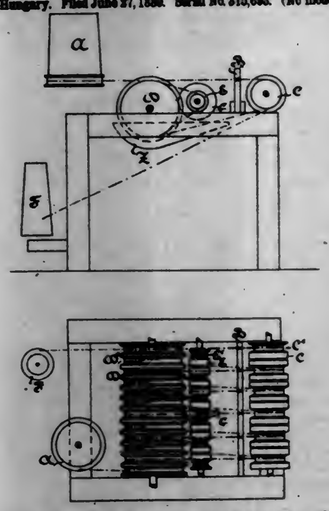


Claim.—1. The combination of a pair of adjustable cams with a shaft *f*, carrying arms *g i*, the arm *g*, having roller *h*, that engages the cams, and the arms *i*, having stop *j'*, and with the block *j'*, substantially as specified.

2. The combination of a pair of adjustable cams with shaft *f*, arm *g*, and roller *h*, engaging the joint surfaces of the cams, and with the arms *i*, having extensions *i'*, the arms *i*, carrying stop *j'*, and the extensions *i'*, engaging the adjustable bearings of a feeding-roller, and with the block *j'*, substantially as and for the purpose specified.

3. The combination, in a cutting attachment for printing-presses, of the following elements: a pair of cams, a roller engaging the cams, a pair of arms connected to the roller-carrying shaft, a stop and a feed mechanism operated by the arms, and a pair of cutting-cylinders, substantially as and for the purpose described.

413,888. WAGON-GEAR. CHARLES S. BEERS, Racine, Wis. Filed Dec. 11, 1888. Serial No. 293,310. (No model.)



Claim.—1. The combination, with the front and rear gear of a wagon, of an elastic reach and pivotal connections between the front gear and the body, and pivotal and sliding connections between the rear gear and the body.

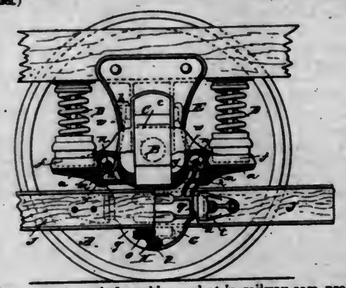
2. The combination, with the front and rear axles of a wagon, of an elastic reach and front and rear pivotal connections between the said axles, substantially as set forth.

3. The combination, with a wagon-body and its front and rear gear, of an elastic reach having pivotal connections with each gear, whereby the said body may be moved sidewise both in front and rear equally.

413,889. WIRE-DRAWING MACHINE. BLASIUS BRODE, Feistritz, Austria-Hungary. Filed June 27, 1889. Serial No. 315,693. (No model.)

Claim.—1. In a wire-drawing machine, the combination, with a revolvable drawing-cylinder, of a series of guide-rollers journaled on a shaft, a series of dies for gradually reducing the wire arranged between the said rollers and the cylinder, and a series of intermediate guide-rollers journaled between said dies and the cylinder for the wire to pass around, substantially as set forth.

2. In a wire-drawing machine, the combination, with a revolvable drawing-cylinder provided with a series of circumferential projecting ribs for separating the loops of the wire, of a series of guide-rollers journaled on a shaft, a series of dies arranged between the said rollers and the cylinder, and a series of intermediate guide-rollers journaled between said dies and the cylinder for the wire to pass around, substantially as set forth.



3. In a wire-drawing machine, the combination, with a revolvable conical drawing-cylinder provided with a series of circumferential projecting ribs for separating the loops of the wire, of a series of guide-rollers journaled on the shaft, a series of dies arranged between the said rollers and the cylinder, and a series of intermediate guide-rollers journaled between said dies and the cylinder parallel with the surface of said cylinder for the wire to pass around, substantially as set forth.

4. In a wire-drawing machine, the combination, with a revolvable drawing-cylinder, of a series of guide-rollers journaled on a shaft at a short distance from said cylinder, and one or more rollers of greater diameter than said guide-rollers journaled on the said guide-roller shaft and bearing against the surface of the cylinder for relieving the shaft from bending strain, substantially as set forth.

5. In a wire-drawing machine, the combination, with a revolvable drawing-cylinder, of a longitudinally-reciprocating shaft and a series of guide-rollers for the wire to pass around, journaled on said shaft and partaking of its reciprocating motion, substantially as and for the purpose set forth.

6. In a wire-drawing machine, the combination, with a revolvable drawing-cylinder, of a shaft parallel with the surface of said cylinder, a series of grooved guide-rollers journaled on said shaft, and a cam and a spring for imparting a longitudinal reciprocating motion to said shaft and guide-rollers, substantially as and for the purpose set forth.

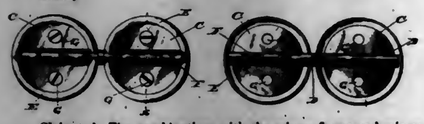
413,890. TRUCK FOR CABLE OR ELECTRIC CARS. SUMNER A. BEMIS, Springfield, Mass. Filed Sept. 2, 1889. Serial No. 322,779. (No model.)

Claim.—1. A truck for cable or electric railway cars, provided with a suitable horizontal support pivotally mounted for a swiveling motion in a vertical plane, and one or more rests located and supported laterally beyond said horizontal support, combined with a grip or other supporting-beam adapted to be maintained on said horizontal support and projected forwardly and rearwardly therefrom and provided forwardly or to the rear of said rest or rests with bearing-abutments, substantially as and for the purpose described.

2. A truck for cable or electric railway cars, provided, first, with a suitable horizontal support pivotally mounted for a swiveling motion in a vertical plane and having on its upper side a cushion, and, secondly, with one or more rests located and supported laterally beyond said horizontal support, combined with a grip or other supporting-beam adapted to be maintained on said horizontal support and projected forwardly and rearwardly therefrom, and provided forwardly and to the rear of said rest or rests with bearing-abutments, substantially as described.

3. The combination, in a truck for cable and electric railway cars, with the hollow step-extensions *a a*, of the beam-support consisting of the opposing cheek-pieces supported from said step-extensions, and provided, first, with the horizontal supporting-block H, pivotally supported therein and having the cushion *o*, and, secondly, with the laterally-extended rest *q*, and the carrying-beam adapted to be passed between said cheek-pieces, resting on said cushioned block and extending forwardly and rearwardly therefrom, and provided forwardly and to the rear of said rest or rests with cushioned bearing-abutments, substantially as and for the purpose described.

4. In cable or electric railway car trucks, a carrying-beam support consisting of separated and opposing cheek-pieces, each having extending between their lower portions a removable beam-supporting



block, and having extending laterally from the outer side of one or both of said cheek-pieces one or more rests *q*, substantially as and for the purpose set forth.

5. In cable or electric railway car trucks, a carrying-beam support consisting of separated and opposing cheek-pieces having at their upper portions the extensions *m m'*, through which supporting-bolts therefor may be passed, and provided with the uniting cross bracing *k*, and provided between their lower portions with the cushioned block H and the removable supporting-bolt *p*, and also having extending laterally from the outer side of one or both of said cheek-pieces one or more rests *q*, substantially as described.

6. In a truck, the combination, with the car-body having the pedestal thereon, of the journal-box steps provided with the transverse bolts *n*, and the rods *w*, by their upper portions secured to said pedestals and having their lower ends hooked and adapted to engage with said bolts *n*, substantially as and for the purpose described.

7. In a truck, the combination, with the car-body having the pedestal thereon, of the hollow journal-box steps provided with the transverse bolts *n*, the beam-support G, pending from said bolts, and the rods *w*, by their upper portions secured to said pedestals and having their lower ends hooked and adapted to engage with said bolts, substantially as and for the purpose described.

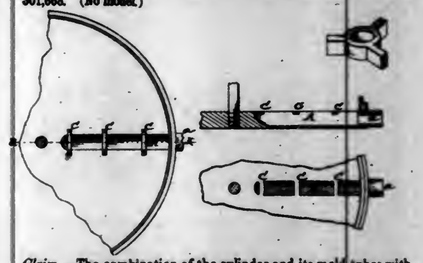
413,891. FRICTION-HINGE. Julius Berkey, Grand Rapids, Mich. Filed Nov. 28, 1888. Renewed Sept. 30, 1889. Serial No. 325,468. (No model.)

Claim.—1. The combination, with the mirror-frame and mirror-supports, of a pintle and two slightly-separated superposed plates provided with registering grooves adapted to receive the end of the pintle, whereby a uniform frictional bearing is formed for nearly the entire surface of the end of the pintle, and means for clamping the plates upon the pintle, whereby rotation upon the pintle may be resisted by any desired friction.

2. The combination, with a hinge-pintle, of two plates provided with diametrical registering grooves for the pintle and having an annular groove which serves as a stiffening-rib and a keeper for the pintle.

3. The combination, with the plates C, arranged in pairs, provided with registering screw-holes G and each having the marginal groove E and the diametrical groove F, of the pintle-rod D, lying between the plates in the groove F, substantially as and for the purpose set forth.

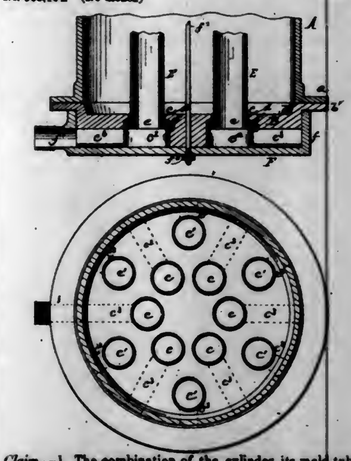
413,892. COMBINED BOTTLE AND CORK-CAP. Paul C. Birrbach, Milwaukee, Wis. Filed July 1, 1889. Serial No. 316,222. (No model.)



Claim.—1. A bottle exteriorly provided with a spiral ridge contracted at the upper end of the bottle to form a thread and a screw-cap engaged by the thread, substantially as set forth.

2. A bottle having a screw-threaded neck and a cap for engagement with said neck cut away to leave a central opening and diametrically-opposed tongues, the latter being bent up to form lugs, substantially as set forth.

3. A bottle having a screw-threaded neck and a cap for engagement with said neck cut away to leave a central opening and diametrically-opposed tongues, the latter being bent up and over to form open lugs, substantially as set forth.

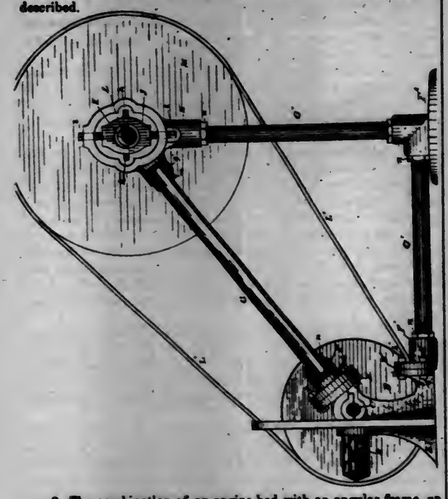


4. A bottle having an exterior spiral ridge contracted at the upper end of the bottle to form a thread and a screw-cap having the top thereof cut away to leave a central opening and diametrically-opposed tongues, the latter being bent up and over to form open lugs, substantially as set forth.

413,893. APPARATUS FOR MAKING PRINTERS' ROLLERS. Leander K. Bingham, New York, N. Y. Filed Mar. 1, 1889. Serial No. 301,668. (No model.)

Claim.—The combination of the cylinder and its mold-tubes with a bottom having a gutter across which there are several bridges in the paths of the mold-tubes, as set forth.

413,894. APPARATUS FOR MAKING PRINTERS' ROLLERS. Leander K. Bingham, New York, N. Y. Filed Mar. 13, 1889. Serial No. 303,104. (No model.)



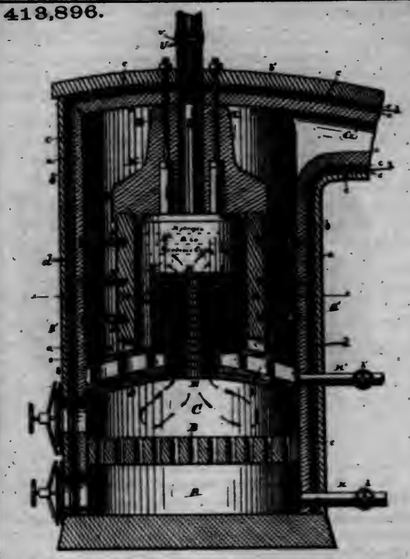
Claim.—1. The combination of the cylinder, its mold-tubes, the bottom head having the holes for the tubes, the countersinks around the holes, and the bottomless channels running from the countersinks to the edge of the head with the bottom provided with the nozzle, as set forth.

2. The combination of the cylinder, its mold-tubes, the bottom head having the holes for the tubes, and the bottomless channels running from the holes to the edge of the head with the bottom provided with the nozzle, as set forth.

413,895. ENGINE AND SHAFTING BED. Virgil W. Blanchard, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Mar. 29, 1889. Serial No. 305,297. (No model.)

Claim.—1. The combination, with an engine-bed and a belt-wheel on the main or crank shaft of an engine, of a frame which is rigidly secured to said bed and provided with a head in which is adjustably mounted a journal-box for the journal of a line-shaft, substantially as described.

2. The combination of an engine-bed with an angular frame, an adjustable head thereon, and an adjustable gimbal mounted in said head and carrying an adjustable journal-box for a line-shaft, substantially as described.



3. The combination of an open head H, a vertically and horizontally adjustable journal-box, a line-shaft bearing a belt-wheel, and a frame supporting the same secured rigidly to an engine-bed bearing a crank-shaft, and a belt-wheel on this shaft, substantially as described.

4. A supporting-frame for a line-shaft, consisting of the sections G G' G'', secured by means of right and left screw-threads into an open head H, to a base-coupling F', and to ferrules which are bolted to an engine-bed, substantially as described.

5. In combination with an engine-bed, a triangular support for a line-shaft secured to said bed and having the section G, connected by pivots P to the parts F H, substantially as described.

6. In an engine-bed and shaft-support, the combination of the bed A, having circular heads E E', and the head H, with the sections G G' G'' and ferrule F, all substantially as specified.

413,896. FURNACE. Virgil W. Blanchard, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Mar. 29, 1889. Serial No. 305,300. (No model.)

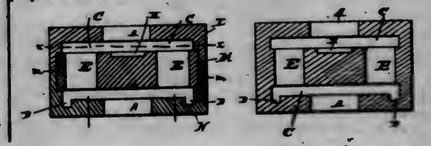
Claim.—1. In a furnace, the double-wall magazine or tube E, having both of its walls perforated horizontally, in combination with an air-supply pipe, a fuel-chamber, a mixing-chamber above said tube, and a narrow vertical passage leading from the latter to an exterior mixing-chamber G, all constructed and adapted to operate substantially as described.

2. In a furnace, the combination, with a fire-chamber, of a hollow dome above the same, having an interior air-channel, a tube rising from said dome and having double walls, each laterally perforated, the space between the walls of said tube communicating with the air-passage in said dome, the mixing-chamber above said tube, the descending flue exterior thereto, and the exterior gas-mixing chamber communicating at bottom with said flue, substantially as described.

3. In a furnace, the combination of a central double-wall magazine, both of the walls of which are perforated, a double-walled dome having an air-channel communicating with the space between the walls of the magazine, means for supplying air thereto under pressure, a mixing-chamber F, passages *j i*, and a mixing-chamber G, having perforated rings is it, substantially as described.

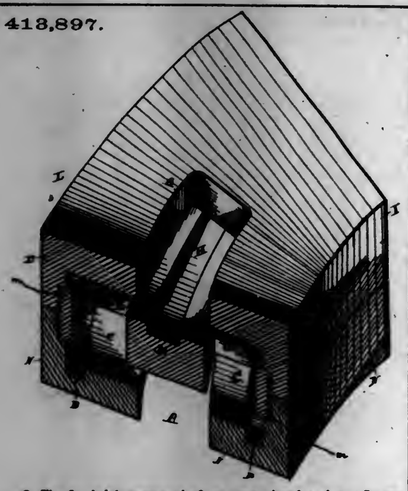
4. In a furnace, the combination of the fuel-chamber C, the hollow dome D, open at top, the double-walled tube having each wall perforated, the mixing-chamber F, descending flues exterior to said tube, and the exterior chamber G, and annular perforated rings therein; all constructed and arranged to operate substantially as and for the purpose described.

5. In a furnace, the combination, with a fire-box, of a dome D, a double-walled tube having each wall perforated, an annular wall W exterior thereto, and a cap closing the top of said wall, all substantially as and for the purpose specified.



6. A furnace consisting of an exterior casing, a fire-chamber therein, a hollow dome D, the double-walled tube having each wall perforated, the wall W exterior to said tube, the cap K, and annular perforated rings J J, all substantially as described.

7. In a furnace, the combination of the fuel-chamber C, having a grate, a hollow dome D, tube E, having double laterally-perforated walls, mixing-chamber F above said tube, the descending flues inside the same, the air-supply passages and jets in said dome and tube, and the mixing-chamber G exterior to said tube and chamber F and separated therefrom by a fire-brick wall, all constructed and arranged to operate substantially as and for the purpose described.



413,897. BRICK FOR FURNACES. Virgil W. Blanchard, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Mar. 29, 1889. Serial No. 305,302. (No model.)

Claim.—1. A fire-brick composed of an upper chambered part provided with a central flue, a lower chambered part provided with a central flue, and an intermediate partition having flues E E, all substantially as specified.

2. A hollow or chambered brick having the upper and lower horizontal passages C C, the interior partition having flues E E and trap H, and the vertical passages A A, all substantially as and for the purpose described.

413,897.

3. The fire-brick composed of an upper chambered part L, provided with a central flue, a lower chambered part N, formed with a central vertical flue and cinder-traps, and a partition M, interposed between parts L and N and having flues E E and trap H, all substantially as described.

413,898. GRATE FOR FURNACES. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 4, 1889. Serial No. 305,968. (No model.)

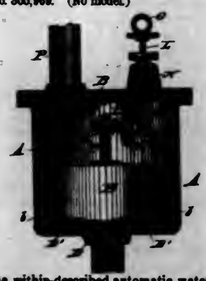
Claim.—1. The combination, in a grate, of stationary bars with intermediate rocking bars having crushing-heads provided with a series of air-passages, for the purpose and substantially as described.

2. In a grate, the combination of stationary bars having double beveled heads with a series of intermediate rocking bars having double beveled heads formed with air-passages, whereby air is admitted through the bars, substantially as and for the purpose specified.

3. In a grate constructed with movable bars, the combination therewith of longitudinally-grooved stationary bars having double beveled and grooved heads and longitudinally grooved on their under surfaces, substantially as described.

4. The movable hammer-headed bars composed of sections locked together and provided with air-jet passages, as described, in combination with the stationary bars, as specified.

5. The combination, with a series of stationary bars, of a series of rocking bars parallel with and between the stationary bars, said rocking bars being composed of sections fitted together by tongue-and-socket joints and provided with coincident grooves forming air-passages, substantially as described.



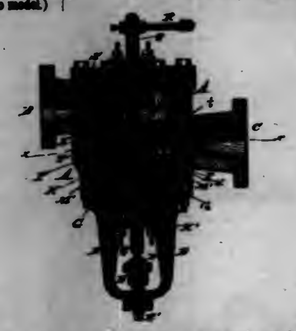
6. The combination of a series of stationary bars having double inclined and grooved upper edges with a series of rocking bars alternating with said stationary bars and having enlarged and perforated heads and depending shanks, and the uniting-links between said rocking bars for operating them simultaneously, substantially as set forth.

7. The combination, with the stationary bars, of intermediate rocking bars composed of sections fitted together upon a supporting-rod, and having enlarged heads channeled on their meeting edges, and depending shanks, the rods passing through said shanks, and the links connecting said rods for operating the rocking bars, substantially as specified.

8. The combination of the grate-bars having inclined upper edges and longitudinally channeled or grooved, with a series of rocking bars composed of similar sections having enlarged heads grooved on their meeting faces, and tongues and sockets for locking the adjoining sections together, and the links and rods for rocking said bars, substantially as described.

9. The herein-described grate, composed of a series of stationary bars having a longitudinal channel at bottom and their upper edges beveled and grooved, with a series of rocking bars composed of similar sections fitted on a suspending-rod, each section having an enlarged double beveled head channeled on its sides, and a tongue and socket on its depending portion or shank, and a laterally-perforated eye, and the rods passing through said eyes, the links connecting said rods, and the operating-rod for rocking the bars, all substantially as and for the purpose specified.

413,899. LOW-WATER ALARM. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 4, 1889. Serial No. 305,969. (No model.)



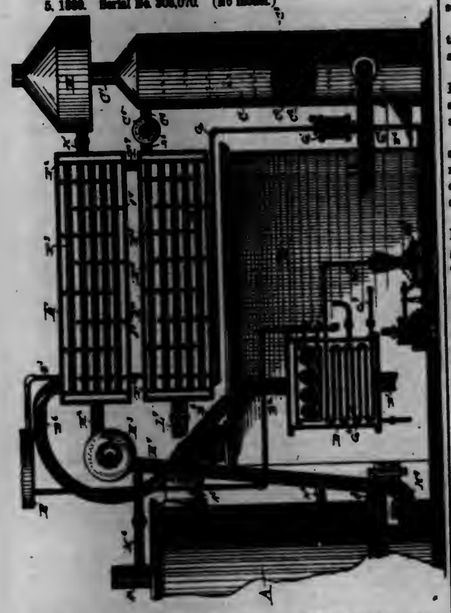
Claim.—1. The within-described automatic water-alarm, consisting of a vessel having inlet and outlet passages, a hollow float having a collared stem, a pivoted latching-dog above said float engaging said stem, and a rod playing through a stuffing-box above the float and provided with a disk on its lower end engaging said dog, and means for connecting the rod with an alarm, all substantially as specified.

2. The within-described automatic water-alarm, consisting of a vessel A, having inlet and outlet passages, a hollow float having a vertical stem provided with a collar, a latching-dog pivoted above the float, and a spring-actuated rod playing through a stuffing-box and provided with a disk on its lower end, and means for connecting the rod with an alarm, all constructed and adapted to operate substantially in the manner set forth.

3. The combination of the vessel A, the float E therein, having a stem F, and the dog H, engaging said stem and having a catch K, and pivoted to lugs depending from the top of said vessel, with the vertically-movable rod L, engaging said catch and passing through the top of said vessel, and means for connecting the rod with an alarm, all substantially as set forth.

4. The combination of the vessel A, having inlet and outlet passages and studs D', and the rod L, having disk L' and spring M, and means for connecting the rod with an alarm, with the pivoted dog K, the float E, and its collared stem F, all substantially as and for the purpose specified.

413,900. STEAM-VALVE. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 4, 1889. Serial No. 305,970. (No model.)



Claim.—1. The combination of the valve-casing having an internal annular channel, and the annular flanges below and above said channel, an inlet-port above said flange, and an outlet-port from said channel, with a cup-shaped valve-seat H, constructed substantially as described, supported on said flanges and slitted substantially as described, and a cup-shaped slitted valve fitted in said seat, and the adjustable valve-stem carrying said valve, all substantially as specified.

2. The combination of the valve-casing and the cup-shaped slitted valve-seat therein with the cup-shaped slitted valve M, fitted in said seat and having strengthening-ribs p' p', and the valve-stem, all substantially as and for the purpose specified.

3. The combination of the valve-casing having channel T and annular flanges and inlet and outlet ports, substantially as described, the conical slitted valve-seat H, fitted in said casing, and the conical slitted valve M, fitted to said seat and having openings M' in its bottom, with the valve-stem Q, carrying said valve, the stuffing-boxes therefor, and the bracket D and adjustable oil-cup F, all constructed and arranged to operate as specified.

413,901. GAS-COOLER FOR FURNACES. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 5, 1889. Serial No. 306,070. (No model.)

Claim.—1. The combination of a steam-boiler furnace with a steam-condensing vessel and means, substantially as described, for withdrawing gases from the chimney and returning them through said vessel to the furnace, substantially as set forth.

2. The combination, in a steam-boiler furnace, of a gas-collecting trap, a steam-condenser, and means, substantially as described, for withdrawing the gases from the trap and directing them through said condenser to the furnace, for the purpose specified.

3. The combination, in a steam-boiler furnace, of an air-heater in the uptake and a steam-condenser with means, substantially as described, for directing a current of air through said condenser into the air-heater, and from thence to the furnace, as specified.

4. The combination, in a steam-boiler furnace, of a steam-condenser with means, substantially as described, for withdrawing gases from the chimney and directing them through a part of said condenser to the furnace, and means for directing a current of air through the other portion of the condenser to the furnace, all substantially as specified.

5. The combination of the steam-condenser and water-heater with the exhaust-steam pipe leading to said heater, the pipes connecting said heater and condenser, the pump communicating with said condenser and with a coil in said heater, and the connection between said coil and boiler, all constructed as and for the purpose set forth.

6. In a steam-boiler furnace, the combination of the air-heater and gas-trap communicating with the chimney with the steam-condensing vessels and the connections between the said vessels and the gas-trap and air-heater, respectively, all substantially as specified.

7. The combination, in a steam-boiler furnace, of a steam-condenser and a gas-trap communicating with the chimney with the air-forcing engine and pipes, whereby the gases are withdrawn from the trap and through the condenser and directed into the furnace, all as and for the purpose described.

8. The combination of the furnace and the air-heater located in the chimney, and the steam-condenser, with the air-forcing engine, the pipes connecting the condenser with the air-heater and the heater with the furnace, as and for the purpose specified.

9. The combination, in a steam-boiler furnace, of the gas-trap and air-heater connected to the chimney and the steam-condensing vessels communicating with the exhaust of an engine with the air engines and pipes connecting said vessels respectively with the gas-trap and air-heater and with the furnace, whereby gases and air may be drawn through said vessels and carried to the furnace, substantially as described.

10. The combination, with the water heater and purifier D and the condensing-vessel E, of the air-heater C, the pipes connecting the condenser and heater, the alarm, and the air engine and pump, all substantially as set forth.

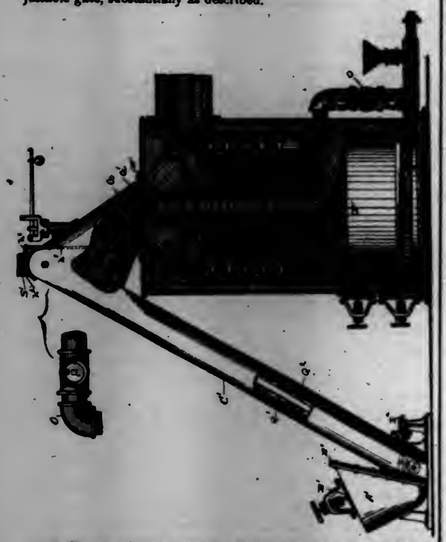
11. The combination of the condenser F F', the air-heater C, and the furnace and pipe connections between said condenser and furnace and the air-engines, all substantially as and for the purpose specified.

12. The combination, in a steam-boiler furnace, of the condenser F F', the water heater and purifier D, and the connections between said heater and purifier with the air-heater C and gas-trap H, all as and for the purpose described.

13. The combination, with the steam-condenser and air-heater, substantially as described, provided with an air-inlet pipe having a regulating-valve, with an air-forcing engine connected to said condenser, whereby the air may be attenuated in its passage therethrough, substantially as and for the purpose specified.

14. The combination, in a steam-boiler and furnace, of the vessels F F', connected and constructed substantially as described, with the gas-trap H, the air-heater C, the air-forcing engines, water-pump, and cold-water condenser, all substantially as specified.

15. The combination, in a steam-boiler furnace, of the water heater and condenser D, the steam-condensing vessels F F', and the cold-water condenser E with the gas-trap G, air-heater C, alarm, and the air and water pumps, all constructed and arranged to operate substantially as specified.



413,902. FUEL-FEEDER FOR FURNACES. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 5, 1889. Serial No. 306,071. (No model.)

Claim.—1. In combination with a furnace and an endless-chain fuel-elevator, substantially as described, a valve adapted to receive the fuel from the buckets and deliver it into the furnace, and the mechanism, substantially as described, whereby said valve is automatically opened and closed by the buckets, as and for the purpose set forth.

2. The combination, with the furnace, the automatically-operated valve G', and the endless-chain fuel-elevator and its casing, of the air-supply pipe for said casing and the devices for automatically regulating the admission of air into the casing at the moment valve G' is operated, all substantially as specified.

3. The combination, with the elevator-casing, its endless chain and buckets, and the tracks therefor, of the tracks or ways for the trucks, substantially as specified.

4. The combination of the elevator-casing, its endless chain and buckets, and the receptacle A^0 with the agitator-wheel and the adjustable gate, substantially as described.

5. The combination, with the fuel-elevating buckets, of the adjustable bottoms, constructed and arranged substantially as specified.

6. The combination of the furnace, the feed-valve G', and the elevator-casing and elevator chain and buckets therein with the tripping-levers and connections thereof to said valve and the mechanism for operating said chain, all substantially as specified.

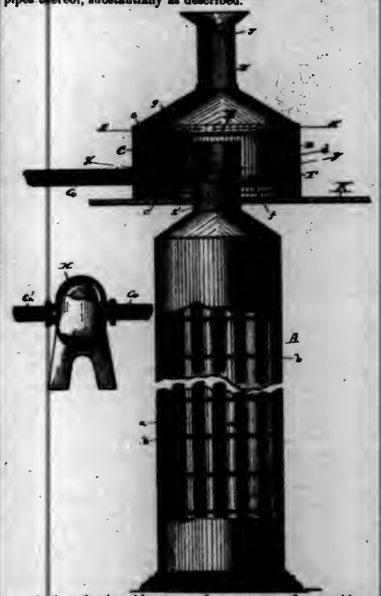
7. The combination, with the furnace and the elevator casing and chain and buckets, of the worm-gearing and shafting for operating said chain, and the pulleys and clutch and governor for automatically operating said shafts, all substantially as specified.

8. The herein-described elevator-buckets Q', having legs U' and adjustable bottoms S^3, substantially as and for the purpose set forth.

9. The combination of the valve G' and the tripping-levers H' and I', connected to said valve, with an endless-chain elevator and the buckets thereon adapted to operate said levers, all substantially as set forth.

10. The combination of the valve G' and the tripping-levers H' and I', connected thereto, with the endless-chain elevator and its buckets adapted to operate said levers, and the valve X^2 and the connections between the same and lever H', all substantially as set forth.

11. The combination, with the furnace, the casing C', and fuel-receptacle A^3, and the agitator-wheel W', elevator-chain Q^2, and its buckets, of the shaft Z^3 and its connections for operating said chain, the cone-pulleys Z' and Y', shaft a^2, and clutch c', connected to a steam-governor, all substantially in the manner and for the purpose set forth.



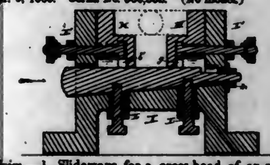
12. The combination, with the furnace, the air-tight casing C', the fuel-elevator chain and buckets therein, and the air-supply pipe S', and the devices, substantially as described, for automatically controlling the operation of said chain, of the valve G', levers H' I', rods H^3 I^3, and arms A A and rod, all constructed substantially in the manner and for the purpose specified.

413,903. GAS-TRAP FOR CHIMNEYS. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 6, 1888. Serial No. 306,208. (No model.)

Claim.—1. The combination, with the escape-flue of a furnace, of a gas-trap having a receiving-chamber communicating with the flue closed at top and bottom, but open at its sides near the bottom, a gas-arresting chamber communicating with the receiving-chamber and with the outlet to the chimney, and a pipe leading from the bottom of said chamber to an exhaust and forcing engine, substantially as and for the purposes specified.

2. A carbonic-acid-gas trap for the escape-flue of a furnace, consisting of a hood, a receiving-chamber having a closed bottom, and an annular arresting-chamber outside the receiving-chamber, and a pipe leading from said arresting-chamber to an exhausting and forcing engine, substantially as described.

3. In a gas-trap constructed substantially as described, the pipe-coil having perforations in its lower side and located in the annular space d, in combination with an exhausting and forcing engine and the pipes thereof, substantially as described.



4. A carbonic-acid-gas trap for an escape flue or chimney, consisting of the following elements: a cylindro-conical hood, a contracted outlet therefor, an internal cylinder forming spaces d g, outlets f therefor, the perforations e, leading out of the space d, and a perforated pipe-coil communicating with a blower, all constructed and adapted to operate substantially as described.

5. The combination, with the escape-flue of a furnace, of a device having a horizontal downwardly-deflecting diaphragm, a chamber outside and below the same, outlets below the same, a suction-pipe leading from said chamber, and an exhausting-engine, substantially as and for the purposes described.

6. The combination, with a gas-trap and an escape-flue, of a perforated pipe lying in the bottom of said trap, and an exhausting-engine, substantially as and for the purposes described.

413,904. SLIDEWAY FOR CROSS-HEADS. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 9, 1889. Serial No. 306,532. (No model.)

Claim.—1. Slideways for a cross-head of an engine, which are adjustable vertically and horizontally, substantially as described.

2. The combination of the frame, the vertically and horizontally adjustable slideways, and the screw-bolts, jam-nuts, and endwise-adjustable gibs, substantially as described.

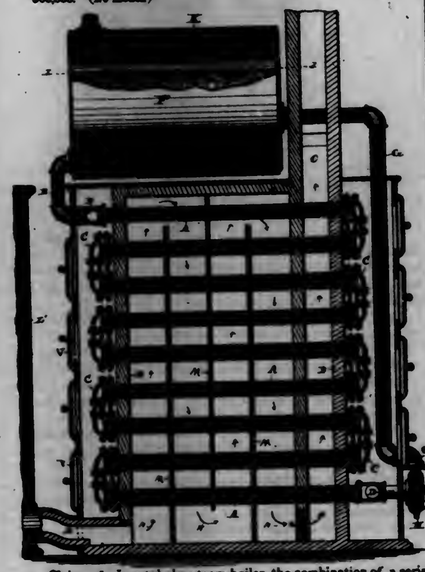
3. The combination of vertically and horizontally adjustable slideways, the supporting-frame, screw-bolts tapped through the cheeks of said frame, adjustable gibs, and lock-nuts, substantially as described.

4. In combination with slideways which are vertically and transversely adjustable, means, substantially as described, for adjusting and locking said slideways, for the purpose specified.

5. In the combination of the recessed slideways with laterally-adjustable screw-bolts and endwise-adjustable gibs, substantially as described.

6. The combination of the support having angular cheeks, the angular slideways supported thereon, with the angular gibs C C and the bolts E and F, for locking said slideways, substantially as described.

7. The combination of the support having angular cheeks, the slideways B, supported thereon and slotted substantially as described, with the gibs C and the locking bolts and nuts, all substantially as described.



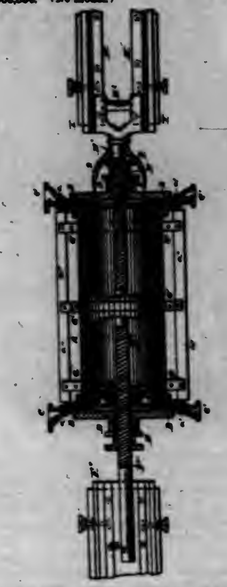
413,905. FURNACE-WALL. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 9, 1889. Serial No. 306,534. (No model.)

Claim.—1. A wall for furnaces and other purposes, composed of an internal lining of dense fire-brick, an external metal jacket, and intermediate layers of porous fire-bricks and refractory substance, substantially as described.

2. A furnace-wall composed of dense fire-brick lining, a layer of loose refractory material, a layer of porous fire-brick made as described, another layer of loose refractory material, and a metal jacket, substantially as described.

413,906. STEAM-BOILER. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 9, 1889. Serial No. 306,535. (No model.)

Claim.—1. In a tubular steam-boiler, the combination of a series of water-pipes with the flattened tubular connections C and the clamping-straps U, substantially as and for the purpose specified.



2. The combination of the connected series of water-pipes, the steam-dome, and the pipe connecting the upper series of water-pipes to said dome, with a propeller and casing, a pipe connecting the steam-dome and propeller-casing, and the pipe-connections between said casing and the lowermost series of water-pipes, all substantially as and for the purpose specified.

3. The combination of the supporting-walls and chimney and partitions arranged to form a zigzag flue between said walls, with a series of water-pipes extending through said walls and partitions, and the flattened tubular connections C for the extremities of said pipes, substantially as specified.

4. The combination of the water-pipes having ferruled ends, the clamping-straps U, the tubular flattened connections C, and the uniting-bolts, all substantially as described.

5. The herein-described tubular boiler, consisting of a series of water-pipes, supporting-walls therefor, partitions between said walls, the tubular flattened connections C for the water-pipes outside the walls, the steam-dome, the pipe-connections between the upper series of water-pipes and the dome, the pipes connecting said dome with the lowest series of water-pipes, and the inclosing-casing provided with a series of doors opposite the ends of the water-pipes, substantially as and for the purpose set forth.

413,907. STEAM-ENGINE. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 9, 1889. Serial No. 306,536. (No model.)

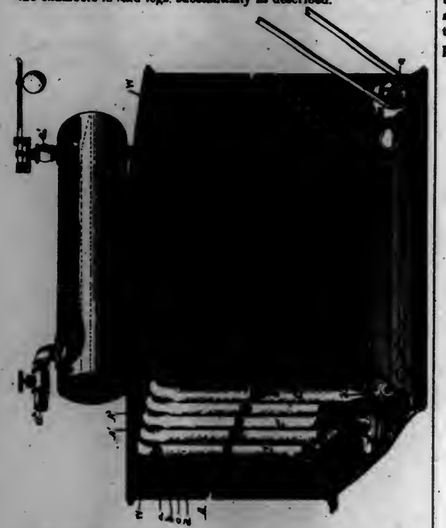
Claim.—1. The combination, with a cylinder in which works a piston, of a piston-rod which extends through stuffing-boxes in the cylinder-heads, and adjustable slideways for the cross-heads on the extremities of the piston-rod, substantially as described.

2. The combination of indicators with a cylinder and a piston-rod which is supported at both ends by adjustable slideways, substantially as described.

3. The combination of the cylinder and its supporting-bed, the piston-rod extending through both cylinder-heads and bearing indicators P, slideways for supporting the cross-heads of the piston-rod, and means for adjusting said slideways, all constructed and adapted to operate substantially in the manner and for the purposes described.

4. The combination of adjustable slideways, a piston-rod which extends through both cylinder-heads, and indicators thereon, substantially as described.

5. The combination of the cylinder and piston and piston-rod extending through both cylinder-heads with frames I at the opposite ends of the cylinder, slideways H, supporting the cross-heads of the piston-rod, the screws for adjusting these ways horizontally, the gibs for adjusting the ways vertically, and means for securely holding these slideways, substantially in the manner and for the purpose described.



413,908. STEAM-GENERATOR. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 9, 1889. Serial No. 306,537. (No model.)

Claim.—1. The combination, in a steam-generator, of a series of horizontal tubes jointed to independent vertical legs which are subdivided by partitions into two independent chambers, with return-tubes in said horizontal tubes, and a common horizontal pipe suitably supported and communicating with a steam-drum and with the legs, substantially as described.

2. The combination of a series of vertical legs subdivided by a diaphragm and communicating with a common supply-drum at their lower ends, with a series of horizontal tubes arranged one within the other and communicating, respectively, with the chambers in said legs, substantially as set forth.

3. A series of vertical pipes vertically subdivided into two inde-

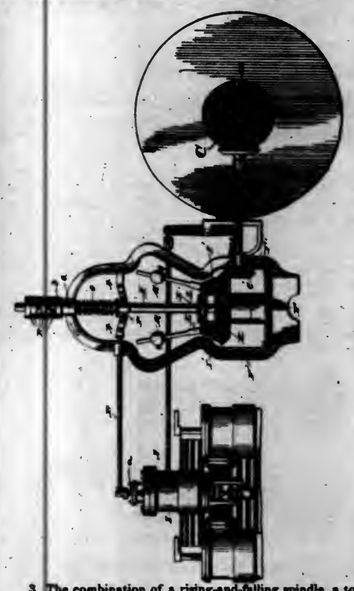
pendent water-circulating chambers, in combination with a lower communicating water-supply drum, pipes leading to a steam-drum from one of the water-chambers in each leg, and horizontal tubes arranged one within the other and communicating, respectively, with the chambers in said legs, substantially as described.

4. A steam-boiler consisting of a series of vertical water-legs C, and horizontal tubes closed at their outer ends and opening into one of the chambers of a vertical water-leg, in combination with internal tubes opening into one of the other chambers of the leg, a horizontal transverse base-pipe supporting the legs, and the water-supply thereto, all substantially as set forth.

5. The combination of a series of vertical water-legs C, horizontal tubes closed at their outer ends and opening into one of the chambers of a series of vertical legs, with internal tubes opening into one of the other chambers of the legs, a horizontal transverse base-pipe connected to said legs, a steam-drum, its connections with said legs, and a forcing-engine and its connections with said drum and base-pipe, substantially as set forth.

6. In combination with a series of vertical subdivided pipes C, having bent upper ends, a horizontal base-pipe communicating with the latter and provided with a feed-pipe, the pipe-communications with the steam-drum, and the horizontal internal and external tubes communicating with the said subdivided legs, all constructed and arranged substantially as specified.

7. The herein-described water-legs for tubular boilers, consisting of the metal tubular casting having an internal partition dividing its interior into two non-communicating chambers, openings through the outer wall into one of said chambers and through the partition into the other chamber, and having its upper end bent at right angles, substantially as specified.



8. In a steam-boiler, the combination of one or more vertical pipes subdivided by a vertical diaphragm forming two chambers, one of which is closed at its upper end and the other at its lower end, with a base-pipe, a steam-drum, a series of external tubes closed at their outer ends, a series of internal return-tubes open at both ends, and a series of short pipes connecting the upper ends of the vertical pipes to a horizontal pipe communicating with the steam-drum, substantially as described.

9. The combination, with the water-legs having two compartments, of the external water-tubes communicating with one of said compartments, a water-tube open at both ends and placed within the external tube and communicating with the other compartment of the water-leg, and a series of vertical partitions through which said tubes pass, all substantially as specified.

413,909. STEAM-GOVERNOR. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 10, 1889. Serial No. 306,638. (No model.)

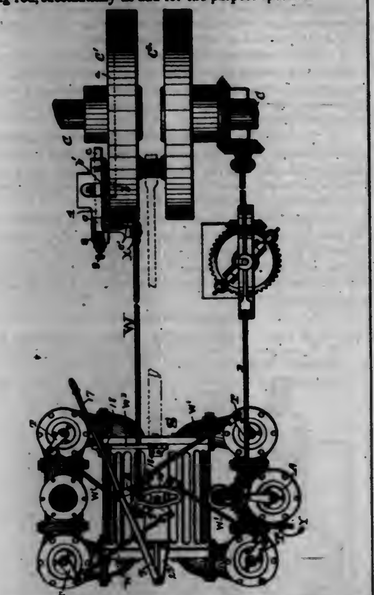
Claim.—1. The combination, with a vertically-movable spindle and the rod B and toggle-joint connecting said spindle with the stem of the main steam-valve, of the upright arms mounted on a rotatable support and loosely engaging the lower end of said spindle, and the governor-balls on the said arms, all substantially as and for the purpose set forth.

2. The combination, with the vertically-movable spindle, the toggle-joint loosely connected to said spindle, and the connection between the joint and the main steam-valve, of the upright arms mounted on a rotating support and carrying the governor-balls, and the means for transmitting motion from the main shaft of the engine to said support, all substantially as and for the purpose specified.

3. The combination of a rising-and-falling spindle, a toggle-joint connection between said spindle and the main steam-valve rod, a spring and weight applied to said spindle, and governor-balls mounted on upstanding pivoted arms, all constructed and adapted to operate substantially as described.

4. The combination of a vertically-movable governor-spindle and a toggle-joint connection between the same and the steam-valve, the arms bearing the governor-balls and jointed below the latter and mounted on a rotatable support, the grooved wheel keyed on the governor-spindle and receiving the lower ends of said arms, and the means for transmitting motion from the main shaft of the engine to said support, all substantially as and for the purpose set forth.

5. The combination of the vertically-movable spindle, the toggle-joint connection between the spindle and steam-valve, the upright pivoted arms carrying adjustable governor-balls and mounted on a rotatable support and loosely engaging said spindle, with the shaft and gear-connections between said support and the main engine-shaft, all substantially as described.



6. The combination of the spindle K, the weights R, and wheel I with the angular arms L, wheel H, adjustable balls M, and toggle-joint, all substantially as described.

7. The combination of the frame F, the vertically movable spindle K, journaled therein, the gear H, carrying said spindle, and the spring O, with the angular arms L L, pivoted on ears rising from gear H, the balls M thereon, and the grooved wheel I, and the connections between said spindle and steam-valve and between the gear H and main shaft, all substantially as and for the purpose described.

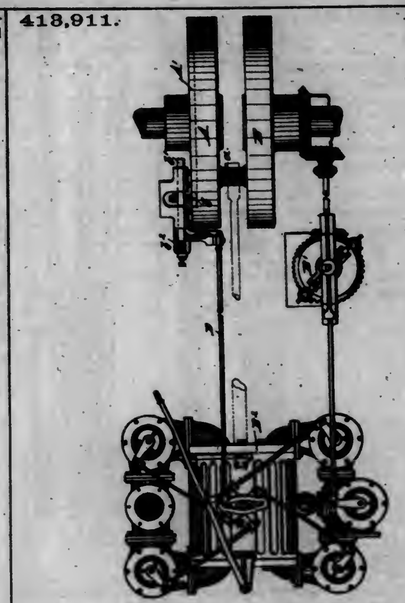
8. The combination of the upright vertically-movable and slotted spindle K and the toggle-joint N P N, engaging the slot therein, the grooved wheel I, angular pivoted arms L L, carrying balls M M, the rod B, connecting the toggle-joint with the main steam-valve, and the gears H D, and intermediate shafting and gearing between said gears, all constructed and arranged for the purpose and substantially as set forth.

413,910. VALVE-GEAR. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 10, 1889. Serial No. 306,639. (No model.)

Claim.—1. The combination of the engine-cylinder, its inlet and exhaust valves, and the spider for actuating the same, with the slotted plate above and rigidly secured to said spider, the connecting-rod adjustably attached to said plate, and the reversing-lever for shifting said connecting-rod, substantially as and for the purpose specified.

2. The combination of the spider *g*, connected to the inlet and exhaust valves of a steam-engine cylinder, with the slotted plate 15, connected to said spider, the connecting-rod W, loosely engaging plate 15, and the devices for shifting rod W, all constructed and arranged substantially as and for the purpose specified.

3. The combination of the engine-cylinder, its inlet and exhaust valves, and the spider *g*, pivoted on said cylinder and connected to the stems of the valves by rods W', with the slotted plate 15, rod W, connected thereto, the lever 17, and the link-connection between said lever and rod W, all as and for the purpose described.



4. The combination, in a steam-engine, of the cylinder, its inlet and exhaust ports, and the cam-grooved wheel on the main shaft, the roller playing in said groove, the slide actuated thereby, and the connecting-rod attached to said slide, with the spider mounted on the cylinder, and link-connections between the arms thereof and the valves, and the slotted plate supported by said spider, and the adjustable link-connection between the same and the connecting-rod, substantially as and for the purpose described.

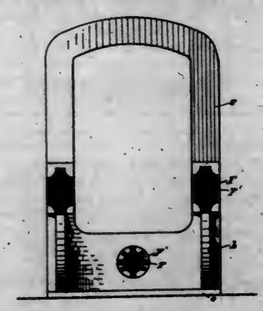
5. The combination of the cam-grooved wheel C, the slide *c*, its wrist-pin and roller *b*, and the connecting-rod W, with the steam-engine cylinder, its inlet and exhaust port valves, the spider mounted thereon and connected to said valves, the plate 15, secured to said spider and connected to rod W, the reversing-lever 17, the link 16, and shouldered bracket W^3, all substantially as and for the purpose described.

413,911. CRANK-WHEEL. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 10, 1889. Serial No. 306,640. (No model.)

413,911.

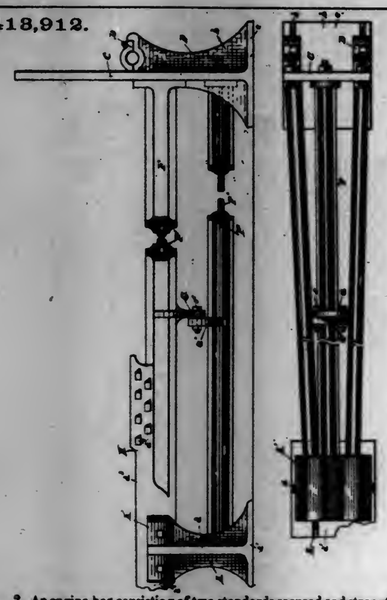
Claim.—1. The herein-described crank-wheel, having an annular groove in its face, in combination with diametrically-opposite segments secured to said wheel and forming parts of the walls of said groove, substantially as and for the purpose specified.

2. A crank-wheel for the purpose described, having a cam-groove A, with eccentric deflections formed by inserted segments, substantially as and for the purpose specified.



3. The combination, with the crank-wheel A, having an annular groove in its face, of the removable segments S S', secured in diametrically-opposite recesses in the face of the wheel respectively on the inner and outer sides of said groove, as and for the purpose specified.

4. The combination, with the annularly-grooved crank-wheel, of diametrically-opposite removable segments secured thereto and having their adjoining opposite ends dressed to form the deflections of said groove, as and for the purpose specified.

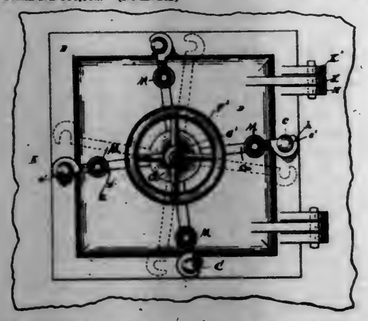


5. The combination, with the crank-wheel having an annular cam-groove in its face, substantially as described, of the roller *b*, having a yielding annular core b^2, a non-conducting layer b^3 exterior to said core, and a metal tire b^4, all substantially as and for the purpose specified.

413,912. ENGINE-BED. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 11, 1889. Serial No. 306,801. (No model.)

Claim.—1. An engine-bed consisting of two standards strengthened and secured together substantially as described, in combination with a concave receptacle on one of the standards and the shell supported on said receptacle, substantially as and for the purpose described.

418,912.



2. An engine-bed consisting of two standards secured and strengthened substantially as described, in combination with a concave receptacle on one of the standards, and a shell secured to such standard, substantially as specified.

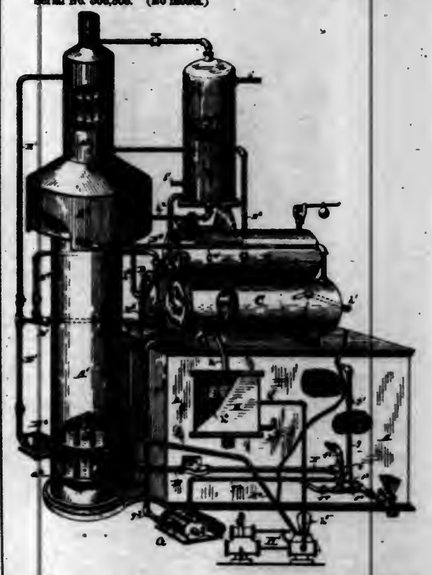
3. The combination of a standard having a shell secured to it, an arched standard provided with journal-boxes for the main shaft of an engine, and the bracing and tie rods, substantially as and for the purpose described.

4. The combination of the standards, a shell secured to one of said standards, braces and tie-rods for the same, and intermediate connections for said braces, constructed and arranged as and for the purpose specified.

5. The combination of the standards A' B', constructed substantially as described, a shell H, secured to one of said standards, braces and tie-rods for the same, and the intermediate connections for said braces, all as and for the purpose specified.

418,918. FURNACE-DOOR. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 11, 1889. Serial No. 306,902. (No model.)

Claim.—1. The combination, with a rectangular double-hinged furnace-door having a rib on its inner face, a door-frame having a rectangular gasket to receive said rib, and four headed lugs equidistant from each other, of the spider having four radial locking-arms having notched ends, and the screw-clamping device for forcibly seating the door when closed, all constructed and adapted to operate substantially as and for the purposes described.



2. The combination, with the door-frame having an angular gasket and four headed lugs at equidistant points, of a door hinged by loose joints to said frame and having an angular rib adapted to engage said gasket and a central screw-threaded post, the four radial locking-arms engaging said headed lugs and the central post of the door, and the screw-clamping devices for forcibly seating the door when closed, all substantially as and for the purpose specified.

3. The combination of the door-frame having a gasket and the door having a rib engaging said gasket, with a spider having arms engaging lugs projecting from said frame, and the screw-bolts in said arms engaging and locking the door when closed, as and for the purpose specified.

4. The combination of the door-frame having a gasket and posts C, and the door loosely hinged to said frame, having a central screw-threaded post D^2, with the socket-piece F, engaging said post D^2, and the spider having a hub G^2, and radial arms G, mounted on piece F, all constructed substantially as described.

5. The combination, with the door-frame, its gasket J, the door D, having an angular rib engaging said gasket and a central screw-threaded post and loosely hinged to said frame, with the screw-threaded socket F, radial arms G G, engaging lugs on said frame, and the screw-bolts M on said arms, all substantially as and for the purpose described.

418,914. WATER-HEATER. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 11, 1889. Serial No. 306,903. (No model.)

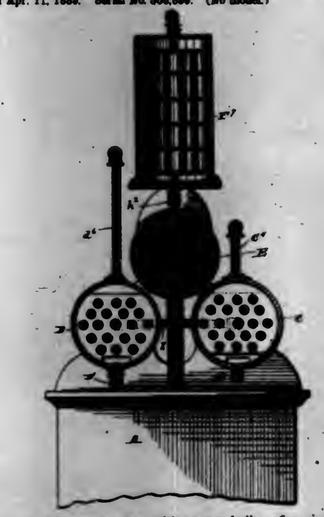
Claim.—1. In an apparatus for purifying water for steam-boilers, the combination of a purifier provided with feed and outlet pipes and siphons with a casing provided with steam-inlet pipes, substantially as described.

2. In an apparatus for purifying water, the combination of a purifier provided with siphons and a reticulated diaphragm, and also with a feed-pipe, a steam-outlet pipe, and a sediment-cock, substantially as described.

3. In an apparatus for heating and evaporating water for steam-boilers and other purposes, the combination, with a series of communicating pipe-coils arranged in a suitable casing, of steam-pipes open at one or both ends and applied longitudinally and centrally inside of the straight portions of the said coils and in communication with the steam-space of said casing at the bends of the coils, substantially in the manner and for the purposes described.

4. A gang or bank of water-circulating coils arranged inside a casing, in combination with steam-pipes inside said coils and a series of alternate diaphragms arranged between the pipe-coils, substantially as described.

5. A gang or bank of water-circulating coils arranged inside of a steam-casing, in combination with steam-pipes inside the straight portions of the said coils, plugged at one end and communicating with the steam-space at the other end, substantially as and for the purpose specified.



6. The combination of the casing provided with steam inlet and outlet pipes, a bank of water-circulating coils, a series of short straight steam-pipes in said coils, and tubular conical plugs holding said steam-pipes in their places, substantially as described.

7. The combination of a casing having steam-inlet pipes and a coil of pipes communicating with a steam-boiler, in combination with a purifier consisting of siphons arranged in a case and communicating with the interior of the said casing, and the feed and steam-outlet pipes, all constructed and arranged to operate substantially in the manner and for the purpose specified.

8. The combination of a casing provided with steam inlet and outlet pipes, a bank of water-circulating coils of pipe, steam-pipes through the horizontal portions of said coils, and a series of alternating diaphragms between the coils forming serpentine channels for the circulation of steam through the casing, substantially as and for the purpose described.

9. In a water heater and purifier, the combination of the casing, a vessel secured therein having a case provided with siphons, and water feed and drain pipes, with a coil of water-circulating pipes below said vessel and a series of steam-pipes arranged inside the horizontal limbs of said coils, all substantially as and for the purpose specified.

418,915. STEAM-CONDENSER AND AIR-HEATER. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 11, 1889. Serial No. 306,899. (No model.)

Claim.—1. The combination, with a steam-boiler, of an air-heater A', the steam-condenser and air-heater communicating with heater A', the air-forcing pump, and the water-pump and exhaust-steam supply, all substantially as described.

2. The combination, with the furnace and boiler, of the condensers C D, the pump communicating therewith, and the exhaust-steam supply thereto, with the air-heater A', the gas-trap A^2, and the pipes connecting the condensers with the heaters and gas-trap, and the engines E^2 and G, all constructed and arranged substantially as specified.

3. The combination, with the steam-boiler furnace, of the condensers C, D, and F^7, and the water-heater H, the pump H', communicating with the said condensers and with a coil in heater H, and the exhaust-steam supply to said heater, all substantially as and for the purpose set forth.

4. The combination, in a steam-boiler furnace, of the air-heater A' and gas-trap A^2, with the steam-condenser C, communicating with the gas-trap and with an exhaust-steam supply, the steam-condenser D, communicating with heater A' and condenser C, and the air, gas, and water forcing engines, all constructed and connected substantially as and for the purpose specified.

5. The combination of the condensers C, D, and F^7, and the exhaust-steam supply thereto, with the pump H', and the pipe H^5 and its branches H^7 H^8, and the connections between said pump and boiler, all constructed and arranged substantially as specified.

6. The combination, in a steam-boiler furnace, of the air-heaters A' A^2, the condensers C and F^7, the air-pump E^2, and water-pump H' and heater H, all substantially as and for the purpose set forth.

7. The combination of the heaters A' A^2 and gas-trap A^2, with the condensers C and D, water-heater H, the air and gas forcing engines, and the pump H', substantially as and for the purpose described.

8. The combination, with the steam-boiler furnace and the air-heater and gas-trap, constructed substantially as described, of the air and gas forcing engines, the air and gas supply pipes F and g^8, and the valved branch pipes connecting therewith, all constructed and arranged substantially as specified.

9. The combination, with the furnace and boiler, the air-heaters A' A^2, and water-heater H, of the gas-trap A^2, the condensers C, D, and F^7, and the air, gas, and water pumps, and pipe-connections, all substantially as and for the purpose set forth.

418,916. FURNACE. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 12, 1889. Serial No. 306,972. (No model.)

Claim.—1. The combination, with the ash-pit of a furnace, of a blast-pipe, a fuel-chamber provided with a passage at the end of the grate leading from said ash-pit into said chamber, and means for supplying fuel to said blast-pipe, whereby the ashes or fuel are blown into the latter, substantially as described.

2. The combination, in a furnace, of a fire-wall having a space outside of the grate, forming a communication between the ash-pit and fuel-chamber, with means for regulating the size of said space and a blast-pipe and fuel-feeder applied thereto, substantially as described.

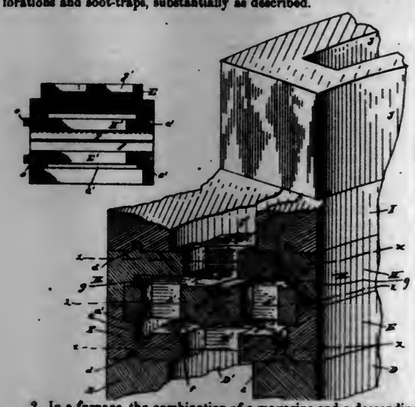
3. In combination with a furnace having a passage outside of the grate area, a blast-pipe below the grate provided with curved perforated branches, substantially as described.

4. The combination, with a furnace having a passage outside of its grate area in or through its wall, of a blast-pipe in its ash-pit provided with apertures which converge to said passage.

5. A furnace having a blast-passage leading directly from its ash-pit, through its wall facing the door thereof and outside of the grate, to the combustion-chamber above the grate, in combination with a blast and a fuel-feeder, constructed and arranged to operate substantially as described.

6. The combination, with a furnace, of one or more blast-pipes leading into the ash-pit thereof, means for allowing the ashes to be blown from said pit into the fuel-chamber, means for regulating the size of the passage leading into said chamber, and a removable block applied at the upper terminus of said chamber, substantially as described.

7. The combination of a fuel-feeder arranged below a furnace-grate and a passage leading from the ash-pit to a point above the grate, substantially as described.



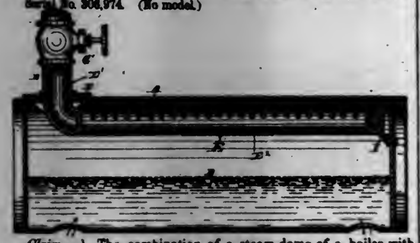
8. The combination, with a furnace, of a blast-pipe and a fuel-feeder, substantially as specified, whereby pulverized fuel is supplied to the ash-pit of a furnace and forced by a blast up through the grate and also above the grate, substantially as described.

9. The combination of the ash-pit and fuel-chamber, having communication between them outside of the margin of the grate, with an injecting-pipe, a blast-pipe, and a pulverized-fuel feeder, substantially as described.

10. The combination, with a furnace, of an injecting-pipe thickly perforated and located on or near the floor of the ash-pit, a blast-pipe F, provided with a regulating-cock, an automatic pulverized-fuel feeder, and a feed-hopper provided with a regulating-valve, all constructed and adapted to operate substantially as described.

418,917. MIXING-CHAMBER FOR FURNACES. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 12, 1889. Serial No. 306,973. (No model.)

Claim.—1. In a furnace, the combination of the flue or magazine and a descending flue communicating therewith with mixing-chambers composed of layers of fire-bricks having central vertical passages through them and the intermediate fire-bricks having perforations and soot-traps, substantially as described.

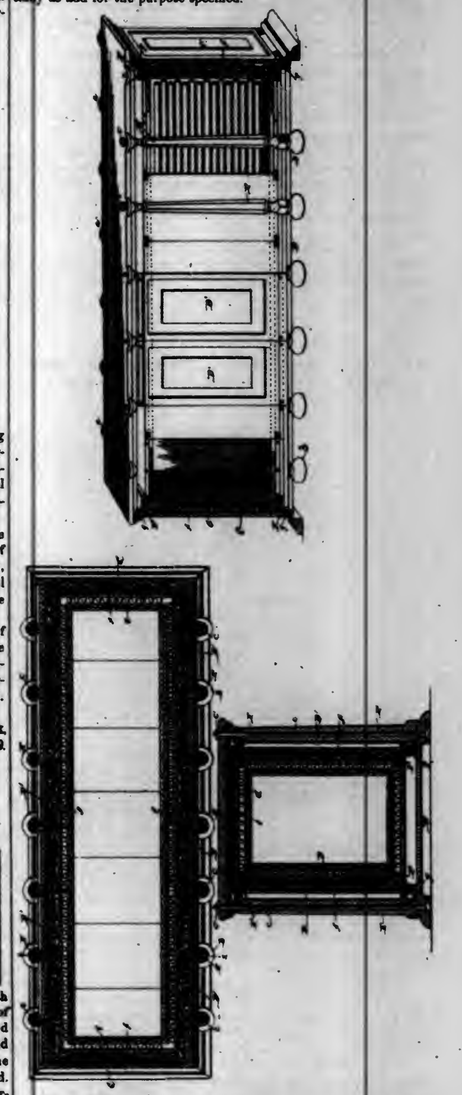


2. In a furnace, the combination of a magazine and a descending flue communicating therewith at its upper end with the mixing-chambers composed of bricks F, having vertical passages and soot-traps, and the upper and lower bricks E and H, also having vertical passages and communicating with the passages of bricks F, all substantially as described.

3. In a furnace, the combination of a flue through which the gases are caused to descend with mixing-chambers composed of layers of fire-bricks E and H, having vertical passages through them, and the fire-bricks F, having vertical openings of different superficial area to the openings in bricks E and H and interposed between the same, substantially as and for the purpose specified.

4. A cellular or chambered fire-brick for the mixing-chamber of furnaces, constructed with a tenon on one end and a mortise on the opposite end and ribs and recesses in its upper and lower sides, respectively, said brick having a passage through it of varying superficial area and also provided with soot-traps, substantially as specified.

413,918. STEAM-DRUM. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 12, 1889. Serial No. 306,974. (No model.)



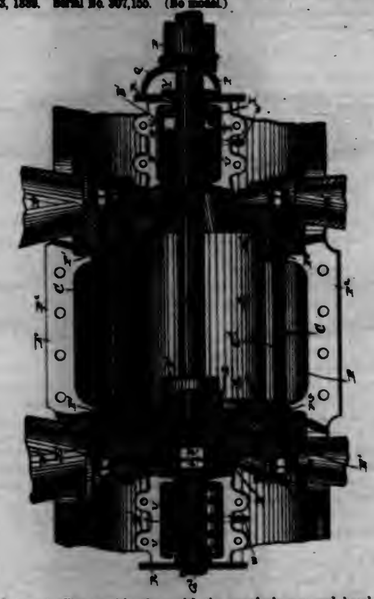
Claim.—1. The combination of a steam-dome of a boiler with an angular pipe having a horizontal leg entering the upper part of the dome and numerously perforated above its horizontal axis in said dome, and a vertical portion extending through the dome-shell and provided with a throttle-valve and a flange and a support for the inner end of said leg, all substantially as and for the purpose specified.

2. The combination, with a steam-drum, of a pipe which is perforated on its upper part and which is sustained at both ends, substantially as described, whereby it is allowed to expand and contract freely, and having an angular end extending through an opening in the drum, substantially as set forth.

3. The combination of the steam-drum A, the pipe E, perforated, as described, and bent at one end, the steam-cock applied to said pipe, and the flange connecting the said pipe to the drum A, and the support for the free end of the pipe within the drum, all constructed and arranged as and for the purpose specified.

413,919. STEAM-BOILER CASING. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 12, 1889. Serial No. 306,975. (No model.)

Claim.—1. A casing consisting of non-conducting walls composed of sections secured together by hollow pillars and stay-bolts, substantially as and for the purpose specified.



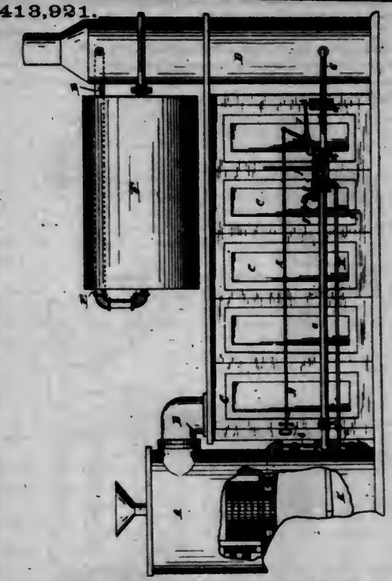
2. A casing the walls of which are respectively composed of a studded plate covered interiorly with a poor conductor of heat, an external wall, and an intermediate space filled with refractory material, substantially as specified.

3. A casing consisting of a top wall A, a base B, and walls C, and side walls formed of removable panels which are non-conductors of heat, secured together substantially in the manner and for the purpose specified.

4. The herein-described casing, consisting of a non-conducting top having lugs *a* on it, a non-conducting base, also having lugs on it, non-conducting end walls, angle-irons F, hollow pillars, tie-bolts, and removable panels, all constructed and arranged substantially in the manner and for the purpose specified.

413,920. STEAM-ENGINE CYLINDER. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 13, 1889. Serial No. 307,155. (No model.)

Claim.—1. The combination, with the annularly-recessed heads and the thin tube confined between the same, of the semi-cylindrical flanged supporting-shell sustaining the heads, substantially as specified.



2. The combination of the tube, the annularly shouldered and recessed heads having inlet and outlet steam passages fitted on the ends of said tube, and the confining-bolts therefor, with the supporting semi-cylindrical shell for said heads and the non-conducting filling between the casing and tube surrounding the latter, all substantially as set forth.

3. The combination, with the tube A and the annular casing thereof, of the heads B B, having boxes B' B', and the piston and piston-rod, all substantially as and for the purpose described.

413,921. AUTOMATIC APPARATUS FOR SUPPLYING AIR TO FURNACES. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 13, 1889. Serial No. 307,156. (No model.)

413,921.

Claim.—1. The combination, with a furnace and boiler, of an air-blast pipe having branches that enter, respectively, the ash-pit and the combustion-chamber of the furnace, provided with regulating-valves and a balanced valve actuated automatically by steam, and a loaded lever, substantially as set forth.

2. The combination, with a furnace and boiler, of the air-blast pipe having branches that enter, respectively, the ash-pit and combustion-chamber of the boiler, and a balanced valve actuated automatically by steam and a loaded lever, and a steam-supply pipe connecting the boiler with the ash-pit of the furnace and provided with a regulating-valve, as set forth.

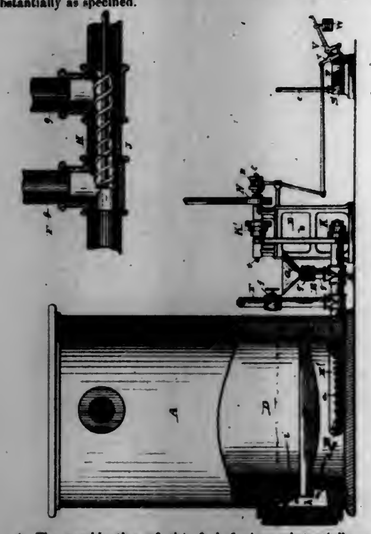
3. The combination, with a furnace and boiler, of the air-blast pipe, the steam-supply pipe, a balanced valve operated automatically by steam and a loaded lever, and a valve in the steam-supply pipe connected by a system of levers with the stem of the balanced valve, so as to be operated automatically and simultaneously with the latter, substantially as described.

4. The combination, with a furnace and boiler, of the air-blast pipe having a balanced valve, steam-supply pipe having valve *i*, the lever *j*, link *k*, toothed levers *e e'*, link *f*, steam-cylinder *g*, link g^6, and the loaded lever J, all arranged and operating substantially as set forth.

5. The combination of the valve-box having three branches with the valve pivoted at the junction of said branches, whereby the pressure against its upper and lower ends is caused to balance said valve in whatever position it may be made to assume, substantially as and for the purpose specified.

6. The combination of a balanced valve having the stem at the middle of its length with a valve-box having three branches, said valve being pivoted to the box at one angle, formed by the junction of the lateral and main pipe branches, and the main pipe branches being in the same axial line, substantially as described.

7. The combination, with a furnace, of an air-supply pipe entering the same, a three-way-valve box applied to said pipe, and a valve in said box actuated automatically by the pressure of steam from the boiler and a loaded lever, substantially as described.



413,922. FURNACE. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 13, 1889. Serial No. 307,157. (No model.)

Claim.—1. The combination, with the pulverized-fuel feeder and the blast-pipe, of the cone-pulleys, their belt, the belt-pulley, the clutch, and means for automatically actuating this clutch and starting or stopping the feed at certain determined pressures of steam, substantially as described.

2. The combination, with a furnace and a pulverized-fuel feeder, substantially as described, of the shafting and clutch connecting with said feeder, and the means for automatically operating this clutch to

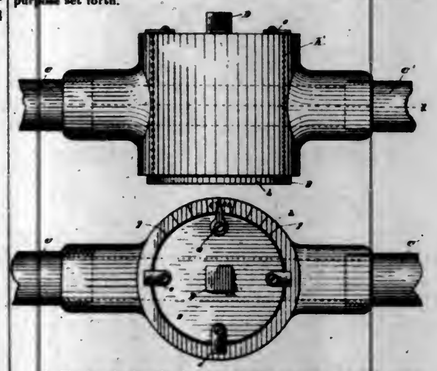
start or stop the feed at a certain predetermined pressure of steam, all as and for the purpose specified.

3. The combination of a furnace and a fuel-feeder therefor with the shaft driven by an engine and operating said feeder, the clutch engaging said shaft, and the devices, substantially as described, for automatically actuating said clutch to start or stop the feeder, all substantially as specified.

4. The combination of the fuel-feeder, substantially as described, the blast-pipe connecting therewith, the steam-cylinder, its weight-controlled piston, and the connections between the same and the fuel-feeder, whereby the latter is automatically stopped or started at a certain boiler or steam pressure, substantially as and for the purpose described.

5. In combination with a furnace, an automatic pulverized-fuel feeder, an air-blast, pulleys and belts for actuating the feeder, a clutching device, a steam-cylinder communicating with a boiler and provided with a piston loaded as described, and the connections between the piston-rod and said clutching device, substantially as specified.

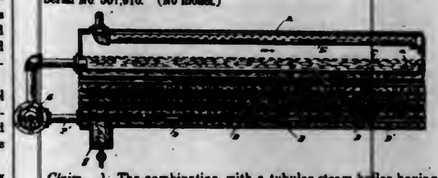
6. The combination of the injecting-pipe and a conveyer-screw arranged therein, a fuel-feed hopper, the shafts and pulleys for driving said conveyer, and the automatically-operated clutch engaging one of said shafts, whereby the conveyer is stopped or started, substantially as and for the purpose set forth.



7. The combination of the injecting-pipe arranged in an ash-pit of a furnace below the grate, with a conveyer-screw applied in a cylinder outside of the furnace, a fuel-feed hopper, a blast-pipe communicating with said cylinder, and regulating-valves applied to the neck of the hopper and to the said blast-pipe, all substantially as and for the purpose described.

8. The combination, with a furnace, an automatic pulverized-fuel feeder, cone-pulleys and belts for operating said feeder, and the feed-hopper and its valved neck, of the steam-cylinder, its piston, the weighted lever connected thereto, and the clutch on one of the cone-shafts, and the connections between said clutch and the piston, all constructed and arranged substantially as set forth.

9. The combination, with a furnace having an injecting-pipe below its grate, a casing connecting therewith, having a feed-hopper and a rotary screw-conveyer in said casing, the cone-pulleys and belts, and the clutching device, of the air-blast pipe valved as described and communicating with said casing, the steam-cylinder, its weighted lever and piston, and the connections between the piston and clutch, all constructed and arranged to operate for the purpose and in the manner specified.

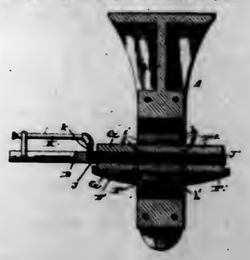


413,923. VALVE. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 15, 1889. Serial No. 307,369. (No model.)

Claim.—1. The herein-described registering-valve, consisting of a cylindrical casing A, having diametrically-opposite sockets A' A', engaging the connecting-pipes, and the bores of said sockets being rectangular in cross-section adjoining the valve, with a cylindrical valve having a diametrically-rectangular passage corresponding to the bores of the sockets in section, said valve occupying the entire interior of the cylinder and suitably confined therein, and the registering or indicating marks and finger on said casing and valve, all as and for the purpose set forth.

2. The herein-described valve, for the purpose specified, consisting of a cylindrical casing A, having diametrically-opposite sockets A' A', internally screw-threaded at their outer ends and having the inner portions of their bores rectangular, the cylindrical portion of the casing having index-marks *g g* on one edge, with the cylindrical valve B, having a diametrical passage B', rectangular in cross-section and fitted in said casing and confined therein by a flange *b* on one end and by a series of fingers *c* fixed on its other end, moving with the valve, and the indicator-finger G and post D, all substantially as described.

413,924. STEAM-BOILER. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 17, 1889. Serial No. 307,610. (No model.)



Claim.—1. The combination, with a tubular steam-boiler having a diaphragm C, a series of tubes below said diaphragm, and a steam-space above the same, of an exhausting and forcing pump communicating with the spaces above and below said diaphragm, substantially in the manner and for the purposes described.

2. The combination, with a steam-boiler, of the diaphragm having an aperture at one end, the flues below this diaphragm, the vertical partitions in the flue-space, a pump, and its pipe-connections with the spaces above and below said diaphragm, substantially as described.

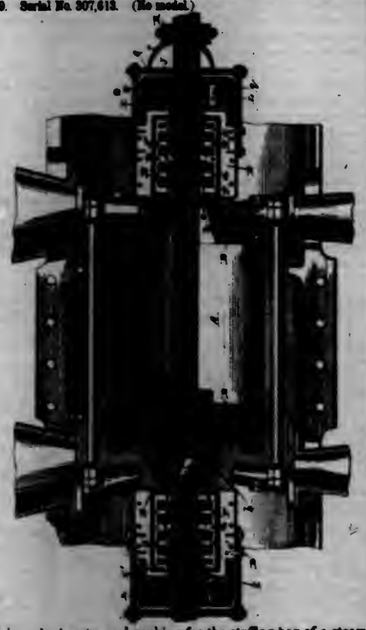
3. A compound steam-boiler consisting of a series of boiler-sections arranged one above the other and united by diaphragms, each perforated at one end, in combination with flues, the partitions arranged as described, and a pump, substantially as described.

413,925. LUBRICATOR AND COOLER FOR SHAFTS. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 17, 1889. Serial No. 307,611. (No model.)

Claim.—1. A hanger for shafts, provided with half-boxes, in combination with adjustable blocks, a continuous ring, and a balanced journal-box, substantially as described.

2. The combination of the shaft having a closed bore in its journal and pipe rotating with and exterior to said shaft and communicating with said bore, said bore and pipe being provided with heat-diffusing fluid for cooling the journal, substantially as specified.

3. The combination of the block C, having oil-receptacles, a journal-box balanced by a knife-edge on said block, and oil-feed rings for the shaft, substantially as described.



4. The combination of the shaft having a closed bore in its journal and a pipe communicating with said bore and rotating with said shaft with the slotted journal-box, the block having an oil-receptacle, and the lubricating-ring suspended on said shaft and passing through the slot in the journal-box, substantially as and for the purpose specified.

5. The combination of the hanger A, the serrated blocks having the oil-receptacles therein, the balanced journal-box, and the lubricating-ring, substantially as described.

6. In a hanger for shafts, the combination of the serrated half-boxes, the blocks vertically adjustable in the same and provided with recesses or notches, and the reversible journal-box having knife-edges, substantially as described.

7. The combination of the block having oil-receptacles, a journal-box balanced therein by a knife-edge, and oil-feed rings for the shaft with the shaft having a closed bore through its journal, and a pipe rotating with said shaft and communicating with said bore and adapted to receive heat-diffusing fluid therein, substantially as described.

413,926. PISTON-ROD PACKING. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 17, 1889. Serial No. 307,613. (No model.)

Claim.—1. A piston-rod packing for the stuffing-box of a steam-engine cylinder, consisting of packing-rings applied in annular cavities, in combination with means for conducting a current of water or other fluid through an annular cavity between the rings in the stuffing-box, substantially as described.

2. The combination, with the stuffing-box, of the cylindrical box centered and secured therein by a Babbitt or soft metal filling, substantially as and for the purpose specified.

3. The combination of the stuffing-box, the cylindrical interiorly-channeled box secured therein, and the packing-rings resting in the annular cavities of the latter box, and the stuffing-annulus I, constructed and arranged substantially as and for the purpose specified.

4. The combination of the stuffing-box having an internal annular cavity and annular grooves on each side of said cavity with packing-rings fitted in said grooves and the water inlet and outlet pipes leading to and from said cavity, as and for the purpose set forth.

5. The herein-described stuffing-annulus I, having flanges I' and conical flaring mouth *i*, as and for the purpose described.

6. The combination of the annulus having a conical bore, a conical soft-metal plug, and a screw-cap, all substantially as specified.

7. The combination of the stuffing-box having horizontally-divided walls, the divided packing-rings, and longitudinally-divided cylindrical annularly-grooved box, constructed and arranged substantially as specified.

8. The combination, with the stuffing-box and the stuffing-annulus I, having a conical bore, of the conical packing J and the screw-cap, constructed and arranged substantially as set forth.

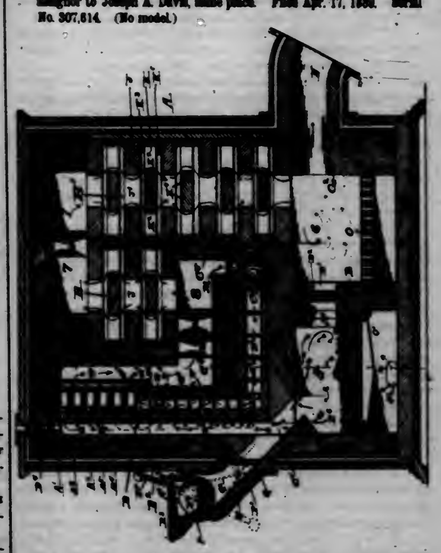
9. The herein-described box F F, consisting of two semi-cylindrical pieces having semi-annular grooves in them and united, substantially as set forth.

10. The combination, with a stuffing-box having a conically-bored extension at its end, of the conical soft-metal stuffing-ring, the screw-cap engaging threads on the stuffing-box for tightening said conical ring, and also having an auxiliary stuffing-box in its extremity, for the purpose and substantially as described.

11. The combination, in a piston-rod packing, of the cylindrical annularly-grooved box F F, the packing-rings H H, annulus I, and the plug J, substantially as described.

12. The combination, in a stuffing-box, of the half-boxes F F, internally grooved, the soft-metal packing G, packing-rings H, and stuffing-annulus I, all substantially as described.

13. The combination of the cylindrical internally-grooved box F F, the packing-rings H H, annulus I, and the water-supply pipes, all substantially as described.



14. The combination of the half-boxes F F, rings H, annulus I, plug J, and screw-cap L, all substantially as set forth.

15. The combination, with the cylinder-head and piston-rod, of the annular plate E, substantially as set forth.

16. The combination, with the cylinder-heads having exterior stuffing-boxes and the piston-rod extending therethrough, of the annular plates fitted around the piston-rod and secured loosely to the inner faces of the cylinder-heads, all substantially as set forth.

17. The combination, in a piston-rod packing, of the half-boxes F F, the packing G, the packing-rings H H, packing-annulus I, plug J, and the screw-cap for compressing said plug, all constructed and arranged substantially as and for the purpose specified.

413,927. FURNACE. VIRGIL W. BLANCHARD, New York, N. Y., assignor to Joseph A. Davis, same place. Filed Apr. 17, 1889. Serial No. 307,614. (No model.)

Claim.—1. In a furnace, the combination of the fire-chamber, a compartment in the furnace above the chamber, a partition dividing the said compartment into an ascending and a descending flue, said ascending flue communicating with the fire-chamber, and the descend-

ing flue communicating with the outlet-passages, the said partition having in its lower portion a vertical air-passage with a series of lateral jet-openings leading therefrom, and in its upper portion a series of independent transverse mixing-channels leading from one flue to the other, substantially as and for the purposes described.

2. In a furnace, the combination of the ascending flue communicating with the fire-chamber, the descending flue, the partition between said flue having air-passages and jet-openings, and the ascending series of mixing-chambers communicating with the descending flue, and the descending series of mixing-chambers communicating with the ascending series and with the outlet, substantially as described.

3. The combination, in a furnace, of a primary fire-chamber communicating with a series of flues, and mixing-chambers in the upper part of the furnace communicating with the flues and with an outlet, a secondary fire-chamber communicating with said outlet, and a damper between said fire-chambers, as and for the purpose specified.

4. The combination of the primary fire-chamber, the ascending and descending flues above the same separated by a partition having air-passages and jet-openings, substantially as described, the secondary fire-chamber, and a series of ascending and descending mixing-chambers communicating with said secondary chamber and with said descending flue, substantially as described.

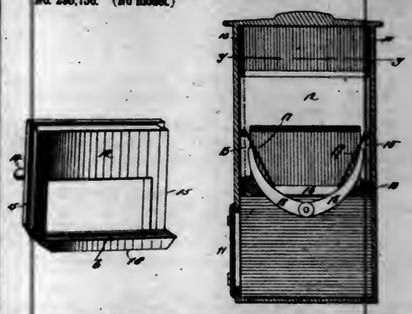
5. In a furnace, the combination of a fire-chamber, the roof above the same, the ascending flue communicating with the fire-chamber, and descending flue above said roof separated from the ascending flue by an intermediate partition having air-passages and jet-openings, substantially as described, with the tortuous air-channel in said roof communicating with the air-passage in said partition and the air-supply thereto, all substantially as set forth.

6. In a furnace, the combination of an ascending flue communicating with the fire-chamber and a descending flue, with a partition between said flues, the lower portion of which has a central air-passage and lateral jet-openings leading therefrom, and its upper portion having vertical air-passages connecting with said central air-passage, and also having transverse gas channels or passages communicating with the ascending and descending flues, substantially as and for the purpose described.

7. The combination, in a furnace, of a fire-chamber having a closed roof in which is a tortuous air-heating passage, a pair of vertical flues above said passage communicating, respectively, with the fire-chamber and with passages leading to the outlet, and a partition separating said flues having air-passages communicating with the said tortuous air-heating passage, jet-openings, substantially as described, a series of mixing-chambers communicating with the lower end of the inner vertical flue, and a series of mixing-chambers communicating at top with the aforesaid chambers, and at bottom with an outlet, said chambers having soot-traps, substantially as described.

8. In a furnace, the combination of the fire-chamber, the ascending and descending flues, closed at top and separated by a partition having air-passages, perforations, and channels, substantially as described, and a safety-valve connected to the top of one of said flues for regulating the pressure of gases therein, substantially as and for the purpose described.

9. The combination of the primary fire-chamber, the ascending flue above the same communicating therewith, the descending flue, and the partition between said flues, channeled and perforated for the passage of air and gases, and a gas-supply pipe leading from the outlet or uptake of the furnace and communicating with one of said flues, substantially as and for the purpose described.



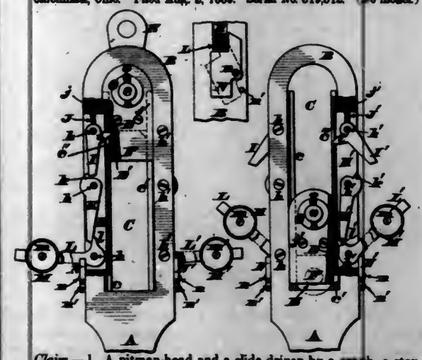
10. The combination of the fire-chamber, the ascending flue communicating therewith, and the descending flue above said chamber, separated from the ascending flue by a partition channeled and perforated for the passage of air and gases, substantially as described, the tortuous air-passage formed in the roof of said fire-chamber and communicating with the air-channels in said partition, the air-supply pipes communicating with said passage and ash-pit, and the gas-supplying pipes, all substantially as set forth.

11. The combination of the fire-chamber, the vertical flue communicating therewith, the descending flue separated from said vertical flue by a partition having passages, channels, and soot-traps, substantially as described, and the tortuous channel in the roof of the fire-chamber communicating with the air-passages and with a supply for heating the air supplied to the passages in said partition, substantially as set forth.

12. The combination of the fuel-chamber, the vertical ascending flue communicating with the fire-chamber, the descending flue, the partition between said flues having air-passages, channels, and jet-openings, substantially as described, and the air-heating channel in the roof of the fire-chamber communicating with an air-supply and with the passages in said partition, the air-supply pipe *a c*, and gas-supplying pipes *f g*, all substantially as and for the purpose set forth.

13. The combination of the furnace having a primary fire-chamber 5, an auxiliary fire-chamber 6, a closed roof formed with an interior air-heating channel D' over chamber 5, the vertical ascending flue communicating with chamber 5, and the descending flue, and the vertical partition separating said flues having air-passages and perforations, substantially as described, with the series of mixing-chambers H, the trapping-chambers 7 and 8, and the descending series of mixing-chambers H', communicating with the chambers 6 and 7, the outlet from said chambers, and the air and gas supply pipes, all substantially as described.

418,928. LETTER-BOX. WILLIAM COOK, New York, N. Y., assignor to himself and Paul D. Reed, same place. Filed Jan. 3, 1889. Serial No. 295,756. (No model.)



Claim.—1. The combination, with a case provided with a receiving-opening, of a slide normally covering said opening, leaves pivotally connected to the case-walls, and pivotally-mounted arms which bear against the leaves and against which the slide bears, substantially as described.

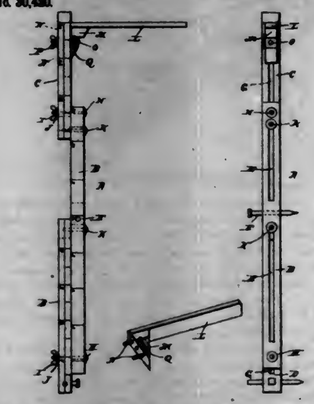
2. The combination, with a case, of leaves hinged therein, arms pivotally mounted within the case beneath the leaves, a slide arranged in connection with an opening formed in the case, and connections between the slide and the arms, whereby when the slide is raised the arms will be moved inward and the leaves upward, substantially as described.

3. The combination, with a case formed with an opening *a* and a lip I9, of a slide mounted to normally close the opening *a* and formed with downwardly-extending arms that are connected to a longitudinally-slotted cross-bar, arms pivotally mounted within the case and arranged to extend upward through the cross-bar slot, and leaves pivotally mounted above the arms and below the case-lip, all arranged substantially as described.

418,929. PITMAN. JONATHAN CREAGER and HARRY M. CREAGER, Cincinnati, Ohio. Filed Aug. 2, 1889. Serial No. 319,512. (No model.)

Claim.—1. A pitman-head and a slide driven by a crank, a stop that locks said slide to said head, and automatic devices that liberate said stop and thereby release said slide whenever a certain pressure is exceeded, substantially as described.

2. A pitman-head having a longitudinal slot or groove, a slide driven by a crank and traversing said slot or groove, a trip-lever having a stop that locks said slide within said slot, and a system of levers operated by said trip-lever, one of the levers of said system having a weight applied to it, substantially as described.



3. The combination of slotted pitman-head B, guides *e f*, slide D,

pivoted trip-levers I I', intermediate levers K K', and levers L L', which latter are provided with weights M M', for the purpose described.

4. The combination, with a slotted pitman-head, of a slide driven by a crank and traversing said slot, a system of levers that automatically liberate said slide, as herein described, a pair of weighted levers and a pair of drop-catches pivoted to said head, and a pair of stops that arrest said catches, for the purpose stated.

5. The combination, with a slotted pitman-head, of a slide driven by a crank and traversing said slot, a system of levers that automatically liberate said slide, as herein described, and a pair of springs, as J J', that bear against the trip-levers I I' of said system, for the purpose stated.

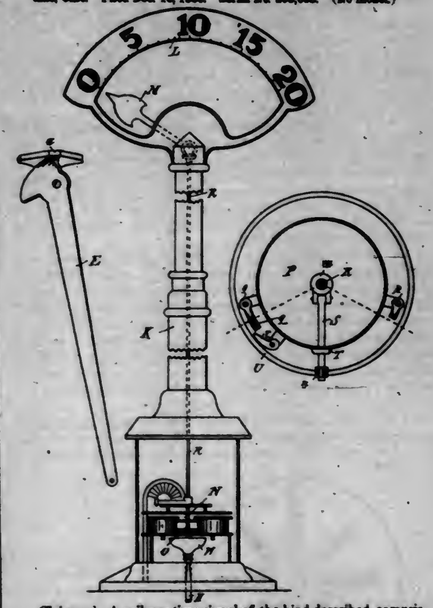
418,930. MEASURING-ROD. WILLIAM DERBOLL, Brockville, Ontario, assignor to James H. Conner, Ottawa, Canada. Filed Jan. 30, 1889. Serial No. 298,068. (No model.) Patented in Canada Dec. 17, 1883, No. 30,430.

Claim.—1. A measuring-rod comprising the sections B C D, the central section B having the longitudinal slots E, and the end sections C D having the longitudinal slots G, the bolts H, secured in the ends of section B and passing through the slots G in the sections C D, the nuts and washers on the ends of said bolts, and the bolts K, inserted through the slots E in the central section B and into the inner ends of the sections C D, as set forth.

2. The combination of the central section B, the end sections C D, secured thereto and longitudinally adjustable thereon, and the arm L, secured to and projecting laterally from the section C and adjustable along the same, as set forth.

3. The combination of the central section B, the end sections C D, having the longitudinal slots G and adjustably secured to the central section, and the arm L, adjustably secured to the section C and provided with a bracket M, having pins N, engaging the slot G, as set forth.

4. The combination of the central section, the end sections adjustably secured thereto, the arm L, having a bracket at one end adjustably secured to one of the end sections, and the plummet pivoted to said bracket, as set forth.



5. The combination of the central section, the end sections adjustably secured thereto, the arm L, having a bracket at one end, the plummet pivoted to said bracket, and the bolt passing through said bracket and one of the end sections to adjustably secure the arm to said section, as set forth.

418,931. HAME-FASTENER. ALFRED FELLOWS, Lansing, Kans., assignor of one-half to Frank M. Gable, same place. Filed Apr. 10, 1889. Serial No. 307,759. (No model.)

Claim.—In a hame-fastener, the combination, with the casing provided with a hook at one end designed to be secured to one of a pair of hames and having parallel sides *a*, provided with a series of adjusting-holes, the lever pivoted intermediate of its ends between the sides *a* and having a curved end a^2, and the adjusting-screw, of the metal strap designed to have one end connected to the other hame and having its other end curved to engage the curved end of the lever, substantially as described.

418,932. RAILWAY TIME-SIGNAL. BOOMER FONTAINE, Auburndale, Ohio. Filed Dec. 10, 1888. Serial No. 293,095. (No model.)

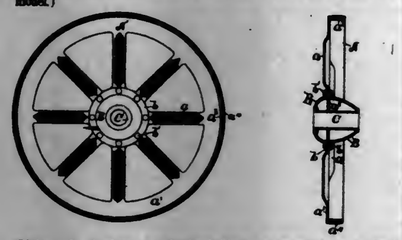
Claim.—1. A railway time-signal of the kind described, comprising an air-compressing device operated by a passing train, an air-receiving chamber communicating therewith and provided with a rising and falling diaphragm, a signal-dial mounted on the post, actuating clock mechanism for operating the index-hand of said dial, a clutch in the actuating-shaft of the clock mechanism controlled by the rising and falling diaphragm of the air-receiving chamber to engage and disengage said clutch, and a retracting-weight or its equivalent for the index-hand, substantially as described.

2. In a time-signal, the combination, with an air-compressing device and its actuating-lever operated by a passing train, of a signal-dial mounted on a hollow post, actuating clock mechanism mounted in the base of said post, a shaft operated by said clock mechanism and provided with an extension into the top of the post and operating the index-hand of the dial, an intermediate clutch mechanism consisting of the notched disk revolving with the shaft of the clock mechanism, and the hinged dog on the extension of said shaft, a rising and falling guide-rail on which said dog is adapted to travel, an air-receiving chamber provided with a rising and falling diaphragm, and an actuating-connection of said diaphragm with the rising and falling guide-rail, substantially as described.

3. The combination, with the hollow signal-post, of the clock mechanism mounted in the base thereof, and with the actuating-shaft in line with the axis of the post, a stop formed on the upper end of said shaft, an extension of said shaft into the top of the post and supported on said stop, the clutch mechanism between said shaft and its extension, the beveled pinion secured to the upper end of said shaft-extension, the transverse shaft carrying the beveled pinions engaging with the beveled pinion on the extension of the shaft, the index-hands secured to said transverse shaft, and the dials mounted on top of the post, substantially as described.

4. The combination, with the lever E, operated by a passing train to control the time-signal, of the box B, inclosing such lever and provided with an aperture through which the inner end of said lever projects into proximity to the rail, and the rail-clip C, securing the inner end of such box to the rail, substantially as described.

5. The combination, with the lever operated by a passing train to control the time-signal, of the box B, inclosing such lever, the rail-clip C, securing the box to the rail, the piston F, carried by the free end of the lever, and the air-cylinder G, secured in an aperture of the box, substantially as described.



6. The combination, with the shaft O of the actuating clock mechanism of the signal, of the notched disk P, secured thereto, the stop Q, formed thereon, the shaft-extension R, supported thereon, the hinged dog S, adapted to engage with the notched disk P, the fixed zero-stop *p*, the fixed disengaging-stop *o*, and the back stop *r*, substantially as described.

7. The combination, with the shaft O of the clock mechanism of the signal, of the notched disk P, revolving therewith, the stop Q, formed on said shaft, the shaft-extension R, supported thereon and operating the index-hand of the signal-dial, the hinged dog S, adapted to engage with the notched disk, the rising and falling guide-rail U, the fixed zero-stop *p*, and the weight *l* and its connection with the shaft R, to retract the index-hand, substantially as described.

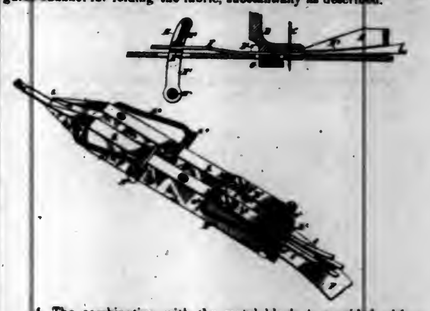
8. The combination of the shaft O of the clock mechanism of the signal, the notched disk P, revolving therewith, the stop Q, formed on said shaft, the shaft-extension R, supported thereon and operating the index-hand of the signal-dial, the hinged dog S, adapted to engage with the notched disk, the rising and falling guide-rail U, the fixed zero-stop *p*, the fixed disengaging-stop *o*, the back stop *r*, and the weight *l* and its connection with the shaft R, to retract the index-hand, substantially as described.

9. The combination, with the shaft O of the actuating clock mechanism of the signal, of the notched disk P, secured thereto, the shaft-extension R, adapted to revolve independently of the shaft of the clock mechanism, the dog S, secured to said shaft and adapted to engage with the notched disk, the rising and falling guide-rail U, on which said dog is adapted to travel, the vertical frame V, carrying said guide-rail, the air-receiving chamber W, the rising and falling diaphragm Y, and the lever Z, bearing upon the center of said diaphragm and operating the frame V, substantially as described.

413,933. METALLIC WHEEL. ROSS FOSTER and JACOB HOWARD, Cleveland, Ohio, assignors to the Avery Stamping Company, same place. Filed Feb. 29, 1888. Renewed Apr. 22, 1889. Serial No. 308,235. (No model.)

Claim.—1. A sheet-metal-wheel blank stamped from a single piece of metal, consisting of the following integral parts, to wit: a hub a^3, spokes *a a*, rim *a'*, and turned-over annular flange a^2 said spokes being bent longitudinally, every alternate spoke in one direction and the intermediate spokes in the opposite direction, substantially as and for the purpose specified.

2. A sheet-metal wheel consisting of a hub a^3, spokes *a a*, rim *a'*, and turned-over annular flange a^2, all stamped from a single piece of sheet metal, combined with sheet-metal hub-pieces riveted thereto, substantially as and for the purpose specified.



3. A sheet-metal-wheel blank and the hub-pieces B B, secured thereto, combined with a pipe C, passed through said blank and hub-pieces and secured in place by having its ends upset, substantially as and for the purpose specified.

413,934. SEWING-MACHINE ATTACHMENT FOR MAKING DRESS-STIFFENING. MARSHALL GARDNER and JAMES STONE, Aurora, Ill., assignors, by mesne assignments, of two-thirds to Alice M. Ball, same place, and Elizabeth Florabaum, Chicago, Ill. Filed July 8, 1887. Serial No. 243,735. (Model.)

Claim.—1. In an apparatus for making stiffening of the character described, and in combination, a block having a channel for guiding the fabric, a block within said channel having passages therein to guide the stiffening-filaments side by side, and pressers for folding the fabric, substantially as described.

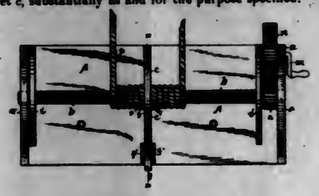
2. A sewing-machine attachment for the purpose set forth, consisting of a metal block having a channel therein formed with converging walls for the passage of the fabric, guides for the stiffening-filaments within said channel, a guide-passage having parallel side walls for the passage of the fabric, and stiffeners and pressers within said guide-passage, substantially as described.

3. A sewing-machine attachment for the purpose set forth, comprising a metal block A, provided with a central guide-channel having converging side walls at its receiving end, a U-shaped block B, fitting the receiving end of said channel and having converging walls, the spaces between the walls of the block B and guide-channel forming a converging guide-passage for the fabric and provided with guides for the stiffening-filaments, and pressers located in the said guide-channel for folding the fabric, substantially as described.

4. The combination, with the metal block A, provided with a guide-channel having converging side walls at its receiving end, of a block of U shape in cross-section fitting the receiving end of said channel and having converging walls, the spaces between the walls of the blocks B and guide-channel forming a converging guide-passage for the fabric, a partition in said block B, forming two guides for the stiffening-filaments, a presser in said block acting upon the said filaments, and pressers for folding the cloth located in the said guide-channel, substantially as described.

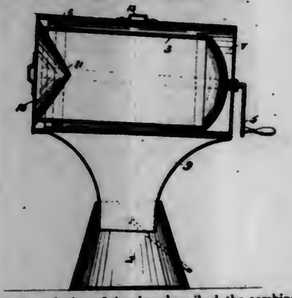
5. The combination, with the metal block A, provided with a guide-channel having converging side walls at its receiving end, of a block B, having converging walls and fitting within the said channel, the spaces between the walls of the block and the walls of the guide-channel forming a converging guide-passage for the fabric, said block having a yielding connection with the block A, guides for the stiffening-filaments, and pressers for folding the fabric, substantially as described.

6. In an apparatus for making dress-stiffenings of the character described, and in combination, a main block having a passage for guiding the fabric, a block within said passage, having channels therein for guiding the stiffening-filaments side by side, said main block being provided with a guide-passage having parallel side walls forming a continuation of the said fabric-guiding passage, adapted to receive the fabric and stiffeners, pressers within said fabric-guiding passage for folding the fabric upon the stiffeners, shafts passing through the block, each having a presser attached thereto, said shafts being also provided with arms, and the main block being provided with recesses which are entered by said arms, whereby the pressers are held in operative position, substantially as described.



7. The combination, with the stitch-forming mechanism of a sewing-machine, guides for stiffening-filaments, and pressers for folding a fabric about said filaments, of a feed device for the stiffening, consisting of a vibrating frame having opposing clamp-jaws acting to engage and move forward the stiffening when the frame is moving in one direction, substantially as described.

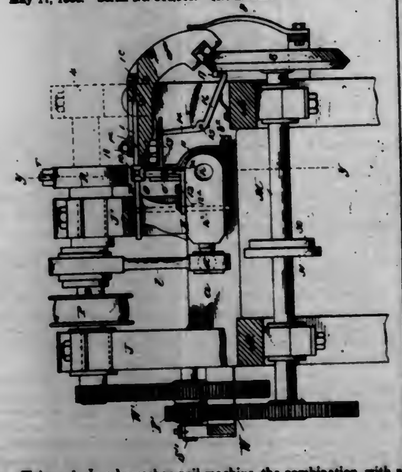
8. The combination, with the stitch-forming devices of a sewing-machine and a presser-foot thereof, of guides for stiffening-filaments, pressers for folding a fabric about the said filaments, stationary guides, as blocks D' D', located at opposite sides of the presser-foot and supported upon the bed-plate of the machine, and feed devices for carrying the stiffening beneath the presser-foot, substantially as described.



9. An apparatus for making stiffening of the character set forth, consisting of a metal block A, having a guiding-channel for the fabric, said channel having its walls parallel throughout the greater portion of its length, but having convergent walls at the receiving end, a block, as B, fitting said channel at its receiving end and provided with converging walls, said block having guides formed therein for the passage of the stiffening material, springs for holding said block B upon the fabric, and pressers A^9 A^9, arranged in the guiding-channel for the fabric, substantially as described.

413,935. AWNING-REEL. HENRY M. RAUBERT, Hot Springs, Ark. Filed June 12, 1888. Serial No. 313,864. (No model.)

Claim.—In an awning-reel, the combination of the frame-plate A, having end flanges *a*, a shaft *b*, pivoted therein, central ratchet-wheel *c*, and gear-wheel *k*, fixed on said shaft, awning-ropes *p p*, secured, as described, to opposite sides of the ratchet *c*, and coiled upon shaft *b*, with the gear-wheel *n*, its pivoted operating-crank *m*, and spring-actuated pawl *g*, pivotally supported from plate A, and held in contact with ratchet *c*, substantially as and for the purpose specified.



413,936. ASH-SIFTER. JOHN HANLEY, Minneapolis, Minn. Filed May 6, 1889. Serial No. 309,673. (No model.)

Claim.—1. In a device of the class described, the combination of the receptacle-case 7, having a cylindrical body, and the funnel-shaped bottom 9, adapted to fit into a suitable receptacle, the cylindrical rotatable sieve 3, having the crank 5 and supported on the rollers 6, and the lid 10, adapted to close the open ends of the case and of the sieve, substantially as described.

2. The combination, with a case having an open end and a bottom portion adapted to fit into a suitable receptacle and to direct material from said case into said receptacle, of a sieve arranged in said case and provided with an open end and a cover adapted to close the open ends of the case and sieve.

413,937. MACHINE FOR MAKING HORSESHOE-NAILS. CHRISTIAN A. HANSEN and OLE C. GULBRANDSEN, Christiania, Norway. Filed May 17, 1889. Serial No. 311,108. (No model.)

Claim.—1. In a horseshoe-nail machine, the combination, with a hammer and a cutter, of an anvil provided with cutting-edges and constructed to co-operate with said hammer in forging a nail and with said cutter in severing the forged nail from a nail-rod, substantially as described.

2. In a horseshoe-nail machine, the combination, with an anvil and a forging-roller co-operating therewith, of an auxiliary anvil, a hammer co-operating therewith, and two cutters arranged on opposite sides of the auxiliary anvil, said anvil being constructed to co-operate with the cutters to sever the forged nail-rod, substantially as described.

3. In a horseshoe-nail machine, the combination, with a hammer and two cutters, of an anvil constructed to co-operate with said hammer in forging a nail and with said cutters in severing the forged nail from a nail-rod, and a nail-rod carrier co-operating with the cutters to carry the forged nail thereto to be cut, substantially as described.

4. In a horseshoe-nail machine, the combination, with a vertical anvil and a forging-roller co-operating therewith, of a horizontal anvil and a hammer co-operating therewith, two cutters arranged on opposite sides of the horizontal anvil, said anvil being constructed to co-operate with the cutters to sever the forged nail from the nail-rod, and a nail-rod carrier having a periodical lateral movement to carry the forged nail to the cutters, substantially as described.

5. In a horseshoe-nail machine, the combination, with the forging devices, of a nail-rod carrier having a vibratory motion between the forging devices, for the purposes specified.

6. In a horseshoe-nail machine, the combination, with a forging-roller and an anvil co-operating therewith, of a nail-rod carrier, a hammer operating to impart a vibratory movement to the carrier, and an anvil co-operating with said hammer, substantially as described.

7. In a horseshoe-nail machine, the combination, with a hammer adapted to reciprocate in a horizontal plane, an anvil adapted to co-operate with said hammer, and two cutters arranged on opposite sides of the anvil, said anvil being adapted to co-operate with the cutters to sever a nail from the rod, of a nail-rod carrier adapted to move to and from the cutters, substantially as and for the purposes specified.

8. In a horseshoe-nail machine, the combination, with the forging devices, the cutters for severing the forged nail from a nail-rod, and the feeding devices, of a reel for the reception of a coil of continuous nail-rod, said reel being adjustable toward and from the feeding devices, substantially as and for the purposes specified.

9. In a horseshoe-nail machine, the combination, with the forging devices, the cutters for severing the forged nail from a nail-rod, and the feeding devices, of a revolubie carrier for the reception of a coil of continuous nail-rod, said carrier having its perimeter constructed and adapted for adjustment, substantially as and for the purposes specified.

10. The combination, in a horseshoe-nail machine, of an elastic or springy nail-rod carrier with an anvil and a hammer adapted to impart motion to the carrier toward the anvil, substantially as and for the purposes specified.

11. The combination, with the hammer H and the tappet 12, secured to the hammer-stock, of the nail-rod carrier 11, provided with the boss or projection 11^a, substantially as and for the purposes specified

12. The combination of an anvil constructed with cutting-edges on its under side and having a periodical vibratory movement with the cutters 9 and 9', arranged on opposite sides of the anvil, substantially as and for the purposes specified.

13. The mechanism for imparting a periodical vibratory movement to the pivoted cutter-anvil 1, consisting in the combination, with said anvil having an extension 2, in which is journaled a roller 5, of the revoluble cone-disk 6, provided with a notch 7, substantially as described.

14. The combination, with the cutters 9 and 9' and the cutter-anvil 1, co-operating therewith, as set forth, to sever a forged nail from a nail-rod, and an elastic or springy nail-rod carrier 11, provided with the slotted arm 13, of the bell-crank lever L, connected with said slotted arm, and the revoluble cone-disk 6, provided with the cam-face 17, adapted to co-operate with the bell-crank lever to impart motion in one direction to the nail-rod guide, substantially as and for the purposes specified.

15. The combination, with the feeding and forging devices of a horseshoe-nail machine, of the furnace *f*, constructed with the tapering projection *f'*, the combustion-chamber 69, the fire-bridge 66, the flue 70, and the fuel-magazine 63, arranged substantially as described, and for the purposes specified.

16. The combination, with the furnace for heating the nail-rod, said furnace having a transverse slot for the exit of said nail-rod, of a vibratory nail-rod carrier and a shield or guard-plate 73, applied over said slot and having an aperture for the passage of the nail-rod, said shield being connected to and vibrating with the nail-rod carrier, substantially as and for the purposes specified.

17. The nail-rod-feeding devices consisting of a clamp having a periodical reciprocating movement and a push-rod to open the jaws of the clamp just prior to and during said vibratory motion, in combination with an auxiliary stationary clamp having its jaws normally

open and a push-rod operating to close said jaws and maintain the same closed as soon as the reciprocating clamp commences to move and during its motion in one direction, substantially as and for the purposes specified.

18. The combination, with the cam-disk 31, the connected rock-shafts I and F, the radial arm 32 on rock-shaft I, the radial arm 24 on rock-shaft E, and the spring-actuated dog 20, co-operating with the upper end of the arm 24 to clamp the nail-rod, of the rock-shaft F, the lever or arm 28, and the push-rod 27, connecting the lever with the spring-dog, substantially as and for the purposes specified.

19. The combination, with the cam-disk 31, the rock-shaft I, its radial arms 32 33, the rock-shaft F, its radial arms 24 25, a connection between the latter, and a connection between the radial arm 25 and the radial arm 33, the spring 22, and the dog 20, carried by said spring, of the rock-shaft E, the lever 28 thereon, and the push-rod 27, connecting said lever with the spring 22, substantially as and for the purposes specified.

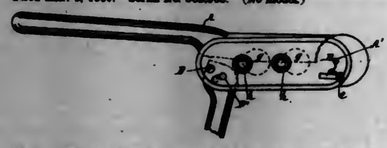
20. The combination, with the standard 51, the spring actuating lever 42, and the locking-dog 40, of the cam-disk 30, the rock-shaft E, and its levers 29 and 49, and the push-rod 46, connecting the lever 49 with the lever 42, substantially as and for the purposes specified.

21. The combination, with the standard 51, the spring-actuated lever 42, having its rear end slotted and curved upwardly, and the dog 40, secured to said lever and arranged relatively to the standard 51, as described, of the rod 46, extending through the slotted end of the lever and having the shoulders 48 and 48^a, and the lever 49 on rock-shaft E, substantially as and for the purposes specified.

22. The combination, with the spring 22, carrying the dog 20, the push-rod 27, the rock-shaft E, and the levers 28 and 29, of the hand-lever 54 and the cam 54^a, substantially as and for the purposes specified.

23. The combination, with nail making and cutting devices of a horseshoe-nail machine, of a reel provided with radial forked bearings for the reception of a coil of continuous nail rod or wire, one side of said forked bearings being detachable, substantially as and for the purposes specified.

418,938. SOLDER-MELTING FURNACE. ELISHA HAWES, Sacramento City, Cal. Filed Oct. 28, 1887. Serial No. 253,662. (No model.)

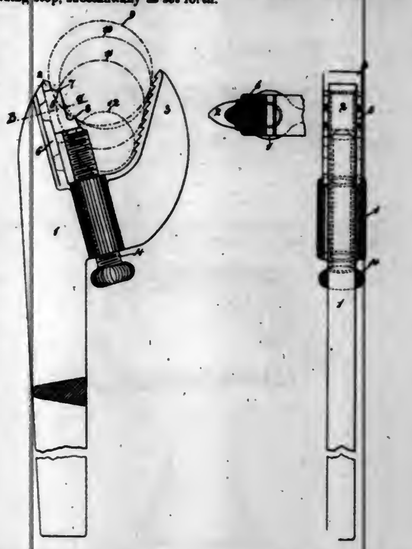


Claim.—1. The furnace having the doors E at one side, the bottom formed of inclined step-like strips F, with transverse supporting-bars G between them, whereby air-spaces H are formed between the strips, the trough I at the lower side of the bottom, and the pyramidal roof B, having the smoke-flue C and the doors D, substantially as described.

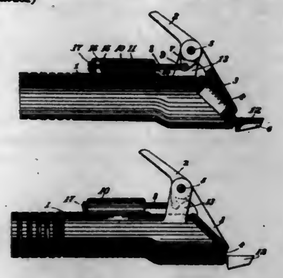
2. The furnace having the doors E on one side, the doors D in its top, the escape-flue, the bottom formed of a series of inclined step-like strips with air-spaces between them, and the trough at the lower side of the bottom, substantially as described

---

418,939. BULLET-MOLD. WILLIS W. HARRIS, Sioux City, Iowa. Filed Mar. 8, 1889. Serial No. 302,583. (No model.)



Claim.—The combination, substantially as shown and described, of the bullet-mold made in halves hinged together at one end, the plate B, pivotally secured to the handle C, the latter hinged to one half of the mold, the inlet holes or perforations A *h*, with cutting-edges, made in the said plate B, and the elongated slot *d*, engaging with the guide-stud *e*, secured to one half of the mold, as and for the purpose specified.



418,940. PIPE-WRENCH. JOHN T. HAWKINS, Taunton, Mass. Filed Apr. 26, 1889. Serial No. 309,037. (No model.)

Claim.—1. In a pipe-wrench constructed of a serrated or toothed jaw, as 3, and an opposite smooth or unserrated jaw, as 2, the combination of a stop for the pipe sliding upon the smooth jaw and an adjusting-screw for regulating the position of said sliding stop, substantially as set forth.

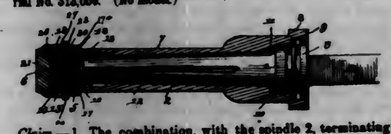
2. In a pipe-wrench constructed of a serrated or toothed jaw, as 3, and an opposite smooth or unserrated jaw, as 2, in combination with a stop, as 5, sliding upon the smooth jaw and having formed thereon tooth-edges, an adjusting-screw, as 4, for regulating the position of said sliding stop, substantially as set forth.

418,941. VALVE FOR PNEUMATIC PIPES OR TUBES. JOHN T. HAWKINS, Taunton, Mass. Filed Apr. 29, 1889. Serial No. 308,983. (No model.)

Claim.—In combination with a valve externally pivoted upon a pipe or coupling, a helical spring inclosed within a tube or case formed upon or attached to the body of said pipe or coupling and suitably connected to an arm formed upon the valve-lever, whereby the valve is automatically closed by the action of said spring and the spring protected from dust, dirt, or other matters liable to cause wear and deterioration of said spring, substantially as set forth.

418,942. MEANS OF ACCESS TO A NUMBER OF SURFACE, ELEVATED, OR UNDERGROUND RAILWAYS. ROWLAND B. HAZARD, New York, N. Y. Filed Apr. 2, 1887. Serial No. 233,371. (No model.)

Claim.—1. In underground-railway stations, the combination of four adjacent tracks, of which the two outer ones are arranged in different vertical and horizontal planes from the two inner ones, with platforms adjacent to each track, substantially as described.



2. An underground-railway station having tracks on different planes, the outer track being depressed below the inner, and a landing for the inner track extending over the outer one, and a second landing adjacent to the latter, substantially as shown and described.

3. In underground railways having tunnels arranged close together, a double-platform station with tracks on different planes, the inner tracks having an adjacent platform which extends over the outer tracks, substantially as described.

418,942.

418,943. AXLE. PATRICK K. HOOBER, Wilkes-Barre, Pa., assignor of one-half to William J. Parmelee, same place. Filed June 4, 1889. Serial No. 313,050. (No model.)

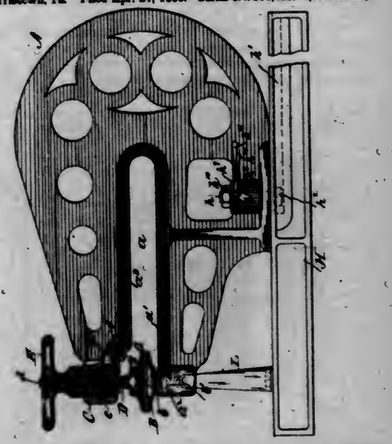
Claim.—1. The combination, with the spindle 2, terminating in the reduced portions 5 and 6, oppositely screw-threaded, of the sleeve or axle-box 7, projecting slightly beyond the beginning of the reduced portion and terminating in the annular groove 13, having the washer 14, the binding-nut 15, threaded on the portion 5 and having a reduced rear portion forming a ground joint with the recess 13, and having a forward annular recess 19, and of the lock-nut 21, having the internal bore provided with the interiorly-threaded integral collar 26, mounted on the reduced portion 6, the exterior of said collar taking within the annular recess 19 of the nut 15 and forming a ground joint with the wall of the same, said lock-nut having the hollow cap portion 22, which is of a length sufficient to wholly receive the nut 15 and fit around the end of the axle-box, substantially as specified.

2. The spindle having the oppositely-threaded portions 5 and 6 at the outer end, combined with the nut 15, screwing over the threaded portion 5, and the cap or set-nut 21, screwing upon the threaded portion 6 and inclosing the nut 15 and the end of the axle-box, as set forth.

3. The spindle having the oppositely-threaded portions 5 and 6 at the outer end and the axle-box on the spindle, combined with the nut 15, screwing over the portion 5 and forming a ground joint with the interior surface of the outer end of the axle-box, and the cap or set-nut 21, having the threaded collar 26, screwing upon the portion 6 of the spindle and inclosing both the nut 15 and the end of the axle-box, as set forth.

4. The spindle having the threaded portion 6, combined with the cap-nut 21, having an interior screw-threaded collar 26 to engage with the threaded portion 6 of the spindle, said cap-nut being extended forward and inclosing the end of the axle-box, as set forth.

418,944. YEAST-CAKE. WOLCOTT A. HULL, New York, N. Y. Filed July 6, 1889. Serial No. 316,714. (No specimens.)



Claim.—1. A yeast-cake having its exterior surface free from sharp angles, substantially as set forth.

2. A yeast-cake having a thin exterior surface-crust formed of the cake material, the exterior surface of said crust being rounded throughout and free from sharp angles, substantially as set forth.

3. A yeast-cake the exterior surface of which is adapted to receive an envelope or coating, being of rounded form throughout and free from sharp angles, substantially as set forth.

418,945. DEVICE FOR CLAMPING PLATES OR SHEETS OF METAL. CHARLES L. HUSTON, Contesville, assignor to John D. Newbold, Norristown, Pa. Filed Apr. 27, 1889. Serial No. 308,792. (No model.)

Claim.—1. The combination, with a pivotally-supported holding device A, of a stop-bar L, having an adjusting-screw *l*, substantially as set forth.

2. The combination, with a pivotally-supported holding device A, of a stop-bar L and eccentric sleeve A^1, substantially as set forth.

3. The combination, with holding device A and its bed-plate, of a pivotal connection between said parts and an eccentric sleeve with operating-handle within said pivotal connection, substantially as set forth.

4. The combination, with a holding device A, having a swinging movement on a pivotal support, of mechanism for initially moving the device A longitudinally and separate mechanism for terminally adjusting the device A longitudinally, substantially as set forth.

5. The combination, with a holding device A, having sleeve-bear-

ing A^9, of a bed-plate, bolt-connection A, sleeve A^8, and eccentric sleeve A^7, having handle A^{11} and locking mechanism, substantially as set forth.

6. The combination of a holding device A, having a swinging motion on a pivotal support, stop-bar therefor, mechanism for initially longitudinally moving said device, and separate mechanism for completing such longitudinal movement, substantially as set forth.

7. The combination of a yoke-frame A, the head or disk B, vertically-sliding screw D, rotating tubular sleeve or bushing C, engaging with said screw and having hand-wheel E, and disk or head G at the lower end of screw D, substantially as set forth.

8. The combination of yoke-frame *a*, tubular sleeve or bushing C, threaded in its bore and having hand-wheel E, the vertically-sliding screw D, engaging with sleeve C, head or disk G, and ball-and-socket connection between disk G and screw D, substantially as set forth.

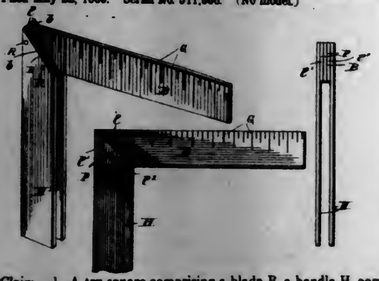
9. The combination of yoke-frame *a*, rotating disk B, tubular sleeve C, threaded in its bore and having hand-wheel E, screw D, engaging with sleeve C and having longitudinal slots *d*, plate F, having studs *f*, engaging with screw-slots *d*, and head or disk G at the lower end of screw D, substantially as set forth.

10. In a holding device A, the disk G, having supplementary biting-surfaces, substantially as set forth.

11. In a sheet-metal holding device A, the rocking clamping disk or head G, provided with supplementary biting-surfaces, substantially as set forth.

12. In a sheet-metal holding device A, clamping disks or heads, supplementary biting surface or surfaces on said disks, and actuating pressure-screw, substantially as set forth.

13. In combination with the rotatable sheet-metal holding device A, the stop-bar L, substantially as set forth.



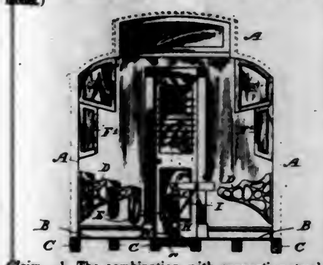
14. In combination with the rotatable sheet-metal holding device, a bed-plate and mechanism interposed between the bed-plate and holding device for sliding the latter upon the former, substantially as set forth.

15. In combination with the sheet-metal holding device A, the bottom piece I, bed-plate H, and mechanism interposed between bottom piece I and bed-plate H for sliding the bottom piece on the bed-plate, substantially as set forth.

16. The combination of sheet-metal holding device A, bottom piece I, pivotal connection between holding device A and bottom piece I, shaft i^3, having gear-wheel i^3, mounted on bottom piece I, and bed-plate H, having rack A^{21}, engaging with wheel i^3, substantially as set forth.

17. The combination of bed-plate H, bottom piece I, holding device pivoted to bottom piece I, stop-bar L on the latter, and mechanism interposed between the bed-plate H and bottom piece I for sliding the latter on the former, substantially as set forth.

413,946. TRY-SQUARE. DANIEL H. ISENHOWER, Bloomington, Ill. Filed May 22, 1889. Serial No. 311,666. (No model.)



Claim.—1. A try-square comprising a blade B, a handle H, composed of two members, one on either side of the blade, pieces P between the ends of said members and of the blades, the ends *b* of said members and one side *p* of said pieces being beveled, as shown, for the purpose set forth.

2. A try-square comprising a blade B, a handle H, composed of two members, one on either side of the blade, pieces P between the ends of said members and of the blades, the ends *b* of said members and one side *p* of said pieces being beveled, as shown, and the lower faces of said pieces being flush with the lower edge of the blade, substantially as set forth.

3. A try-square comprising a blade B, a handle H, composed of two members, one on either side of the blade, pieces P between the ends of said members, the ends *b* of said members and one side *p* of said pieces being beveled, as shown, and the lower faces of said pieces being flush with the lower edge of the blade, said members below the lower edge of said blade being spaced a distance equal to the thickness of two clapboards at their lapping edges, whereby said handle will retain a loose clapboard in place, as herein specified.

413,947. REVERSIBLE MAIL-ASSORTING TABLE. CHARLES A. KENDALL, Concord, N. H. Filed Oct. 25, 1888. Serial No. 289,126. (No model.)

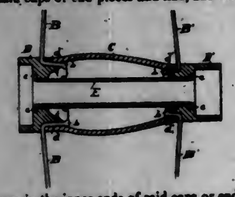
Claim.—1. The combination, with supporting-standards having angle-irons secured to their top, the vertical portion of which contains a single perforation, of a reversible table having rims on both sides and all around, plates secured to each end of said table and provided with studs for entering the perforation of said angle-iron, and brace-rods having one end pivoted to either end of said table and the other end capable of vertical movement upon said supporting-standards.

2. The combination of supporting-standards provided with angle cap-irons having in their vertical portions a single perforation, a reversible table having rims on both sides and all around hinged at either end near one side to said angle cap-irons, brace-rods having one end pivoted to either end of said table and the opposite end connected to either supporting-standard and capable of vertical movement thereon, and means for securing said brace-rods and reversible table in a vertical position, for the purpose set forth.

3. The combination of supporting-standards provided with angle cap-irons having in their vertical portions a single perforation, one or more bars running horizontally between said standards, having adjustable mail-bag hooks mounted thereon, a reversible table hinged to said angle cap-irons, and brace-rods connecting said table with said standards in a manner whereby the said table may be securely adjusted to a vertical position and to a horizontal position at either side of said standards, substantially in the manner specified.

413,948. CORNER-FASTENING FOR CRATES. ALBERT T. LIEBERMAN, Whitehall, Mich. Filed Apr. 17, 1889. Serial No. 307,345. (No model.)

Claim.—1. A triangular-shaped fastener for the corners of crates or boxes, the two ends of which fastener are drawn to and fastened at one of the angles of the triangular-shaped fastener, substantially as and for the purposes set forth.



2. A triangular-shaped wire fastener for the corners of crates or boxes, the two ends of which fastener are drawn to and fastened at one of the angles of the triangular-shaped fastener and their points driven into the wood of the crate-frame, substantially as set forth.

3. The combination, with an angle-wood crate-frame provided at the corners with grooves or recesses to receive it, of the triangular-shaped fastener fastened at one of the corners of the crate-frame at or near the groove or recess therein, whereby the tightening or closing of the fastener draws and holds the other two angle-woods to the one where the tightening or closing of the fastener takes place, substantially as described.

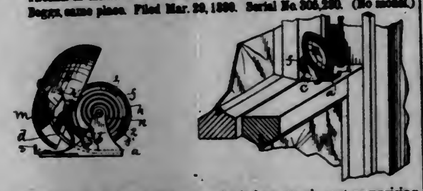
4. The combination, with a triangular fastening for angle-wood crate-frames, the ends of which fastener are fastened at one of its angles, of a chamfered-off recess upon the corner of the angle-wood, whereby contact with the ends of the fastener and outside objects is prevented, substantially as shown.

413,949. METALLIC WHEEL. CHARLES E. MARX, Flint, Mich., assignor to the Marx Metal Wheel Company, same place. Filed Mar. 2, 1889. Serial No. 301,770. (No model.)

Claim.—In a metallic wheel, the combination, with the hub and caps or end pieces adapted to enter the ends of said hub, of spokes engaged between said caps or end pieces and hub, and having headed

ends lying in recesses in the inner ends of said caps or end pieces, substantially as described.

413,950. LATHE-TOOL. EDWARD R. MARKHAM, Chicopee Falls, Mass., assignor to the J. Stevens Arms and Tool Company, same place. Filed Dec. 22, 1888. Serial No. 294,455. (No model.)



Claim.—1. A cutting-tool consisting of a shank divided into two sections—a body-section and a head-section—swiveled together by being formed the one with a socket and the other with a dowel entering said socket, a cutter carried at all times by the head-section, a fastening for adjustably clamping the cutter thereto irrespective of whether the head-section is secured to the body-section or not, and an independent fastening for clamping the head-section to the body-section after the adjustment of its swivel-joint, said latter fastening between the head and body sections being independent of the fastening between the cutter and the head-section, whereby the cutting-edge may be adjusted to different angles without disturbing the union between the cutter and the head-section, substantially as set forth.

2. The body-section of a cutting-tool, the head-section thereof, a swivel-connection between said head and body sections, whereby said head-section is axially adjustable on said body-section, and a fastening for clamping said sections in the required relative position, in combination with a cutter carried by said head-section and rotatively adjustable thereon, and a fastening for clamping said cutter in the required position on said head-section, said fastening being wholly independent of the fastening between the head and body sections, substantially as set forth.

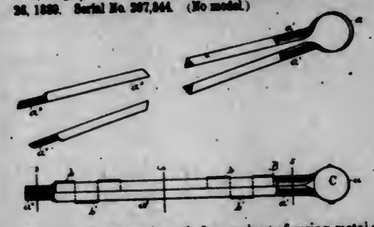
3. The body-section of a cutting-tool having a socket, a head-section having a dowel entering and capable of turning axially in said socket, and a set-screw for securing said body-section and head-section in the required position, in combination with a cutter carried by said head-section, and a stud securing said cutter to said head-section irrespective of the connection between the head-section and the body-section, on which stud said cutter is rotatively adjustable, substantially as set forth.

4. A cutting-tool consisting of a shank divided into two sections, a body and head section, the body-section formed with a longitudinal socket and an intersecting transverse socket, and the head-section provided with a dowel adapted to fit either of said sockets, and a set-screw screwing into the body-section at the point of intersection of said sockets, whereby the head-section may be swiveled to the body-section on either a longitudinal or transverse axis, and may be fastened in either case by said set-screw.

413,951. BURGLAR-ALARM ATTACHMENT FOR WINDOWS. THOMAS H. MARTIN, Des Moines, Iowa, assignor of one-half to George C. Bogen, same place. Filed Mar. 30, 1889. Serial No. 305,280. (No model.)

Claim.—1. A burglar-alarm and window attachment comprising a base *a*, having posts *b* and *c* at its sides, a roller having a series of catches 1 2 3 4 in bearings at the tops of said posts, a curved post *d* between said posts, a bell fixed to the curved post, a striker *w*, having a spring-stem *s* fixed to one of the side posts, and a lever *e*, pivoted on top of the base, constructed and combined to operate in the manner set forth.

2. The base *a*, having fixed posts *b* and *c* at its sides, the roller *f*, having a series of catches on its side face in bearings at the tops of said posts, a curved post *d* between the posts *b* and *c*, a bell fixed to the said curved post, a striker having a spring-stem fixed to one of the side posts, and an elbow-shaped lever pivoted on top of the base, constructed and combined and attached to the top of the window-sash to operate in the manner set forth, for the purposes stated.



413,952. CURTAIN-PIN. FANNIE A. MATHEWS, New York, N. Y. Filed June 7, 1888. Serial No. 313,494. (No model.)

Claim.—1. As an article of manufacture, a curtain hook and pin made of a single piece of wire having the hook D and shank C, of two strands, one of said strands being extended laterally near the end of the shank to form a catch for the hook D, substantially as described.

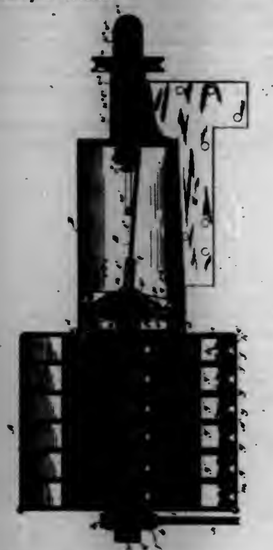
2. As an article of manufacture, a curtain hook and pin made of a single piece of wire having the hook D and shank C, of two strands, one of which is extended laterally near the end of the shank to form a catch for the hook D, the said strands branching in opposite directions at the end of the shank and being formed with a spring-pin and a catch therefor, substantially as described.

413,953. SHEET-METAL ROD, &c. FRANK. MILLER, Cleveland, Ohio, assignor to the Avery Stamping Company, same place. Filed Jan. 26, 1889. Serial No. 297,844. (No model.)

Claim.—1. A rod or pin made from a sheet of spring metal somewhat more than twice the desired length of the rod or pin, having the legs on each side of the central part bent longitudinally into any desired form, and having the said central part bent transversely, whereby the two legs may be brought together and whereby the spring of the bent central part tends to spread the legs apart and thereby automatically hold them in engagement with a part of which surrounds them, substantially as and for the purpose specified.

2. A pivot-rod for dampers, &c., consisting of a strip of spring sheet metal bent transversely near its middle to bring the two legs thereof together, said legs being bent longitudinally into such shape that when they lie together they form the angular part a^2 and the cylindrical parts a' a^3, substantially as and for the purpose specified.

3. The combination, with a plate B, having the retaining-straps *b b'*, of a spring pivoting-rod made of a strip of sheet metal bent transversely near its middle to bring the two legs thereof together and bent longitudinally, so that when said legs are brought together they will form an angular part for engagement with the straps *b b'* and cylindrical parts upon which it turns, substantially as and for the purpose specified.



4. A pivot-rod for dampers, &c., consisting of a strip of sheet metal bent transversely near the middle to bring the two legs thereof together, said legs being bent longitudinally into such shape that when brought together they form the angular part a^2, the cylindrical part a', and the cylindrical part a^3 at the ends, of smaller diameter than a', substantially as and for the purpose specified.

413,954. SPRING-MOTOR. JAMES T. MILLER, Atlanta, Ga. Filed Oct. 12, 1888. Serial No. 287,895. (No model.)

Claim.—1. In a spring-motor, a series of coiled springs arranged side by side and all connected together, in combination with the rotating gear-wheel *o*, the rocking gear-wheel *p*, the connecting-rod l^2, and the pulley or band wheel, substantially as herein set forth.

2. In a spring-motor, a series of coiled springs arranged side by side and all connected together, in combination with the main driving-

shaft *c*, formed with a ball *n* thereon, rotating gear-wheel mounted on said shaft, a rocking gear-wheel loosely mounted on said ball, the rod t^3, connected to said rocking gear-wheel, and the pulley or band wheel, substantially as set forth.

3. The combination of the operating-springs, the main driving-shaft *c*, deriving power therefrom, rotating gear-wheel rigidly mounted on said shaft, having the ball *n* formed on the end of said shaft, the rocking gear-wheel *p*, loosely mounted on said ball, the yoke D, embracing said rocking gear-wheel, for the purpose set forth, the connecting-rod t^3, and the pulley-wheel, all combined and arranged substantially as set described.

4. The combination of the operating-springs, the sleeve *j*, connected thereto, the hub or nut *k*, fitting loosely within said sleeve and provided with inclined tracks *l' l' l'*, the balls *l l l*, mounted on such inclines, the main driving-shaft rigidly connected to said hub or nut, the rotating gear-wheel mounted on said main shaft, having the ball *n* formed on the end of said shaft, the rocking gear-wheel loosely mounted on said ball, the yoke D, encircling said rocking gear-wheel, the connecting-rod t^3, and the pulley or band wheel, substantially as set forth.

5. The combination of the operating-springs, the main driving-shaft connected therewith, rotating gear-wheel mounted on said shaft, having the ball *n* formed on the extreme end of said shaft, the rocking gear-wheel *p*, mounted loosely on said ball, the rod t^3, connecting said rocking gear with the fly-wheel *v*, the face-wheel *u*, the shaft *u'*, and pulley or band wheel mounted on the same, substantially as set forth.

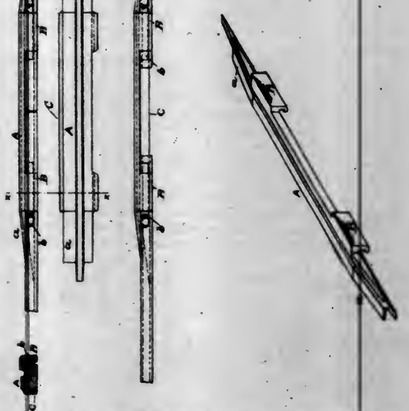
6. The combination of the operating-springs, the main driving-shaft connected therewith, the rotating gear mounted on said shaft, having the ball *n* formed on the extreme end of said shaft, the rocking gear *p*, loosely mounted on said shaft, the connecting-rod t^3, the face-wheel *u*, mounted on the shaft *u'*, the rod v^3 within said shaft, and the pulley or band wheel mounted on said shaft, substantially as set forth.

7. The combination of the operating-springs, the main driving-shaft connected therewith, the rotating gear-wheel mounted on said shaft, having the ball formed on the extreme end of said shaft, the rocking gear-wheel loosely mounted on said ball, the rod t^3, the face-wheel *u*, the shaft *u'*, the rod v^3 within the same, and the governor-weights acting with said rod, for the purposes set forth, substantially as described.

8. The combination of the operating-springs, the main driving-shaft connected therewith, the rotating gear-wheel mounted on said shaft, having the ball *n* formed on the end of the same, the rocking gear-wheel *p*, mounted loosely on said ball, the connecting-rod t^3, the face-wheel *u*, mounted on the shaft *u'*, the rod v^3 within said shaft, the governor-weights pivotally attached to said face-wheel, coiled springs encircling said rod v^3, for the purposes set forth, and the pulley-wheel mounted on said shaft *u'*, substantially as herein described.

9. The combination of the operating-springs, the main driving-shaft connected therewith, the rotating gear-wheel mounted on said shaft, having the ball *n* formed on the end of the same, the rocking gear-wheel *p*, mounted loosely on said ball, the connecting-rod t^3, the face-wheel *u*, mounted on the shaft *u'*, the rod v^3 within said shaft, the governor-weights pivotally attached to said face-wheel, coiled springs encircling said rod v^3, for the purposes set forth, the pulley or band wheel mounted on said shaft *u'*, and the thumb-nut on the extreme end of the rod v^3, substantially as described.

10. In a spring-motor, the combination, with a gear-wheel *o*, rotated by means of springs, of a gear-wheel *p*, provided with a different number of teeth from the gear-wheel *o*, oscillatingly mounted on a ball and held from rotation by means of a yoke, substantially as set forth.



413,955. TRIMMING FOR THE EDGES OF FABRICS. JOSEPH B. MORLEY, Philadelphia, Pa., assignor to himself, Robert W. Scott, and Louis H. D. Williams, all of same place. Filed Aug. 12, 1889. Serial No. 320,473. (No specimens.)

Claim.—1. The within-described trimming or border for fabrics, the same consisting of a row of stitches on the fabric, a row of stitches some distance beyond the edge of the fabric, and two rows of loops or festoons, one row being confined to the fabric by the row of stitches thereon and the other row being incorporated with the outer row of stitches, said rows of loops or festoons being intermeshed at a point between the two lines of stitches, substantially as specified.

2. The within described trimming or border for fabrics, the same consisting of a row of stitches formed on the fabric, a row of stitches some distance beyond the edge of the fabric, two rows of intermeshed loops or festoons, one row confined to the fabric by the stitches thereon and the other row incorporated with the outer line of stitches, and a thread incorporated with the outer line of stitches only and forming loops or festoons beyond the same, substantially as specified.

413,956. ADJUSTABLE CLAMP-JOINT FOR RAILROAD-RAILS. ARTHUR J. MOXHAM, Johnstown, Pa. Filed Aug. 16, 1889. Serial No. 320,953. (No model.)

Claim.—1. A joint clamp-plate for railroad-rails, provided with a side lug to clamp each rail.

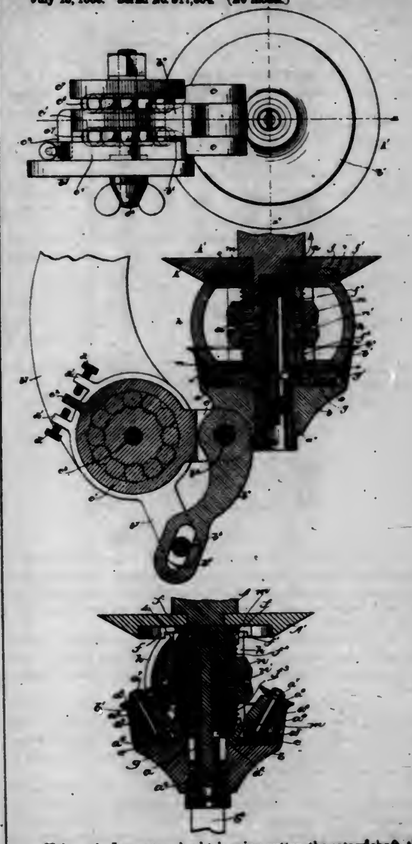
2. A joint clamp-plate for railroad-rails, provided with a side lug at each end thereof secured to the rails by side keys.

413,957. MONEY-CHANGE GAME. JAMES MCCARRELL, St. Petersburg, Fla. Filed July 27, 1889. Serial No. 318,999. (No model.)

Claim.—The game of money-change herein shown and described, comprising the following elements: a series of checks or jettons of varying size and denominations, the slotted box adapted for shuffling and dealing the same, and the removable partitioned frame, constructed and combined to co-operate substantially in the manner and for the purpose set forth.

413,958. STATION-INDICATOR. JOHN F. O'BRIEN, Quebec, Quebec, assignor to George H. Patterson and John W. Allison, both of Montreal, Canada. Filed Apr. 11, 1889. Serial No. 306,816. (No model.) Patented in Canada Feb. 20, 1889, No. 30,836.

Claim.—1. In a station-indicator, the combination, with a series of cards arranged in consecutive order and loosely bound together at one edge and having non-registering notches in the opposite edge, of a revolving wheel having teeth projecting down in front of said cards, for retaining and releasing the cards successively, and mechanism for operating said wheel, substantially as set forth.



2. The combination, with a series of cards having non-registering notches in their upper edges, of a wheel revolving by a step-by-step movement and having teeth which register at one step with the notch in one card and at the next step with the notch in the next card, and mechanism for operating said wheel, substantially as and for the purpose set forth.

3. In a station-indicator, the combination of an open-fronted frame, a series of cards bound together mounted therein with their free edges uppermost, and a wheel for retaining such cards in an elevated position and also for releasing them consecutively and permitting them to fall and display their backs, and mechanism, substantially as described, for giving a step-by-step motion to the wheel, substantially as set forth.

4. The combination, with the frame A, of the case carrying the wheel *d* and mechanism for operating the latter, and notched cards mounted on staples in the frame A and alternately held and released by said wheel *d*, substantially as set forth.

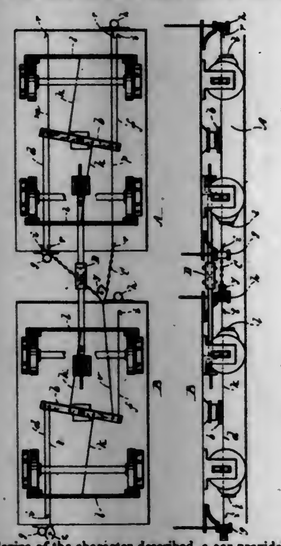
5. In a station-indicator, the combination, with a frame A, carrying the notched cards D, of the toothed wheel *d*, the pivoted lever G, the arm H, connecting one end of said lever to the said toothed wheel, and the lever E, connected to the other end of said lever G, all substantially as and for the purposes set forth.

413,959. HEEL-TRIMMING CUTTER. JEROME I. PACKARD, Boston, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed July 15, 1889. Serial No. 317,604. (No model.)

Claim.—1. In a rotary heel-trimming cutter, the rotary shaft, the rings having lips, the cutter-blades having projections 4 to engage the said lips, and the movable blocks to engage the said projections, combined with means to slide the said blocks radially and to hold them, substantially as described.

2. In a rotary heel-trimming cutter, the rotary shaft, the rings having lips, the cutter-blades having projections 4 to engage the said lips, and the movable blocks to engage the said projections, combined with the bushings having beveled ends and with the nut to move the said bushings, substantially as described.

3. The combination, with a rotary heel-trimming cutter, of a rand-cutter and means to rotate the said cutter independently during its rotation with the heel-trimming cutter, whereby the said rand-cutter is given a planetary motion, substantially as described.



4. The rotary heel-trimming cutter, a tipping carriage having the teeth *c*, and the hub having bearings a^3, combined with the shafts a^4, their pinions, and the rand-cutters, substantially as described.

5. A rotary heel-trimming cutter, a tread-guard, and a carriage having an attached chambered rand or counter guard, combined with a rotating hub, a series of disk-like rand-cutters, and means to give to them a planetary motion, substantially as described.

6. The rotary heel-trimming cutter, the carriage having an attached chambered or recessed rand or counter guard, and an arm b^4, combined with a loosely-held hub, on which the said carriage is pivoted, and with ball-bearings acting against the said hub, substantially as described.

413,960. BRAKE FOR ELECTRIC CARS. LOUIS PYENDE, Boston, Mass. Filed Sept. 2, 1889. Serial No. 322,690. (No model.)

Claim.—1. A brake device for a train of electric cars, comprising a chain connected with the forward brake-spindle of the motor-car, passing over a pulley on a brake-rod of the following car, and secured to the rear brake-rod of said motor-car, substantially as described.

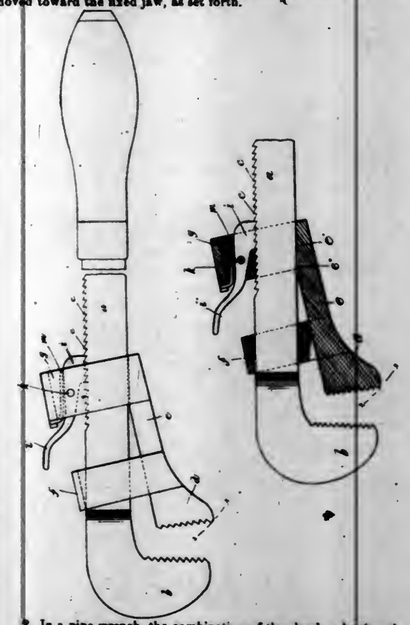
2. In a device of the character described, a car provided with a supplemental brake-rod having a pulley at its outer end and a chain passing over said pulley, its ends being respectively connected with the rear brake-rod and forward brake-spindle of the car, substantially as described.

3. In a car-brake, a pulley on the brake mechanism of a rear car and a chain passing over said pulley and connected with the brake mechanism of a forward car, substantially as and for the purpose set forth.

4. In a car-brake mechanism, a supplemental rod on a lead-car, connected with its forward brake-spindle, and a chain secured to the rear end of said rod and passing over a pulley on a forward brake-rod on a following car and connected with the ordinary brake-rod at the rear of the lead-car, substantially as described.

5. In a car-brake of the character described, an independent rod detachably connected with the forward brake-spindle of a lead-car, a supplemental rod connected with the brake-lever of a following car, a pulley on the outer end of said rod, and a chain passing over said pulley and having its ends respectively secured to said independent rod and the rear brake-rod of the lead-car, substantially as and for the purpose specified.

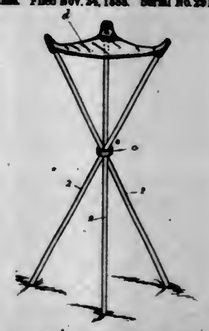
6. In a device of the character described, the combination of a motor-car provided with independent rods parallel with its brake-rods and adapted to be connected with the brake-spindles, a car having supplemental brake-rods bearing a pulley on their outer ends, and a chain passing over one of said pulleys and having its ends respectively attached to an independent rod and a brake-rod on said motor-car, substantially as described.



7. In a device of the character described, a lead-car provided with independent rods adjacent to its brake-rods and attachable to the brake-spindle, hooks in the ends of said rods, a car having supplemental rods on its brake-lever, provided with a pulley on their outer ends, and a chain attachable to an independent rod and an ordinary brake-rod of the lead-car, said chain passing over one of said pulleys, whereby the brakes of both cars may be applied by one spindle on the lead-car, substantially as described.

8. The car B, provided with the supplemental brake-rods *t v*, bearing pulleys *y x*, substantially as and for the purpose set forth.

9. The car A, provided with the independent rods *m p*, attachable to the brake-spindles, in combination with the car B, having the supplemental brake-rods *t v*, provided with pulleys *x y*, and the chain C, for connecting said pulleys with an ordinary brake-rod and the opposite independent rod of the car A, substantially as described.

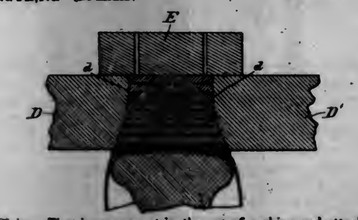


413,961. PIPE-WRENCH. DANIEL R. PORTER, Chelsea, Mass., assignor to William F. Goldthwaite, same place. Filed Mar. 15, 1889. Serial No. 303,406. (No model.)

Claim.—1. In a pipe-wrench, the combination of the shank *a*, having the jaw *b* projecting from one side and the ratchet-teeth *c* formed on its back or opposite side, the movable jaw *d*, having the arm *e* and yoke *f g*, the dog *i*, pivoted to the yoke *g* at the opposite side of the shank *a* from the jaws *b d*, and a spring whereby the dog is normally held yieldingly in engagement with the ratchet-teeth of the shank *a*, the arrangement of the pivot connecting the yoke of the movable jaw with the dog *i* being such that said jaw in swinging inwardly is also moved toward the fixed jaw, as set forth.

2. In a pipe-wrench, the combination of the shank *a*, having the jaw *b* projecting from one side and the ratchet-teeth *c* formed on its back or opposite side, the movable jaw *d*, having the arm *e*, provided with a beveled seat *e'* and yokes *f g*, the dog *i*, pivoted to the yoke *g* at the opposite side of the shank *a* from the jaws *b d*, and a spring whereby the dog is normally held yieldingly in engagement with the ratchet-teeth of the shank *a* and the beveled seat *e'* is held against the front edge of the shank, thereby holding the arm *e* in an inclined position with the jaw *d* thrown outwardly, as set forth.

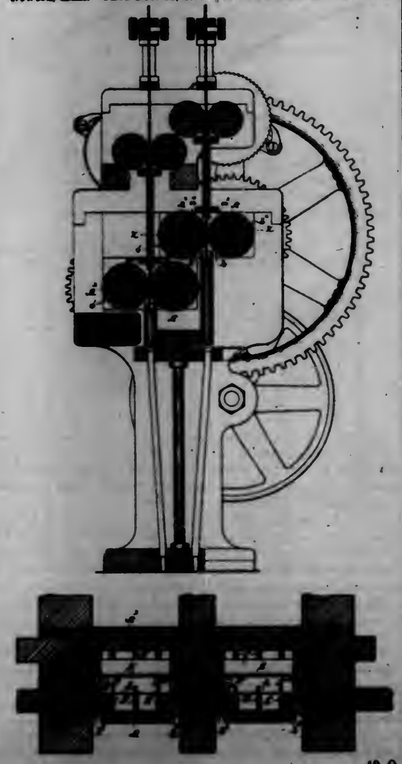
413,962. COMBINED CANE AND CAMP-STOOL. GEORGE R. PUTNAM, Boston, Mass. Filed Nov. 24, 1888. Serial No. 291,784. (No model.)



Claim.—1. A seat-support composed of a plurality of rods 2 and a loose ring *c*, adapted to slide on said rods and to connect the central portions thereof, as set forth.

2. A stool composed of the independent rods 2, the loose ring thereon, and a detachable seat engageable with the upper ends of said rods, as set forth.

3. The flexible seat *d*, having pockets 3, combined with the rods 2, formed to engage said pockets, and the loose connecting-ring on said rods, as set forth.



4. The herein-described folding camp-stool, comprising the plurality of rods, the ring loosely secured thereon, the canvas seat having corner pockets, the ferrule, and the handle to which said ring is designed to be secured, substantially as set forth.

413,963. METHOD OF ATTACHING HEELS TO BOOTS OR SHOES. FREDERICK F. RAYMOND, 2d, Newton, Mass. Filed July 25, 1887. Serial No. 245,173. (No model.)

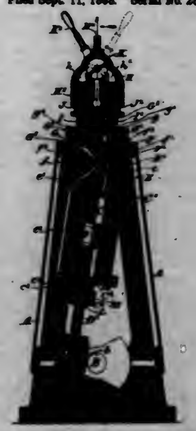
Claim.—That improvement in the art of making and attaching heels which consists in trimming a detached heel-blank to the form substantially of a finished heel, locating said finished heel-blank upon the heel end of the outsole of a boot or shoe held or supported by a last or jack, maintaining the trimmed contour of the edge of the heel-blank by side supports arranged to be held in contact therewith during the attaching of the heel, and the attaching of the heel while it is thus held, whereby the heel-blank is trimmed before attachment to the boot or shoe and its trimmed form maintained during its attachment to the boot or shoe and the subsequent trimming of the heel-blank rendered unnecessary, substantially as described.

413,964. NAIL-MAKING MACHINE. FREDERICK F. RAYMOND, 2d, Newton, Mass. Filed Feb. 11, 1889. Serial No. 299,516. (No model.)

Claim.—1. In a nail-making machine, the combination of a series of nail-pointing dies, arranged upon the same line and adapted to be simultaneously operated, with a common cut-off bar *b*, substantially as described.

2. The combination of the dies *a' a*[4] and the blocks *b* C, having head-forming cavities, and one or both of which are laterally movable across the ends of the dies, substantially as described.

3. The combination of the movable dies *a' a*[4] and the cut-off bar *b*, carried above or at the rear end of said dies and movable across the same, substantially as described.



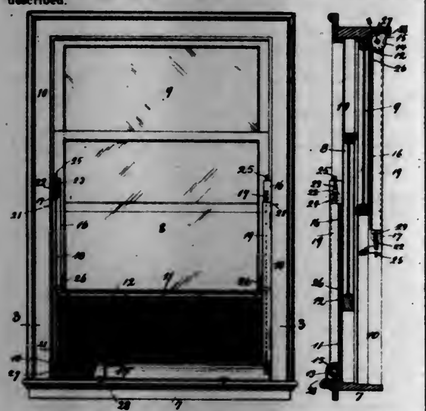
4. The combination of wire-feed mechanism with the cut-off bar or block *b*, having one or more head-forming recesses *d*, substantially as described.

5. The combination of the movable block or bar *b*, having one or more head-forming recesses *d*, with the movable presser bar or block C, adapted to co-operate with the block *b*, as described.

6. The combination of the movable block or bar *b*, having one or more head-forming recesses *d*, and the movable presser bar or block having one or more head-forming recesses *d'*, substantially as described.

7. The combination of the drawing or heading dies *a' a*[4] with the head-forming and cut-off device comprising the bars *b* C, having one or more head-forming recesses, and one or both of which are movable laterally across the line of action of the drawing-dies, substantially as described.

413,965. OSCILLATING STEAM-ENGINE. CHARLES B. RICE, Chicago, Ill., assignor to the Rice & Whitacre Manufacturing Company, same place. Filed Sept. 11, 1888. Serial No. 285,123. (No model.)



Claim.—1. The combination, with an oscillating cylinder, of a steam-valve for the same, consisting of a convex cylindric valve-seat attached to and moving with the cylinder, a movable part or sliding valve fitting against the said valve-seat and containing steam inlet and exhaust passages, a stationary part also provided with steam inlet and exhaust passages, and separate steam supply and exhaust tubes connecting said movable part or sliding valve with said stationary part, said tubes being attached to one part and sliding in the other part, said part in which the tubes slide being provided with packing rings or glands surrounding said tubes, substantially as described.

2. The combination, with an oscillating cylinder provided with a convex cylindric valve-seat, of a sliding part or valve provided with steam inlet and outlet passages and fitting against said valve-seat, an engine-frame provided with cylindric casing or valve-chest G, within which the said valve fits and slides, a spring located within said casing and pressing against the sliding valve, and an adjusting-screw engaging the wall of the casing and bearing on the spring, said screw having a nut inside the casing, and the casing being provided with a hole for the insertion of a wrench to turn the adjusting-screw, substantially as described.

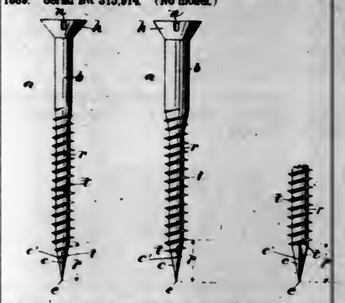
413,966. WINDOW-SCREEN. ALPHONSO RICE, Cincinnati, Ohio. Filed Feb. 15, 1889. Serial No. 300,021. (No model.)

Claim.—1. The combination of a sash, a screen connected thereto, a roller 13, to which the other end of the screen is connected, pulleys 14, secured to the ends of roller 13, pulleys 17, secured in a vertical plane with the former but a distance remote therefrom equal to a little more than the movement of the sash, as shown, an endless chain or cord passing around pulleys 14 and 17, an adjustable spring-actuated bearing 23 23 25, in which roller 17 revolves and whereby the

endless cord or chain is kept taut, and a connection from sash to the cord, whereby cord, pulleys, and roller 13 are operated, as shown and described.

2. The combination of a sash, a screen connected thereto, an adjustable telescoping roller 13, to which the other end of the screen connects, pulleys 14, secured to the ends of roller 13, pulleys 17, secured in a vertical plane with the former but a distance remote therefrom equal to a little more than the movement of the sash, as shown, an endless chain or cord passing around pulleys 14 and 17, an adjustable spring-actuated bearing 22 23 25, in which roller 17 revolves and whereby the endless cord or chain is kept taut, a connection from sash to cord, whereby cord, pulleys, and roller 13 are operated, and guides to either side of the screen to keep the latter straight, as shown and described.

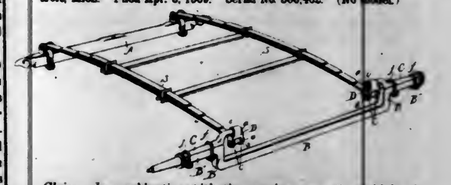
3. The combination of a sash, a screen connected thereto, an adjustable telescoping roller 13, to which the other end of the screen connects, an adjustable roller-box 15, pulleys 14, secured to the ends of roller 13, pulleys 17, secured in a vertical plane with the former but a distance remote therefrom equal to a little more than the movement of the sash, as shown, an endless chain or cord passing around pulleys 14 and 17, an adjustable spring-actuated bearing 22 23 25, in which roller 17 revolves and whereby the endless cord or chain is kept taut, a connection from sash to the cord, whereby cord, pulleys, and roller 13 are operated, and yielding guides to either side of the screen to keep the latter straight, as shown and described.



413,967. HARNESS FOR HORSE-BLANKETS. EDGAR S. ROBINSON and JOHN D. MINOR, Hobart, N. Y. Filed Apr. 16, 1889. Serial No. 307,498. (No model.)

Claim.—1. A horse-blanket comprising the blanket, the plate D, the straps leading therefrom through the blanket to the crupper, the breast-straps leading from said plate passing over the blanket and secured together across the breast of the animal, and the strap F, secured to the breast-straps and passing over the blanket below said straps, as set forth.

2. A harness for horse-blankets, comprising the plate D, straps leading therefrom to the crupper, the breast-straps E, passing forward from said plate over the blanket and having their front ends secured together, and the straps F, consisting of two sections passing over the blanket and having their upper ends secured to the breast-straps and their lower ends secured together, as set forth.



413,968. WOOD-SCREW. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed June 28, 1889. Serial No. 315,914. (No model.)

Claim.—1. As a new article of manufacture, a wood-screw having the point portion thereof provided with a sharpened unthreaded part for entering the wood and centering itself therein, and having the other part of the point portion provided with a thread gradually increasing in width and depth until it forms a part of the normal thread at the base of the point, substantially as hereinbefore described.

2. A wood-screw having a sharpened cone-shaped point portion *p*, provided with a diminishing thread *f* and a plain or unthreaded part *e*, extending from the termination of said thread to the end *c* of the point, substantially as shown, and for the purpose hereinbefore described.

413,969. VEHICLE RUNNING-GEAR. WILLIAM D. RUSSELL, Detroit, Mich. Filed Apr. 8, 1889. Serial No. 306,462. (No model.)

Claim.—In combination with the running-gear of a vehicle, the crank-axle, the arm C, mounted on the end portion B² of said axle, the inner and upward projecting end of said arm carrying the link D, said link supporting the end of the spring at right angles to and over the vertical center of the axle, for the purposes specified.

413,970. RETAINING DEVICE FOR BOTTLE-STOPPERS. JOSIAS J. SANDS, Merton, Wis. Filed May 13, 1889. Serial No. 310,604. (No model.)

Claim.—1. The combination, with the walls of a vessel-orifice having an internal groove, and with a stopper in the orifice, of a flexible metal holding-bar engaged at its ends with said groove and a plate having upturned lateral flanges interposed between the holding-bar and stopper, substantially as described.

2. The combination, with the walls of a vessel-orifice having an internal groove, and with a stopper in the orifice, of a flexible metal holding-bar engaged at its ends with said groove and a plate having upturned lateral flanges interposed between the holding-bar and stopper, said flanges being made of such length as to come into contact with the inner surface of the orifice, substantially as described.

3. The combination, with the walls of a vessel-orifice having an internal groove, and with a stopper in the orifice, of a flexible metal holding-bar engaged at its ends with said groove and a plate having upturned lateral flanges interposed between the holding-bar and stopper, said flanges being inwardly inclined, and the holding-bar being of arched form and beveled at its sides to fit within said flanges, substantially as described.

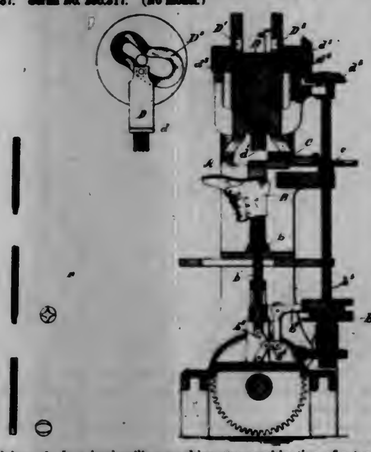
4. The combination, with the walls of a vessel-orifice having an internal groove, and with a stopper in the orifice, of a flat flexible

metal holding-bar engaged at its ends with said groove, and a flanged plate interposed between the holding-bar and stopper, said plate being apertured to allow the insertion of a lifting-tool beneath the center of the bar, substantially as described.

413,971. SASH-CORD GUIDE. ABRAM S. SCHELLINGER, Trenton, N. J. Filed Feb. 2, 1889. Serial No. 298,664. (No model.)

Claim.—1. The combination, with a sheave-case, of a block located above or below said case, and a pin inserted between the case and block to lock the case within the frame, substantially as shown and described.

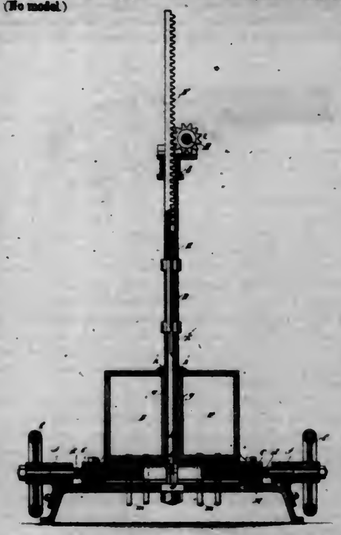
2. The combination, with a sheave-case, of a block and locking-pin that is elliptical in cross-section, substantially as described.



3. The combination, with a sheave-case provided with a spur or projection upon its lower face, of a block located above the case and provided with a spur or projection upon its upper face, and a locking-pin for locking the case within the frame, substantially as described.

413,972. AUGER. HENRY L. SEALER, Deep River, Conn., assignor of one-half to Simeon H. Jennings, same place. Filed Feb. 18, 1889. Serial No. 300,223. (No model.)

Claim.—The herein-described double-twist auger, each twist terminating in a like floor-lip, one of the said lips constructed with a depression forming a gouge-shape less in extent than the cutting-edge of said lip, substantially as described.



413,973. HEEL-NAILING MACHINE. ORESTES G. SMALL, Malden, assignor to Frederic P. Raymond, 2d, Newton, Mass. Filed Apr. 19, 1887. Serial No. 235,217. (No model.)

Claim.—1. In a heel-nailing machine, the combination of a templet with a head suspended from and operated by cams to have a variable reciprocation in relation to the templet, and a gang or group of implements to be used as awls or as drivers mounted on the one end thereof, adapted to be moved alternately or successively to operate in their two capacities, substantially as described.

2. In a heel-nailing machine, the combination, with a templet and a last or work-support between which and the templet the heel-blank is compressed, of a head suspended from cams, and thereby provided with a variable throw or vertical reciprocation in relation to the templet, and a gang or group of implements to be used as awls and as drivers mounted on the one end thereof, adapted to be moved alternately or successively to operate in their two capacities, substantially as described.

413,974. MACHINE FOR MANUFACTURING DRESS-SHIELDS. HARRIS B. SMITH, Bridgeport, Conn. Filed Jan. 5, 1889. Serial No. 295,899. (No model.)

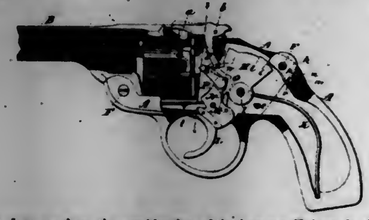
Claim.—1. The combination, with the two steam-chambers B, the parallel adjacent faces *g* of which form the female member of the die, of the reciprocating plate D, adapted to enter between said chambers and having its edge recessed to form the male member of the die, substantially as described.

2. The combination, with the two steam-chambers B, having parallel adjacent faces which form the female member of the die and having their apexes curved to approximate the curvature of the folded edge of the shield, of the reciprocating plate D, forming the male member of the die and having its edge reversely curved to conform to the curvature of the folded edge of the shield, substantially as described.

3. The combination, with the two steam-chambers B, having parallel adjacent faces which form the female member of the die, and having their apexes curved to approximate the curvature of the folded edge of the shield, of the reciprocating plate D, forming the male member of the die and having its edge reversely curved to conform to the curvature of the folded edge of the shield, but of less curvature than the curvature of the apexes of said chambers, substantially as described.

4. The combination, with the two steam-chambers B, each of which is adjustable to and from the other and having parallel adjacent faces which form the female member of the die, of the reciprocating plate D, forming the male member of the die, substantially as described.

5. The combination, with the plate D, having its edge recessed to form the male member of the die, of the two steam-chambers B, forming the female member of the die and each adjustable to and from the other, of the laterally-adjustable guides *b*, substantially as described.



6. The combination, with the plate D, having its edge recessed to form the male member of the die, of the two steam-chambers B, forming the female member of the die and each adjustable to and from the other, the laterally-adjustable guides *b*, and adjusting-screws *s*, substantially as described.

7. The combination, with the two steam-chambers B, having parallel adjacent faces which form the female member of the die and having their apexes curved to approximate the curvature of the folded edge of the shield and provided with raised ribs or flanges *h*, of the reciprocating plate D, forming the male member of the die and having its edge reversely curved to conform to the curvature of the folded edge of the shield, substantially as described.

413,975. REVOLVER. JOHN T. SMITH, Rock Fall, Conn. Filed Feb. 26, 1889. Serial No. 301,031. (No model.)

Claim.—1. In a revolver, the combination of the hammer H, hung upon a pivot within the frame, a trigger hung below and forward of

the hammer, a spring-dog N, hung in the said trigger and adapted to engage the cocking-notch of the hammer, the hammer constructed with a bearing against which the said dog rests as the hammer approaches its full-cocked position, the cylinder-hand R, hung to the trigger forward of said dog and above the pivot of the trigger, the pivot of the hand being in such relation to the pivot of the trigger that when the cylinder reaches its position of rest, under the action of the hand, the hand-pivot will have come into a line drawn from the nose of the pawl to the trigger-pivot, substantially as and for the purpose described.

2. In a revolver, the combination of the hammer H, hung in the frame, a trigger hung forward of and below the hammer, a spring-dog N, hung in the trigger and adapted to engage the hammer forward of its pivot, the mainspring K, hung to the hammer, with a stationary bearing *e* in the frame below the mainspring, and against which bearing the mainspring will strike as the hammer approaches its extreme open position, substantially as described.

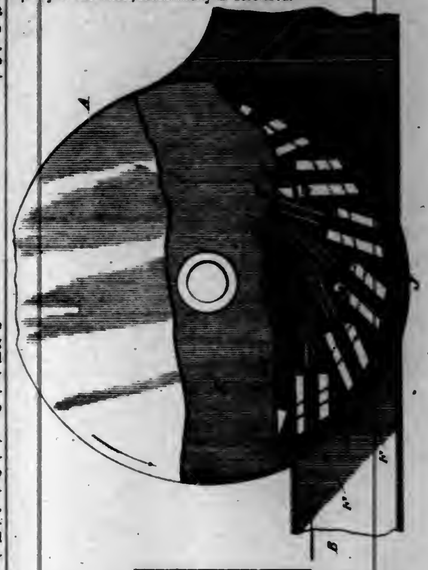
3. In a revolver, the combination of the hammer and its operative mechanism arranged in the frame, the back of the hammer constructed with shoulders *i l*, the latch A, hung upon a pivot in the frame parallel with the axis of the hammer and above the back of the hammer, the forward and rear ends of the said latch, under oscillation, adapted to engage the respective shoulders *i l* on the back of the hammer as the said hammer is in either its down or cocked position, and a spring-stop arranged to engage the said latch in either of its positions, substantially as described.

4. In a revolver, the combination of the cylinder-pawl *a*, hung in the frame at the rear of the cylinder, the pawl constructed with a spring-finger *f*, beveled on its inner rear edge, extending down into the frame and forward of the hammer, the hammer constructed with a cam *g*, the path of which is in the plane of the said finger *f*, and so that the said cam will operate upon the finger in its cocking movement, but escape from said finger in the discharge movement, substantially as described.

5. In a revolver, the combination of the hammer H, hung in the frame, the hammer constructed with a projection upon its forward side, forming a shoulder T, and the cam U, forward of said shoulder, the trigger hung forward of and below the hammer, and constructed with an upward projection P, the said projection adapted to engage the said cam and shoulder on the hammer, substantially as and for the purpose described.

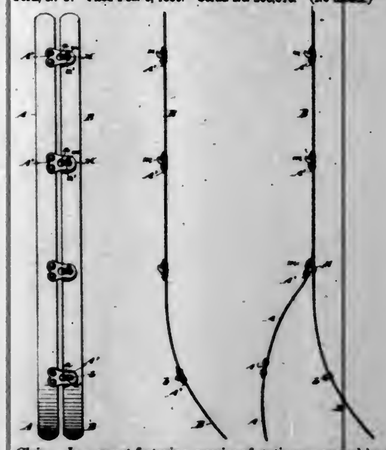
6. In a revolver, the frame A, in which the operative mechanism is arranged, a trigger-guard formed as an integral part of said frame, and with a mortise from said trigger-guard into the frame to receive the trigger, combined with a trigger composed of a finger-piece L, broader than the said mortise in the frame, and the upper portion of the trigger corresponding to said mortise and hung upon a pivot in the frame, the said finger-piece secured to the said upper portion of the trigger, substantially as described.

413,976. WATER-WHEEL. EDWARD STERN, Philadelphia, Pa. Filed Mar. 1, 1889. Serial No. 301,646. (No model.)



Claim.—1. A water-wheel with radiating arms, tubes connecting with said arms and having peripheral openings, an elastic medium in said tubes, and plungers working in the tubes and adapted to compress said medium, said parts being combined substantially as described.

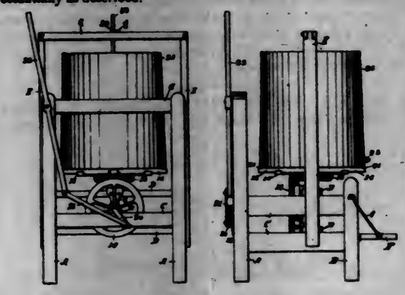
2. A water-wheel with arms having tubes with openings at the periphery of the wheel, an elastic medium in said tubes, plungers working in said tubes and adapted to compress said elastic medium, and peripheral pockets in said wheels between the openings of said tubes, said parts being combined substantially as described.



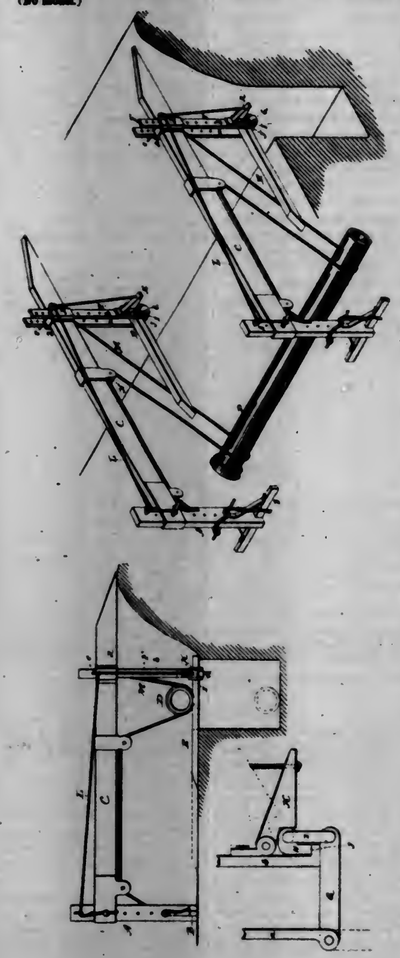
3. A water-wheel with radiating arms and having an elastic medium stored therein and disposed at a line at or about a right angle to said radiating arms on the wheel, and plunger fitted in the wheel, adapted to receive the impact or pressure of water and thereby compress said medium, substantially as described.

4. A water-wheel having radiating arms and casings disposed at or about a right angle thereto, an elastic medium in contact with said arms, and plungers bearing against said medium, the plungers and medium being located in said casings, substantially as described.

5. A water-wheel provided with casings, an elastic medium in said wheel, and plungers in said wheel adapted to compress said medium, in combination with a flume having an abutment for the periphery of the wheel, substantially as described.



413,977. CORSET-FASTENING. RANDOLPH W. STILWELL, New York, N. Y. Filed Feb. 6, 1889. Serial No. 298,816. (No model.)

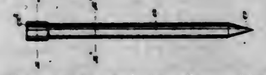


Claim.—In a corset-fastening, a series of stationary curved hooks M, projecting forward with the points *m* extending parallel to the steels, in combination with eyes *a a'*, carried on the other part or steel A, adapted to be readily detached by the bending of the steels as herein specified.

413,978. ROTARY CHURN. HENRY F. STOUTENBURGH, Davenport, Iowa. Filed Apr. 1, 1889. Serial No. 305,642. (No model.)

Claim.—In a rotary churn and frame, with mechanism for rotating the churn-body, the combination of socket-pieces attached to the inner bottom surface of the churn-body, the transverse bar 40, adapted to be held in said socket-pieces, the horizontal transverse bar 31, centrally pivoted to the upper surface of bar 40, the horizontal transverse bar 30, having angled slots, located within the interior of the churn-body and above bar 31, the vertical posts 33, connecting bars 30 and 31, the vertical wings 35, pivotally connected to said bars 30 and 31, the central vertical shaft 38, attached to the bar 30 and extending above the churn-body, the cross-bar G of the frame horizontally above the churn-cover, and means for attaching said shaft to said cross-bar, substantially as described.

413,979. APPARATUS FOR LAYING PIPE IN TRENCHES. DANIEL A. STEWART, Waterbury, Conn. Filed Apr. 8, 1889. Serial No. 306,395. (No model.)



Claim.—1. The combination of the upright A, the beam C, extending horizontally therefrom, the upright provided with a suitable base for its vertical support, a hanger F, extending down from said beam, open at its lower end, a cross-bar hinged to one side of the open lower end of said hanger, a trip and latch upon the other side to hold said cross-bar in place or permit its disengagement, and a skid-bar E, one end adapted to be supported in said hanger on said cross-bar, substantially as and for the purpose described.

2. The combination of the upright A, the horizontal beam C, extending from said upright, a vertically-adjustable hanger F, arranged upon said beam, open at its lower end, a cross-bar hinged to one side of said open lower end of the hanger and detachably engaged with the other side, so as to form a detachable support across said lower end of the hanger, the said hanger adapted to receive a skid-bar E, substantially as and for the purpose described.

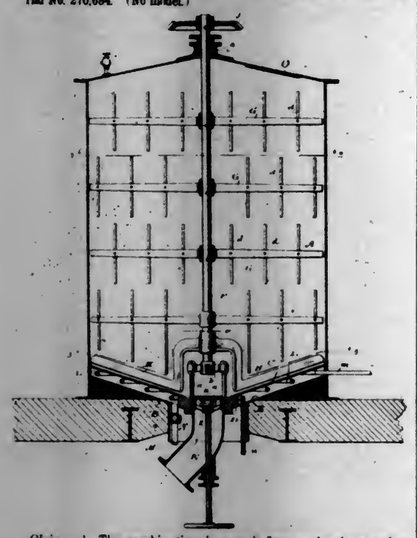
3. The combination of the upright A, the horizontal beam C, projecting therefrom, a vertical hanger F, open at its lower end, a cross-bar hinged at one side of said open lower end of the hanger, with mechanism, substantially such as described, to detachably engage said cross-bar with the other side of the open end of the hanger, the said hanger adapted to receive one end of a skid-bar E, with a line, one end attached to the beam at the hanger, a pulley arranged between said hanger and said upright, over which said line passes, and whereby a loop is formed in said line between said point of attachment and said pulley, substantially as described.

4. The combination of the upright A, the horizontal beam C, extending from said upright, the hanger provided with sockets *d d*, the hanger composed of two sides extending up through said sockets and vertically adjustable therein, the said sides detached at their lower end, a cross-bar G, hinged to one of said sides, the other side constructed with a shoulder J, a trip H, hung to said cross-bar G, and a latch K, hinged to said side *b*, substantially as and for the purpose described.

413,980. NAIL. EDWARD M. SUMNEY, South Hanover, Mass., assignor to E. Phillips & Sons, same place. Filed July 15, 1889. Serial No. 317,544. (No model.)

Claim.—The herein-described wire nail, comprising the cylindrical body or shank *a*, pointed at one end, and the cylindrical die-formed head a^2, having a length greater than its diameter, concentric with the shank, but larger in diameter, the sides of the said die-formed head being parallel with the sides of the body or shank of the nail, substantially as described.

413,981. RING OR BAIL FOR SUSPENDING OR LIFTING VESSELS. ALVIN TAPLIN, Forestville, assignor to the Bristol Brass and Clock Company, Bristol, Conn. Filed Dec. 24, 1888. Serial No. 294,467. (No model.)



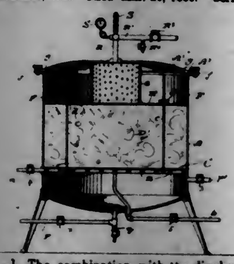
Claim.—1. A bail and attached ring having lapped ends, one of which is provided with an angular slot 15, having longitudinal and transverse portions, and the other provided with a headed pin or stud working in said angular slot, substantially as described, and for the purpose specified.

2. The combination of a ring having lapped ends arranged to move transversely one upon the other for locking said lapped ends when the ring is contracted, a bail attached to said ring, with one member located at a point near one of the lapped ends of said ring, and the other member located near the middle of the length of the band forming said ring, and the leg 11 on the opposite one of the lapped ends of the ring from that to which the adjacent member of the bail is secured, substantially as described, and for the purpose specified.

3. A bail and attached ring having lapped ends, one of which is provided with an angular slot 15 and the other with a pin or stud working in said slot, one of said ends being also provided with the

guide-leg 16, cut away in its angle for a portion of its width, while the other end of said ring is also provided with a slot 13 for engaging the solid portion at the angular bend of said leg 16, substantially as described, and for the purpose specified.

413,982. APPARATUS FOR EXTRACTING LUPULINE FROM HOPS. Jacob F. Theurer, Milwaukee, Wis. Filed Apr. 14, 1888. Serial No. 270,684. (No model.)

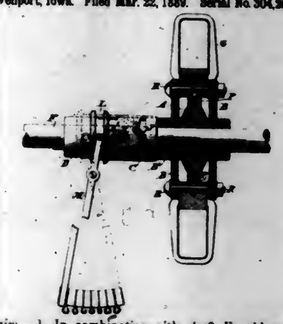


Claim.—1. The combination, in a tank for steeping hops and extracting the lupuline therefrom, of a revolving shaft, and radial arms carried thereby and having vertical fingers, a perforated false bottom, a draining-pipe leading from the space beneath the false bottom, and heating-pipes located in said space, substantially as described.

2. The combination, in a steeping-tank, of an inclined perforated false bottom, a vertical shaft stepped therein, and arms carried by the shaft in a plane parallel with that of the false bottom and in near proximity to it, a central outlet for the tank, and a separate outlet for the fluid that drains through the false bottom, both outlets controlled by suitable valves, substantially as set forth.

3. The combination, in a steeping-tank for hops, of a vertical shaft, radial arms carried thereby and having vertical fingers, a set of inclined arms also carried by the said vertical shaft, a perforated false bottom, a pipe for draining the space beneath the false bottom, a heating-coil located in said space, a central outlet for the tank, and a valve for closing the same, substantially as described.

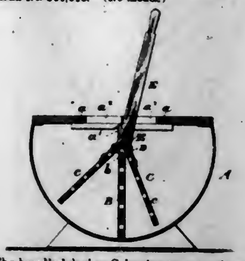
413,983. APPARATUS FOR STERILIZING AIR. Jacob F. Theurer, Milwaukee, Wis. Filed Mar. 29, 1889. Serial No. 305,375. (No model.)



Claim.—1. The combination, with the diaphragms and inclosed filtering material, of the compressing-rods, superimposed perforated cylinder, and ring and top adapted for being clamped in place on the tank, substantially as set forth.

2. The combination, in a vessel containing a fibrous filtering material, of a steam-coil, an inlet for conveying steam directly to the filtering material, an inlet for the air to be filtered, and outlets for the steam and air, substantially as described.

3. In an apparatus for sterilizing and filtering air, the combination, with a tank, of two loose perforated diaphragms, a fibrous filtering material contained between them, a steam-conductor arranged adjacent to the said filtering material, a steam-inlet for conveying steam directly thereto, an inlet for the air to be filtered, outlets for the steam and air, and one or more compressing-rods extending from the lower to the upper diaphragm and provided with a compressing and tightening nut or nuts, substantially as set forth.

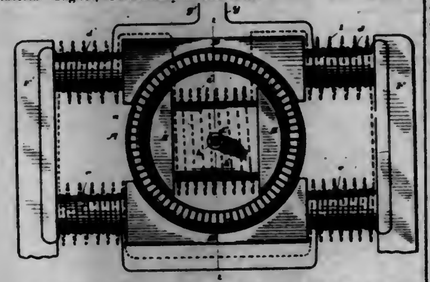


413,984. ELECTRIC-CURRENT REGULATOR. Frank Trobe, Davenport, Iowa. Filed Mar. 22, 1889. Serial No. 304,264. (No model.)

Claim.—1. In combination with shaft F, spiders B B, mounted loosely thereon and carrying the armature G, a spider A, secured rigidly upon the shaft between the spiders B B, springs P, connecting the spider A and armature G, a regulator, and a sleeve or collar C, mounted upon the shaft and connected with a moving part of the regulator, all substantially as shown.

2. In combination with shaft F, provided with fixed spider A and loose spiders B B, armature G, secured to said spiders B B, springs P, connecting the spider A with the armature, a sleeve C, provided with slots J and K, and with a groove L, a pin or stud J', secured to one of the spiders B and working in the slot J, a sleeve or collar D, secured rigidly to the shaft and provided with a pin or stud K' to work in the slot K, a regulator N, and a pivoted lever M, adapted to be actuated by the movement of the sleeve C, all substantially as shown.

413,985. CHURN. Robert L. Trimble, Newman, Ill. Filed Mar. 11, 1889. Serial No. 301,618. (No model.)



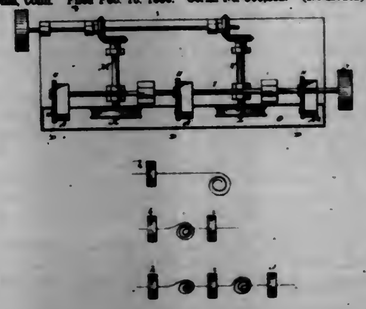
Claim.—The handled dasher C, having two equal perforated wings fastened together at a meeting angle, and the journals *d d*, projecting at the sides from the angle-piece D, in combination with the perforated dividing-board B, knife-edged at the top, and the churn-body A, having the vertical grooves *a' a'*, as and for the purpose specified.

413,986. ALTERNATE-CURRENT INDUCTION-MOTOR. Charles J. Van Depoele, Lynn, Mass. Original application filed May 4, 1888, Serial No. 308,503. Divided and this application filed July 29, 1889. Serial No. 319,088. (No model.)

Claim.—1. An electro-dynamic motor for use with alternating or intermittent currents, comprising an armature wound with closed-circuit conductors, an exterior field-magnet system acting to polarize said armature-core, and a stationary secondary field-magnet system within the armature for reacting upon the poles induced by the exterior field-magnet and then in turn creating other poles to be reacted upon by the exterior field-magnet, and vice versa.

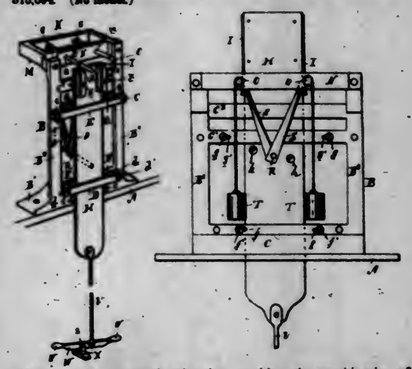
2. An electro-dynamic motor comprising a rotating armature provided with one or more closed circuits upon its armature-core, an interior stationary field-magnet system arranged to polarize the armature-core by induction, and an exterior field-magnet system reacting upon the poles produced by the interior magnet, and itself in turn establishing other poles in the armature to be reacted upon by the interior magnet, substantially as described.

3. An electro-dynamic motor comprising an armature having an iron core and a closed circuit or circuits thereon, an exterior inducing system comprising field-magnet poles in inductive relation to the armature-conductor, an interior secondary field-magnet, the polar extensions of which are between the poles of the main field-magnet, magnetizing-coils upon said secondary field-magnet, and a secondary winding in closed circuit with the said secondary field-magnet coils and in inductive relation to the coils of the primary field-magnet.



4. An electro-dynamic motor comprising an armature wound with closed-circuit conductors, an exterior field-magnet system acting to polarize said armature-core, a secondary field-magnet within the armature for reacting upon the poles induced by the exterior field-magnet and then in turn creating other poles to be reacted upon by the exterior field-magnet, and vice versa, a single external source of current energizing one of the field-magnets, and coils in secondary relation to said field-magnet and connected to magnetizing-coils upon the other field-magnet.

413,987. COMBINED SHIRT AND VEST. Clarence Wagner, Charleston, S. C. Filed June 27, 1889. Serial No. 315,610. (No model.)



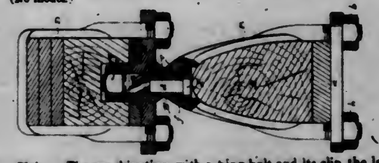
Claim.—The combination, with a shirt, of vest-sections the upper ends of which terminate below the shoulders, each section being secured at its side edges near their upper ends to the shirt, leaving the central portions of said upper ends disconnected for the passage of the suspenders between the shirt and vest sections, and back straps secured to the rear lower edges of each section, substantially as set forth.

413,988. MODE OF DRAWING WIRE. William Wallace, Ansonia, Conn. Filed Feb. 18, 1889. Serial No. 300,332. (No model.)

Claim.—The herein-described improvement in drawing wire, which consists in drawing the wire into several reducing-dies while the said dies are detached from the machine in which the drawing is to be done, leaving the said dies on the wire preparatory to the introduction to the drawing-machine, substantially as described.

413,989. CAPSULE-TRIMMING MACHINE. John L. Warren and John R. Warren, Detroit, Mich. Filed June 21, 1889. Serial No. 315,094. (No model.)

Claim.—1. In a capsule-trimming machine, the combination of the reciprocating knife-bearing plate H with the ways in which the knife-bearing plate reciprocates, the pitman U, the foot-treadle W, the knives I, and the revolving spindles O, all substantially as described.



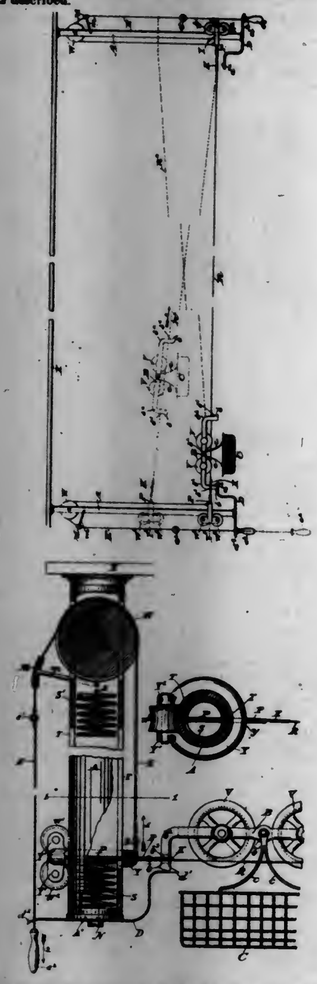
2. In a capsule-trimming machine, the combination of the knife-bearing plate H with the ways in which the knife-bearing plate reciprocates, the means for reciprocating the knife-bearing plate, the knives, the friction driver for revolving the capsule, the revolving spindle, and the belt and weight for revolving the spindle, all substantially as described.

3. In a capsule-trimming machine, the combination of the knife-bearing plate with the means for reciprocating the knife-bearing plate, the knives, the friction driver for revolving the capsules, the revolving spindles, and the means for revolving the spindles, substantially as described.

4. In a capsule-trimming machine, the combination of the knife-bearing plate with the means for reciprocating the knife-bearing plate, the knives, the revolving grooved spindles, the means for revolving the grooved spindles, and the friction driver for revolving the capsule, all substantially as set forth.

5. In a capsule-trimming machine, the combination of the reciprocating knife-bearing plate with the means for reciprocating the knife-bearing plate, the rear guides, the side guides, and the spring-bars in front of the reciprocating plate for preserving the alignment of the knives with the grooves in the spindles, the grooved revolving spindles, the means for revolving the spindles, and the knives, substantially as described.

413,990. KING-BOLT CONNECTION FOR VEHICLES. John P. Wiesmann, Milwaukee, Wis. Filed Aug. 30, 1889. Serial No. 321,981. (No model.)

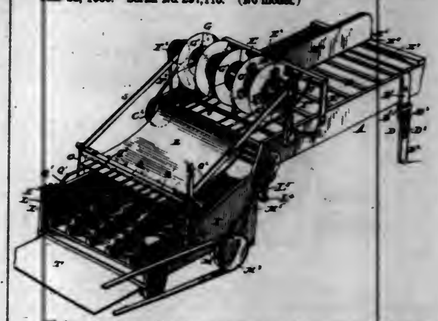


Claim.—The combination, with a king-bolt and its clip, the latter having a rounded projection on its upper side through which the king-bolt passes, of a wear-plate fitting the round portion of the clip and having a squared opening through which a squared portion of the king-bolt passes, a nut for securing the king-bolt in the wear-plate, and means for securing the wear-plate to the bolster.

413,991. STORE-SERVICE APPARATUS. Thomas Wilson, Jr., Watervliet, N. Y. Filed May 17, 1889. Serial No. 311,202. (No model.)

Claim.—1. In a store-service apparatus, the combination of the vertically-depending tube formed with oppositely-arranged vertical guide-slots, a sliding yoke arranged on the tube, friction-rollers jour-

naled in the yoke to bear on the face of the tube, a track-supporting pin arranged in the sliding yoke and through the slots of the tube, and mechanism for lifting the sliding yoke and track-supporting pin, substantially as described.



2. In a store-service apparatus, the combination of a vertically-depending tube formed with oppositely-arranged vertical slots, a sliding yoke arranged on the tube, provided with friction-wheels to bear against the face of the tube, a track-supporting pin extending through the sliding yoke and through the slots of the tube, mechanism to lift the sliding yoke and track-support, and elastic cushions interiorly arranged in the top and bottom of the tube to contact the track-supporting pin, substantially as and for the purpose specified.

3. In a store-service apparatus, the combination of the vertically-depending tube having oppositely-arranged vertical slots, a sliding yoke on the exterior of the tube, a track-holding pin in the yoke and extending through the slots of the tube, a wire track, and an extensible spring-connection supporting the end of the track and fixed to the end of the track-holding pin, substantially as and for the purpose specified.

4. In a store-service apparatus, a dependent oppositely-slotted tube, such as described, combined with a vertically-movable yoke, and a mechanism for producing such movements, and provided with the shoe D, formed with the catch d' and the claw d^2, as hereinbefore described and set forth.

413,992. BAND-CUTTER AND FEEDER. ADOLPHUS J. WIEST, CHARLES H. WIEST, and HENRY J. C. RICHTER, Grand Harbor, Dak. Filed Jan. 22, 1889. Serial No. 297,113. (No model.)

Claim.—1. In combination with a feeder-frame and platform, a series of teeth Q', extending in the same general direction with the platform, vertically-adjustable supports for said teeth, and means for securing the supports rigidly in position.

2. In combination with a feeder-frame and platform, a series of teeth Q', extending in the same general direction with the platform, a rocking frame in which said teeth are mounted, vertically-adjustable supports for the rocking frame, and means for securing the supports rigidly in position.

3. In combination with a feeder-frame and platform, a series of teeth Q', extending in the same general direction with the platform, a rocking frame in which said teeth are carried, a shield R, secured to the rocking frame, and means for securing the rocking frame in its adjusted positions, all substantially as shown.

4. In a combination with a feeder-frame and platform, a series of teeth Q', extending in the same general direction with the platform, a shield, as R, a rocking frame by which said teeth and shield are carried, vertically-adjustable supports for said rocking frame, and means for locking the supports and rocking frame in position.

5. In combination with a feeder-frame and platform, a cross-bar Q and supports for the same, teeth Q', projecting from one side of the bar, and a shield R, projecting from the opposite side, said shield and teeth being substantially parallel with the platform.

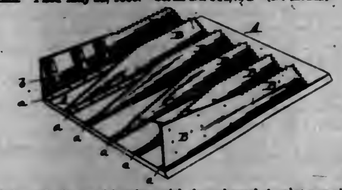
6. In combination with a feeder-frame provided with eyes N, a series of teeth Q', notched upright supporting the teeth and engaging the eyes, and pawls P, all substantially as shown.

7. In combination with a feeder-frame I and its platform J, links pivotally supporting the lower end of the platform, a rock-shaft L^4, and an elbow-lever secured to the rock-shaft and connected with the upper end of the platform, all substantially as shown, whereby the upper end of said platform has an up and down and backward and forward movement, while the lower end has only a swinging movement.

8. In a combined band-cutter and feeder, the combination, with a frame I, having a feeder, of a frame A, in which the cutters are mounted, detachably connected with the frame I, and a series of rake-fingers mounted upon the feeder-frame and having their supports pivotally connected with the frame A, whereby the machine is adapted to be folded into compact form.

9. In a machine substantially such as shown, the combination, with frame A and apron B, of the center board E^6, the rotatable disk in line with the center board and forming a continuation thereof, and the cutting-disks on both sides of the said center board, all substantially as shown.

10. In combination with frame A and apron B, cutting-disks G, teeth U, extending in the same general direction with the apron, between the disks and terminating at the delivery end of the apron, a frame I, provided with a platform J, and a shield R, carried by said frame I and extending up to the ends of the teeth U.



11. In combination with frame I, a platform J, mounted therein and provided with bars K, extending lengthwise thereof, a press rake or shield R, extending across the frame directly above the platform, and means, substantially such as shown, for imparting an upward and forward and downward and backward motion to the platform.

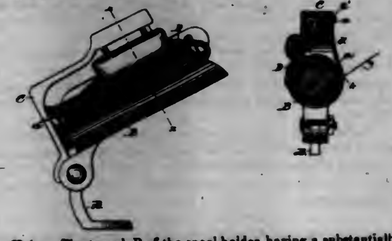
12. In combination with frame I, a platform J, mounted therein and provided with a series of longitudinal A-shaped bars, means for imparting motion to the platform, and a shield, as R, directly above the bars, all substantially as shown.

13. In combination with frame I, a platform J, provided on its upper face with a series of notched A-shaped bars separated from one another and extending lengthwise of the platform, a shield R, extending across the frame at the receiving end, and means for imparting motion to the platform.

14. In combination with frame I, a platform J, provided on its upper face with notched A-shaped bars K, higher at the receiving end than at the delivery end, and separated to form channels, as shown, means for imparting an upward and forward and downward and backward movement to the receiving end of the platform, and a press rake or shield R, extending across the frame above the receiving end of the platform.

413,993. FEEDER-PLATFORM. ADOLPHUS J. WIEST and HENRY J. C. RICHTER, Grand Harbor, Dak., and CHARLES H. WIEST, Northfield, Minn. Filed May 22, 1889. Serial No. 311,794. (No model.)

Claim.—1. In combination with base-board A, plates or bars B' B', increasing in height, and intermediate plates or bars B B, decreasing in height toward the delivery end, all substantially as shown.



2. In combination with base-board A, plates or bars B B, applied to the upper face thereof, and having their upper edges parallel with the base-board throughout a portion of their length and decreasing in height from the termination of said parallel portion toward the delivery end.

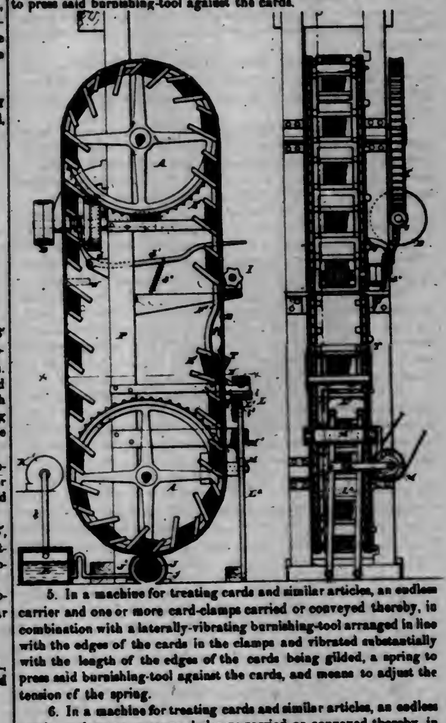
3. In combination with base-board A, plates or bars B B, decreasing in height toward the delivery end and notched on their upper edge, and plates B' B', increasing in height toward the delivery end and also notched on their upper edge.

4. In combination with base-board A, plates or bars B and B', the former decreasing in height toward the delivery end of the platform, and ribs *b b*, secured to the inner faces of the plates B' at approximately right angles to the board A.

5. In combination with base-board A, plates or bars B' B', applied thereto, and ribs or flanges secured to the inner face of each bar or plate and projecting outwardly therefrom.

413,994. SPOOL-HOLDER. CHARLES W. WOOD, Baltimore, Md., assignor of one-half to George Draper & Sons, Hopedale, Mass. Filed July 20, 1889. Serial No. 318,128. (No model.)

Claim.—The trough B of the spool-holder, having a substantially straight edge 4, and the head C and a weighted lip D at one side thereof, combined with the blade *d*, connected to the said head C and extended downwardly to place its lower edge close to the said edge 4, to operate as shown and described.



413,995. MACHINE FOR TREATING CARDS. CHARLES A. WRIGHT, Philadelphia, Pa. Filed Jan. 7, 1889. Serial No. 295,646. (No model.)

Claim.—1. In a machine for treating cards and similar articles, an endless carrier, in combination with a series of card-clamps carried or conveyed thereby and a burnishing-tool having a movement relatively to the card-clamp.

2. In a machine for treating cards and similar articles, an endless carrier and one or more card-clamps carried or conveyed thereby, in combination with a laterally-vibrating burnishing-tool arranged in line with the edges of the cards in the clamps.

3. In a machine for treating cards and similar articles, an endless carrier and one or more card-clamps carried or conveyed thereby, in combination with a laterally-vibrating burnishing-tool arranged in line with the edges of the cards in the clamps and vibrated substantially with the length of the edges of the cards being gilded.

4. In a machine for treating cards and similar articles, an endless carrier and one or more card-clamps carried or conveyed thereby, in combination with a laterally-vibrating burnishing-tool arranged in line with the edges of the cards in the clamps and vibrated substantially with the length of the edges of the cards being gilded, and a spring to press said burnishing-tool against the cards.

5. In a machine for treating cards and similar articles, an endless carrier and one or more card-clamps carried or conveyed thereby, in combination with a laterally-vibrating burnishing-tool arranged in line with the edges of the cards in the clamps and vibrated substantially with the length of the edges of the cards being gilded, a spring to press said burnishing-tool against the cards, and means to adjust the tension of the spring.

6. In a machine for treating cards and similar articles, an endless carrier and one or more card-clamps carried or conveyed thereby, in combination with a transversely vibrating or reciprocating frame and two or more burnishing-tools arranged laterally thereon at different distances apart.

7. In a machine for treating cards and similar articles, an endless carrier and one or more card-clamps carried or conveyed thereby, in combination with a transversely vibrating or reciprocating frame, two or more burnishing-tools arranged laterally thereon at different distances apart, and springs to press said burnishing-tools against the cards

8. In a machine for treating cards and similar articles, the combination of an endless carrier, one or more card-clamps carried or conveyed thereby, and a burnisher arranged in the path of the card-clamps and so that their cards shall be moved past and in contact with the burnisher.

9. In a machine for treating cards and similar articles, the combination of an endless carrier with a series of detachable card-clamps carried or conveyed thereby and a burnishing device for burnishing the cards held in the clamps as they are moved past the burnisher.

10. In a machine for treating cards and similar articles, the combination of a carrier, a series of card-clamps carried or conveyed thereby, and a cutting tool or device arranged in the path of the cards in the clamps.

11. In a machine for treating cards and similar articles, the combination of a carrier, a series of card-clamps carried or conveyed thereby, and a rotary cutting tool or device arranged in the path of the cards in the clamps.

12. In a machine for treating cards and similar articles, the combination of a carrier and clamps for moving packs of cards past given points with a burnishing tool or device and an embossing or indenting device in the path of the cards and so arranged as to act on the gilded cards after leaving the burnisher.

13. In a machine for treating cards and similar articles, the combination of a carrier and clamps for moving packs of cards past a given point with an embossing or indenting device arranged in the path of the cards.

14. In a machine for treating cards and similar articles, the combination of a carrier and clamps for moving packs of cards past given points with a cutter to cut the edges of the cards and a burnisher to burnish the edges after being cut and treated with gold.

15. In a machine for treating cards and similar articles, a conveyer to move a card past a given point, in combination with an embossing device arranged in the path of the card and against which it is pressed.

16. In a machine for treating cards and similar articles, a conveyer to move a card past a given point, in combination with a burnishing device arranged in the path of the card and against which it is pressed.

17. In a machine for treating cards and similar articles, a carrier device moving past a burnisher, a detachable card-clamp detachably connected to the carrier and so as to present the edge of the card or cards in the clamp to the burnisher as it is passed, and a burnisher arranged in the path of the card or cards held in the clamp.

18. In a machine for treating cards and similar articles, a carrier device moving past a burnisher, a detachable card-clamp detachably connected to the carrier and so as to present the edge of the card or cards in the clamp to the burnisher as it is passed, and a movable burnisher arranged in the path of the card or cards held in the clamp.

19. In a machine for treating cards and similar articles, an endless carrier having a series of card-clamps, in combination with a waxing-brush to wax the gilded edges of the cards, an inclosing-case to receive the gold-leaf brushed off the cards, a pipe leading from said case to a closed tank below the liquid-level, and an exhauster for exhausting the air from said tank and the case around the brush.

20. In a machine for treating cards and similar articles, an endless carrier having a series of card-clamps, in combination with a waxing-brush to wax the gilded edges of the cards, an inclosing-case around said brush, a liquid-tank, and means for exhausting the air from said case for collecting the waste gold-leaf brushed from the cards.

21. In a machine for treating cards and similar articles, an endless carrier having a series of card-clamps, in combination with a waxing-brush to wax the gilded edges of the cards, an inclosing-case around said brush, a liquid-tank, and means for exhausting the air from said case for collecting the waste gold-leaf brushed from the cards in said liquid-tank below the liquid.

22. In a machine for treating cards and similar articles, an endless carrier having a series of card-clamps, in combination with a waxing-brush to wax the gilded edges of the cards, an inclosing-case around said brush, a liquid-tank, means for exhausting the air from said case for collecting the waste gold-leaf brushed from the cards, and a burnishing device arranged in the path of the cards after leaving the waxing-brush.

23. In a machine for treating cards and similar articles, an endless carrier having a series of card-clamps, in combination with a waxing-brush to wax the gilded edges of the cards and a burnishing device arranged in the path of the cards for burnishing the waxed gilded edges of said cards.

24. In a machine for treating cards and similar articles, the combination of an endless carrier and a series of card-clamps conveyed thereby, a movable frame arranged close to the clamps, a stationary guide therefor, and a burnishing-tool carried upon said movable frame and movable with it.

25. In a machine for treating cards and similar articles, the combination of an endless carrier and a series of card-clamps conveyed thereby, a movable frame arranged close to the clamps, a stationary guide therefor, a burnishing-tool carried upon said movable frame and movable with it, and a spring to press said burnishing-tool toward the edges of the cards in the clamps.

26. In a machine for treating cards and similar articles, the combination of an endless carrier, detachable card-clamps carried thereby, and a stationary guide F, to guide said carrier and clamps in a portion of its length, and in which the said guide is formed with a curved part *f*, bent away from the carriers to allow the clamps to be released from the carrier.

27. In a machine for treating cards and similar articles, an endless carrier, in combination with a series of card-clamps conveyed thereby, and in which the front edges of the clamps and their cards are all in the same plane when passing a given point.

28. In a machine for treating cards and similar articles, an endless carrier, in combination with a series of card-clamps conveyed thereby, in which the front edges of the clamps and their cards are all in the same plane when passing a given point, and a burnishing-tool arranged at said point to treat the cards in succession as they are conveyed past it.

29. In a machine for treating cards and similar articles, an endless chain carrier, in combination with a series of card-clamps conveyed thereby, and in which the front edges of the clamps and their cards are all in the same plane with the line of the carrier-chains.

30. In a machine for treating cards and similar articles, the combination of two endless chains, each having notched projections at intervals apart, in combination with two or more card-clamps having pins or projections to fit into the notches, and thereby connect the clamps with the chains.

31. In a machine for treating cards and similar articles, the combination of two endless chains B, having thin links at given distances apart alternately provided with notched or slotted projections B' and spring snap-hooks B^2, and card-clamps provided with pins or projections R to fit into the notches or slots and under the hooks.

32. In a machine for treating cards and similar articles, the combination of two endless chains B, having thin links at given distances apart alternately provided with notched or slotted projections B' and spring snap-hooks B^2, card-clamps provided with pins or projections R, to fit into the notches or slots and under the hooks, the fixed guide F, having the curved part *f*, to guide said chains B and pins R, and a stop T in the path of said hooks, to release the clamp when they reach the curved part *f* of the guide.

33. In a machine for treating cards and similar articles, the combination of an endless carrier having a series of card-clamps, power mechanism to move said endless carrier, a clutch device to arrest the movement of the carrier, a lever to operate the clutch, and projections carried by the carriers to actuate the lever at given times in the travel of said carrier to stop the machine.

34. In a machine for treating cards and similar articles, the combination of an endless carrier having a series of card-clamps, power mechanism to move said endless carrier, means to stop the action of the power mechanism to arrest the movement of the carrier, and automatic mechanism actuated by the carriers or their connections to stop the movement of the carrier at given times in its travel.

35. In an organized machine for treating cards, a card-clamp for card-gilding and other purposes, consisting of the boards H and H', the section A', having jaw A, section A^2, having jaw A^3, and clamping-screw G, substantially as set out.

36. In an organized machine for treating cards, a card-clamp for card-gilding and other purposes, consisting of the boards H and H', of different lengths, the section A', having jaw A, section A^2 having jaw A^3, and clamping-screw G, substantially as set out.

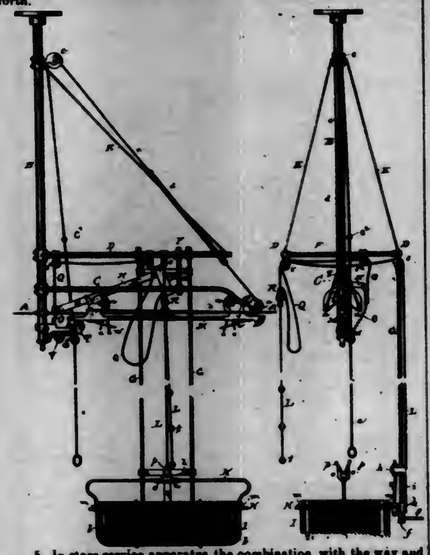
37. In an organized machine for treating cards, a card-clamp for card-gilding and other purposes, consisting of the boards H and H', the section A', having jaw A, section A^2, having jaw A^3, clamping-screw G, and spring *g*, to spread the jaws apart, substantially as set out.

38. In an organized machine for treating cards, a card-clamp for card-gilding and other purposes, consisting of the boards H and H', having pins R on their ends and near their front edges, the section A', having jaw A, section A^2, having jaw A^3, and clamping-screw G, substantially as set out.

39. In an organized machine for treating cards, the combination of two clamping boards or parts H H', having pins or projections R upon their ends and near their front edges, and a suitable clamping device to draw the parts H H' toward each other.

40. In an organized machine for treating cards, the combination of two clamping boards or parts H H', of different lengths and having pins or projections R upon their ends and near their front edges, and a suitable clamping device to draw the parts H H' toward each other.

41. An endless carrier, in combination with a series of card-clamps carried thereby, having their clamping-surfaces arranged at an angle to the line of travel, whereby the front edges of the cards clamped in the several clamps shall move in the same plane in passing a given place or places.



413,996. STORE-SERVICE APPARATUS. HENRY YOH, Detroit, Mich., assignor to the Rapid Service Store Railway Company, same place. Filed May 16, 1887. Serial No. 238,316. (No model.)

Claim.—1. In store-service apparatus, the combination of a way, a carrier placed thereon, a receptacle, devices for detachably securing the receptacle to said carrier, an elevator for raising and lowering said receptacle, a cord for raising the elevator, a releasing device, and a separate cord for operating the releasing device, substantially as set forth.

2. In store-service apparatus, the combination, with the way and the carrier thereon having a detachable receptacle, of the vertical standard at the end of the way, an arm extending from said standard, rods extending downwardly from said arm, a frame sliding on said rods, and the holder attached to said frame for the parcel-receptacle, substantially as set forth.

3. In store-service apparatus, the combination, with the way and the carrier thereon, of the vertical standard at the end of the way, the propelling device in front of the standard, the branching arms extending out from said standard, the vertical rods extending down from one of said arms at the side of the way, the frame sliding on said rods, and the holder projecting from said frame under the way for holding the parcel-receptacle, substantially as set forth.

4. In store-service apparatus, the combination, with the way and the carrier thereon, of the elevator consisting of a sliding frame and a laterally-extending holder consisting of a continuous loop attached to said frame, and the parcel-receptacle fitting within the holder and having lugs or projections adapted to rest thereon, said receptacle being adapted to detachably engage said carrier, substantially as set forth.

5. In store-service apparatus, the combination, with the way and the carrier thereon, of the parcel-receptacle, two arms pivotally mounted above the receptacle, connected thereto, and held together at their lower ends by springs, and adapted to engage said carrier when they pass above it by the upward movement of the receptacle, substantially as set forth.

6. In store-service apparatus, the combination, with the way and the carrier thereon, of the receptacle detachably engaging with said carrier at its middle part, and a spring near each end of the carrier contacting with said receptacle to steady it, substantially as set forth.

7. In store-service apparatus, the combination, with the way and the carrier thereon, of the parcel-receptacle having attached above it the two pivoted arms held together at their lower ends by springs and adapted to engage said carrier when they pass above it by the upward movement of the receptacle, a releasing device for forcing said arms apart, and a connection extending within reach of the operator for moving said device, substantially as set forth.

8. In store-service apparatus, the combination, with the way and the carrier thereon, of the parcel-receptacle having attached above it the two pivoted arms held together at their lower ends by springs and adapted to engage said carrier when they pass above it by the upward movement of the elevator, the pivoted spring-retracted bar provided with a forked head adapted to descend on each side of said pivoted engaging-arms, and the cord for moving said bar against its spring, substantially as set forth.

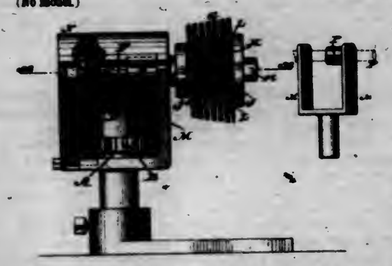
9. The combination of the way, the carrier thereon, and the receptacle adapted to detachably engage said carrier, said carrier being provided with the downwardly-extending fingers, and the flat spring at each end for steadying the receptacle, substantially as set forth.

10. In store-service apparatus, the combination of the way, the carrier thereon having a hooked end, and the hinged catch carrying a corrugated roller, with which said hooked end of the carrier engages, substantially as set forth.

11. In store-service apparatus, the combination of the way, the carrier thereon having a hooked end, the catch-plate, the hinged catch supported thereby, and the coiled spring attached rigidly to said plate at one end and its other end projecting into the path of the carrier, substantially as set forth.

12. In a store-service apparatus, the combination, with a standard, a lateral arm on the standard, and a track beneath the arm, of a car on the track, an automatic latching device carried by the receptacle for connecting the receptacle to the car, a guide supported by the lateral arm, and an elevator mounted on said guide and having a holder to engage lugs on the receptacle, substantially as described.

418,997. STEAM-BOILER FIRE-BOX. JOHN ABELL, Toronto, Ontario, Canada. Filed Mar. 28, 1889. Serial No. 305,063. (No model.)

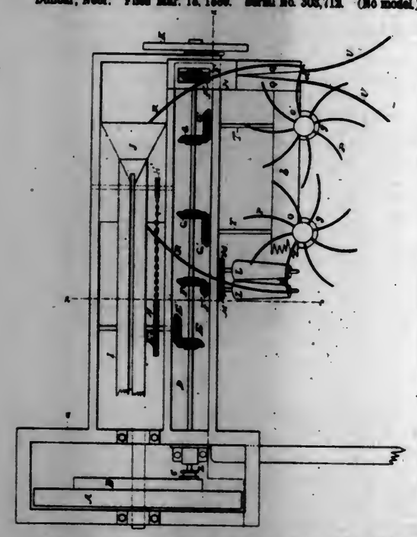


Claim.—1. A fire-box having its lower portion extending beyond the tube-sheet and having its upper portion, where the flues enter, partially separated from its lower portion by a hollow chamber arranged adjacent to the flues and extending from the tube-sheet to a point near the opposite side of the fire-box, and provided with openings leading to the outside of the boiler to admit air, which is heated and escapes into the fire-box at the point where the smoke and heated gases pass the hollow chamber, substantially as and for the purpose specified.

2. The fire-box A, having its lower portion projecting beyond the tube-sheet C and its upper portion D separated by a hollow perforated chamber E, having holes F to connect it with the outside of the boiler, substantially as and for the purpose specified.

3. A fire-box having a hollow perforated air-chamber E located below the tubes, so as to separate the combustion-chamber D from the lower portion of the fire-box, and a perforated air-chamber G, located substantially opposite to the perforated air-chamber E, substantially as and for the purpose specified.

413,998. APPARATUS FOR CLEANING WOOL-COMBS. REUBEN AGHBOTH, Crum Lynne, Pa. Filed Apr. 20, 1889. Serial No. 308,060. (No model.)



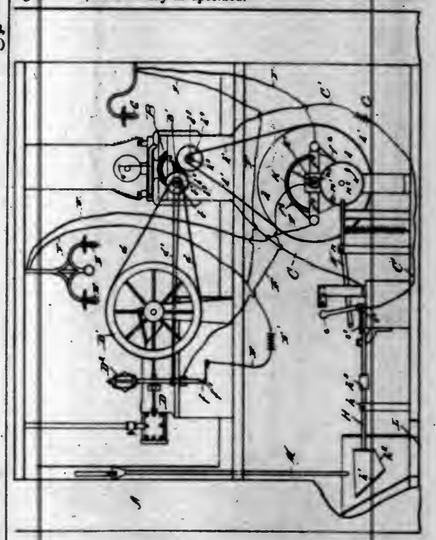
Claim.—1. A brush for cleaning combs, having a shaft supporting the same and an arm forming the bearing for said shaft, in combination with a shaft having a gear-wheel meshing with the circular rack of the combing-machine, said shafts being geared together, all substantially as described.

2. An apparatus for cleaning combs, consisting of a shaft suitably journaled and with a gear-wheel thereon, mechanism, substantially as described, for rotating said gear-wheel, a bevel-wheel on the end of said shaft, a counter-shaft with a bevel-wheel meshing with said first bevel-wheel, an arm in which said counter-shaft is journaled, a housing secured to said arm and inclosing said bevel-wheel, and a brush

on the outer end of said counter-shaft, said parts being combined substantially as described.

3. In an apparatus for cleaning combs, a shaft with a bevel-wheel thereon, mechanism, substantially as described, for rotating said shaft, a sleeve on the outer end of said shaft, having a collar on its inner end, a head with wires on said sleeve, a collar on said shaft outside of said head and bearing against it, and a nut on the threaded end of the shaft, said parts being combined substantially as described.

413,999. CORN-GATHERING MACHINE. SAMUEL A. ARBUCKLE, Dunbar, Nebr. Filed Mar. 18, 1889. Serial No. 303,712. (No model.)



Claim.—The corn-gathering machine consisting of the inclined frame-like bars, the sets or pairs of inclined tapered rollers arranged below and coincidently with said inclined frame-like bars, and each pair geared together and to a common shaft, the inclined pairs of knives arranged above said inclined rollers and having their cutting-edges inclined toward each other, the guide-prongs connected to the forward or elevated ends of said knives and curving forward, downward, and outward from each other, the reels having curved horizontal arms [illegible] intermediately of said sets or pairs of knives, prongs, and rolls upon cross-bars or supports connected with the inner knives at their outer ends, said reels having their shafts geared to said common shaft, the horizontal chute comprising a series of spaced-apart wire rods curved and covering at their inner ends and connected to the hopper, the hopper and inclined elevator, the curved guide-rims extending from the hopper above said chute and terminating adjacently to the guide-prongs, and mechanism to actuate the said geared-together shafts, substantially as set forth.

414,000. COIN-OPERATED DISPLAY APPARATUS. EDWARD H. AMET, Chicago, Ill., assignor to himself and Herbert A. Streeter, same place. Filed Mar. 29, 1889. Serial No. 305,223. (No model.)

Claim.—1. In a coin-operated-machinery display apparatus, the combination, with a case having a coin chute or passage, of a coin-operated lever, an electric motor, a battery, an electric circuit having a movable contact-piece operated by said coin-lever, a display-engine connected with said motor, an electric-light battery and circuit, said engine having a governor, a movable contact-piece for making and breaking the light-circuit connected with and operated by said governor, and a circuit-breaking mechanism connected with the motor for breaking the motor-circuit after the lapse of a certain period, substantially as specified.

2. The combination, with a case having a coin chute or passage M, of coin-operated lever H, movable contact *c*, operated by said lever H, electric motor B, battery C, motor-circuit C′, engine D, connected with said motor and furnished with governor D^2, electric lights E and G, light-circuit F and battery F′, contact f' and movable contact *f*, connected with said governor D^2, revolving circuit-breaker K, connected with and driven by said motor, contact-pieces f^3 and f^5 in said light-circuit F, whereby the lights E and G are alternately lighted and extinguished, lever N, and revolving circuit-breaker wheel n^2, having projection *n*′, substantially as specified.

3. The combination, in a display apparatus, of an electric motor with a display-engine, a battery and motor-circuit, a case having a coin-receiving chute or passage, and mechanism for closing the electric circuit by the fall or passage of the coin, an electric light and electric-light circuit, and mechanism for making and breaking the electric-light circuit, substantially as specified.

4. The combination, with a case having a coin passage or chute M, of a coin-operated lever H, having a shield or plate *h*′ in the path of the coin, an electric circuit, and a movable contact-piece operated by said lever H, substantially as specified.

5. The combination, with a case having a coin-passage, of a coin-operated lever having a hopper provided with an inclined side arranged in the path of the coin and furnished with an opening in its bottom for the coin to pass through, so that the lever will be operated by the impact of the coin and then automatically discharge the coin through the opening, substantially as specified.

6. The combination, with a case having a coin-passage, of a coin-operated lever having a hopper arranged in the path of the coin and furnished with an opening for the coin to pass through, so that the lever will be operated by the impact of the coin and then automatically discharge the coin through said opening, said coin passage or chute having an inclined portion provided with an opening for the coin to pass through, and a projection for deflecting coins of the required size through said opening and permitting smaller coins to pass by their momentum without being deflected, substantially as specified.

7. The coin-chute M, having opening *m* and projection *m*′ for automatically separating coins of the required size from smaller ones, substantially as specified.

8. The combination, with a coin-operated lever, of a coin-chute leading thereto, comprising a straight branch and a deflected branch communicating with each other, and a projection or device for deflecting coins of the required size into the branch leading to the coin-operated lever, substantially as specified.

9. The combination, with an electric motor, of an engine connected thereto, a circuit-breaking mechanism, also connected to said motor, an electric light, electric circuits and contact-pieces, a case having a coin-chute, and coin-operated lever for closing the electric circuit, substantially as specified.

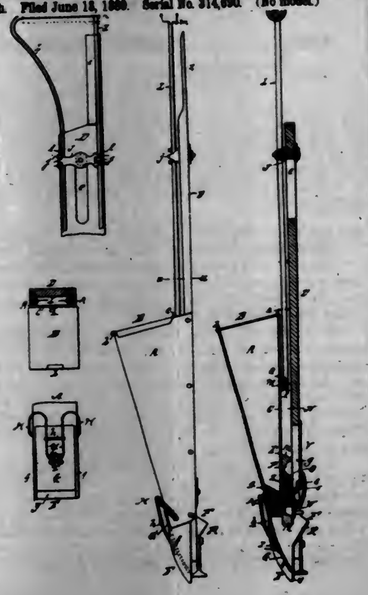
414,001. CAR-COUPLING. CHARLES A. ANDERSON, Rockford, Ill. Filed Aug. 15, 1889. Serial No. 320,573. (No model.)

Claim.—1. In a car-coupler, the combination of a draw-head, a coupling-pin supported above the link-opening, and a double-ended bar pivoted to the draw-head, one end entering the link-opening and the other end coming in contact with the coupling-pin when a link is inserted in the opening, thereby releasing the pin and causing it to descend, substantially as set forth.

2. In a car-coupler, the combination of a draw-head, a coupling-pin having its upper end pivoted with a rearward projection which engages an upward rising portion of the draw-head, and a double-ended bar pivoted to the draw-head, one end entering the link-opening and its other end coming in contact with the coupling-pin when a link is inserted in the opening, thereby disengaging the pin and permitting it to descend, substantially as set forth.

3. In a car-coupler, the combination of a draw-head, a coupling-pin supported above the link-opening, and a double-ended bar pivoted to the draw-head, one end entering the link-opening and its other end being weighted, thus holding it in position to be acted upon by one incoming link, substantially as set forth.

414,002. HORN FOR CAN-MACHINES. EDWIN R. ASDELL, Boston, assignor of one-half to E. B. Welch, Cambridge, Mass. Filed Jan. 29, 1889. Serial No. 298,006. (No model.)



Claim.—1. The combination, with a horn *a*, consisting of the uniformly-tapered inner portion 2 and the outer cylindrical portion 3, the latter having the slots *i*, of a reciprocating carrier within said horn, and inwardly-yielding spring-jaws pivoted to said carrier and having their outer ends working in said slots, as set forth.

2. The combination, with the fixed support *b*, of the horn *a*, having tapered and cylindrical portions, as shown, the arm *k*, the spring-pressed shank *n* at the outer end of said arm, and the guide *o*, carried by said shank above the cylindrical portion of said horn and provided with the beveled inner end *u*, as set forth.

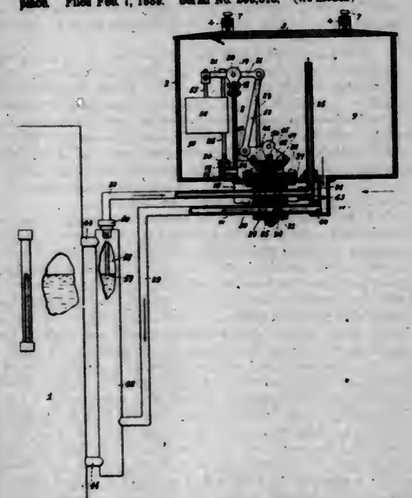
3. A horn having longitudinal slots, combined with a reciprocating carrier within the horn, pivoted jaws on said carrier projecting through said slots, and springs whereby the jaws are pressed outwardly, as set forth.

414,003. HAND CORN-PLANTER. SYLVESTER P. BABCOCK, Adrian, Mich. Filed June 13, 1889. Serial No. 314,090. (No model.)

Claim.—1. In a hand planter, the casting F F, consisting of the shoe *y*, sight-hopper R, separated upwardly-extending plunger, guide-arms *r r*, wings *f f*, and cross-piece S, connecting the upper end portions of said separated arms, substantially as shown and described.

2. In a hand planter, the combination of the standard D, provided with the slot *g*, the casting F F, provided with the separated upwardly-projecting plunger, and guide-arms *r*, connected by the cross-piece S and attached to the slotted part of the standard, substantially as shown and described.

3. In a hand planter, the combination of a plunger provided with upwardly-extending arms N N, said arms forming shoulders *q q* at their upper ends, a plate *n n*, connecting the upper ends of said arms and less in thickness than the depth of said arms, a stud Q, extending from near the center of said plate, and a handle having its looped lower end passing between said stud and said shoulders, substantially as shown and described.



4. In a hand planter, the combination, with a standard D, of the hopper A, having a rear wall C, provided with the slot E and located parallel to the standard and at a distance therefrom uniformly equal from end to end of the hopper to the thickness of the plunger, and a plunger sliding between the parallel standard and hopper-wall and bearing against and guided by the lower end of said wall, substantially as described.

5. In a hand planter, the hopper A, having an elastic rear wall C formed on its top edge, with a catch-stud *c*, in combination with the hinged lid B, substantially as described.

6. In a hand planter, the handle L L, formed of one rod bent near its center, then extending in parallel directions toward its ends, separating near the ends, and having one end bent and passed through an eye upon the other end and secured, said handle being provided with the offsets *l l*, and rod J, having studs *j j* bent down upon and embracing said handle at the offsets, substantially as shown and described.

7. In a hand planter, the combination of the standard D, the spring *i*, extending from the upper end of said standard, and a handle provided with a stud at its upper end adapted to engage with said spring, substantially as shown and described.

414,004. WATER-FEEDER FOR BOILERS. CHARLES A. I. BARRINGER, Baltimore, Md., assignor of one-half to Harry Fisher, same place. Filed Feb. 7, 1889. Serial No. 299,013. (No model.)

Claim.—1. The combination, with the boiler and the trap 2, of a pipe connecting the upper part of said trap with the upper part of the boiler and having a downwardly-projecting end adapted to be sealed by the boiler-water, a pipe connecting the lower part of the trap with the lower part of the boiler, a cock for closing said pipes, and a float in said trap for operating said cock, substantially as set forth.

2. The combination, with the boiler, the trap 2, and the supply-pipe 41, of a housing having ports communicating with the upper part of the boiler and upper part of said trap and ports communicating with the lower part of the boiler and the lower part of the trap and with said water-supply pipe, a plug in said housing having corre-

sponding ports, and a float in said trap for operating said plug, substantially as set forth.

3. The combination, with the boiler and the trap 2, of pipes 33 39, connecting the upper and lower parts of said trap with the upper and lower parts of the boiler, respectively, the extension 58 on said pipe 33 extending below the water-line of the boiler, a water-supply pipe connected to one of said pipes, a cock for shutting off either the water-supply or pipes from the boiler, and a float in said trap for operating said cock, substantially as set forth.

4. The combination, with the boiler and the trap, of pipes connecting the upper and lower parts of said trap with the upper and lower parts of the boiler, respectively, the cock-housing interposed in the length of said pipes, the supply-pipe connected to said housing, a plug in said housing for shutting off either the water-supply or the pipes from the boiler, a partition in said trap forming compartment 10 and having an aperture, a valve guarding said aperture, a float for operating said valve, and a float in said compartment for operating said plug, substantially as set forth.

5. The combination, with the boiler and trap 2, of pipes connecting said trap with the upper and lower portions of the boiler, a water-supply pipe communicating with one of said pipes, a cock for forming communication between either the supply-pipe and trap or the trap and the boiler, a partition in said trap forming compartments 9 10 and having an aperture, a valve guarding said aperture, a float in compartment 9 for operating said valve, and a float in compartment 10 for operating said cock, substantially as set forth.

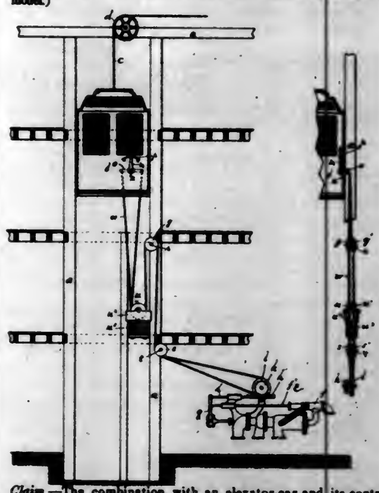
6. The combination, with the boiler and trap 2, having two compartments 9 10, connected by an aperture, of pipes connecting said compartment 9 with the upper and lower portions of the boiler, a water-supply communicating with one of said pipes, a cock for forming communication between either the supply-pipe and trap or trap and boiler, a valve guarding said aperture, the well or pit in compartment 9, having an outlet, a float in said well connected to said valve for actuating it, and a float in compartment 10 for operating said cock, substantially as set forth.

7. The combination, with the boiler, of the trap 2, having two compartments 9 10, connected by an upper and a lower aperture, a valve guarding said lower aperture, a well or pit in compartment 9, having an outlet, a float in said well connected to said valve for actuating it, pipes connecting compartment 9 with the upper and lower portions of the boiler, a supply-pipe communicating with one of said pipes, a cock for forming communication between either the supply-pipe and trap or trap and boiler, and a float in compartment 10 for operating said cock, substantially as set forth.

8. The combination, with the boiler, of the trap 2, having compartments 9 10, connected by an upper and a lower aperture, a valve guarding said lower aperture, the well 16, having an outlet in compartment 9, a float in said well connected to said valve for actuating it, pipes connecting compartment 9 with the upper and lower portions of the boiler, a partition 12, separating said pipes and valve from said well, a water-supply pipe communicating with one of said pipes, a cock for forming communication between either said supply-pipe and trap or the trap and boiler, and a float in compartment 10 for operating said cock, substantially as set forth.

9. The combination, with the boiler, of the trap 2, having compartments 9 10, connected by an upper and a lower aperture, a valve guarding said lower aperture, the well 16 in compartment 9, a float in said well for actuating said valve, pipes connecting the upper and lower portions of the boiler with said trap, the housing 26, with which said pipes connect, a supply-pipe connected to said housing, the compound plug 29 in said housing, a pipe 63, connecting well 16 with one of the pipes from the boiler, a valve in pipe 63, and a float in compartment 10 for actuating said plug 29, substantially as set forth.

10. The combination, with the boiler, of the trap 2, having compartments 9 10, connected by an upper and lower aperture, a valve guarding said lower aperture, the well 16 in compartment 9, a float in said well, a lever connected to said valve and float, the housing 26, having two series of ports 30 31 32 and 36 37 38, pipes 33 39, connecting the upper and lower portions of the boiler with ports 30 36, pipes 34 40, connecting ports 31 37 with the compartment 9, the supply-pipe 41, connected to port 38, a compound three-way plug in said housing, a pinion on said plug, a segment-rack engaging said pinion, a lever 21, connected to said rack, a float suspended from said lever 21 in compartment 10, a pipe 63, connecting well 16 with pipe 40, a valve in said pipe, and the stand-pipe 35, connected to pipe 34, as set forth.



11. The combination, with the boiler, of the trap 2, having compartments 9 10, connected by the lower aperture 14, a valve guarding said aperture, a float in compartment 9 for actuating said valve, the barrel 42, connected to the boiler, pipes connecting the upper and lower portions of said barrel with the upper and lower portions of the compartment 9, respectively, a supply-pipe, a compound cock having ports communicating with said pipe and an air-port, a partition isolating said well from said pipes and valve, a drain-pipe provided with a valve leading from said well, and a float in compartment 10 for actuating said compound cock, as set forth.

12. The combination, with the boiler, of the trap 2, having compartments 9 10, connected by the lower aperture 14, a valve guarding said aperture, a float in compartment 9 for actuating said valve, the barrel 42, connected to the boiler, pipes connecting the upper and lower portions of said barrel with the upper and lower portions of the compartment 9, respectively, a supply-pipe, a compound cock having ports communicating with said pipe and an air port, a partition isolating said well from said pipes and valve, a drain-pipe provided with a valve leading from said well, a float in compartment 10 for actuating said compound cock, and the extension 58, projecting down into said barrel, as set forth.

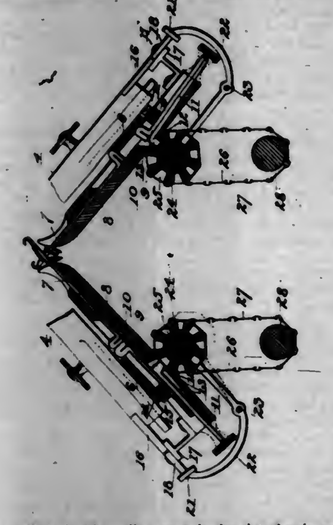
13. The combination, with the boiler and the trap 2, of the barrel 42, connected to said boiler, a water-supply pipe leading to said trap, the pipe 39, connecting said barrel with the lower part of said trap, the pipe 33, connecting the upper part of said trap with the upper end of said barrel, and the extension 58, extending down into said barrel, substantially as set forth.

414,005. VALVE-OPERATING MECHANISM FOR ELEVATORS.

CARL BERG, Buffalo, N. Y., assignor of one-half to the Howard Iron Works, same place. Filed June 30, 1888. Serial No. 278,673. (No model.)

Claim.—The combination, with an elevator-car and its controlling-valve, of a hand-lever attached to the car, a pair of weighted pulleys traveling up and down along the side of the shaft, the loose pulleys located just above the central point in the height of the shaft, the guide-pulleys arranged at or near the bottom of the shaft, the pulley connected with the change or reversing valve, and the flexible cord passing around these pulleys, as shown, and secured at its ends to the hand-lever on the side of the car, all operating substantially as herein described.

414,006. STRAIGHT-KNITTING MACHINE.



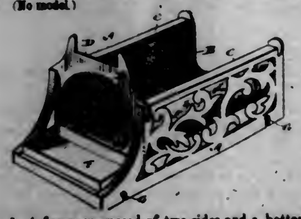
HERMANN RIESER, Philadelphia, Pa. Filed Oct. 17, 1888. Serial No. 288,404. (No model.)

Claim.—1. In a knitting-machine, the combination of a cam-carriage, a slide secured to said carriage, a bar operated upon by the slide, levers having their outer ends supporting said bar, and a roller carried by said levers, substantially as described.

2. In a knitting-machine, the combination of the needle-bed, the carriage carrying the cams, the bits having the feet adapted to be operated upon by said cams, the needles adapted to be in contact with said bits, the slide carried by the carriage, the bars or plates having the elongated slots, the levers abutting against said bars or plates, the rollers carried by said levers, and the bits having the feet adapted to engage the openings in the cards, all arranged and operating in the manner and for the purpose described.

3. A needle-bed with needle-grooves having slots therein, needles having feet, bits with feet projecting into said slots, bits resting on said first-named bits and having feet at their upper ends, said last-named bits adapted to move in the needle-grooves, a carriage provided with a cam adapted to engage said needles and said last-named bits, and means to raise the feet of the first-named bits, said parts being combined substantially as and for the purpose set forth.

4. A needle-bed with needle-grooves having slots therein, needles in said grooves, lower bits with downwardly-projecting feet in said slots, upper bits with upwardly-projecting feet in said needle-grooves, a spring-plate having blocks thereon adapted to depress said bits, a carriage provided with a cam for engaging said needles and upper bits, and means to raise the feet of the first-named bits, said parts being combined substantially as and for the purpose set forth



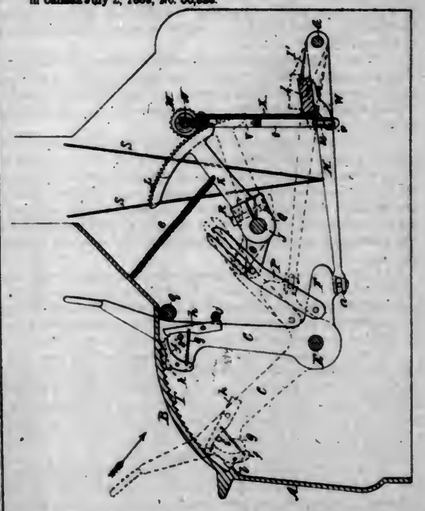
5. A needle-bed with needle-grooves having slots therein, needles having upwardly-projecting feet, bits having feet in said slots, bits on said first-named bits and having feet at their upper ends, a carriage provided with a cam adapted to engage said needles and last-named bits, and a roller adapted to carry a Jacquard pattern-chain, and means for raising, lowering, and rotating, said parts being combined substantially as described.

6. A needle-bed with needle-grooves having slots therein, needles in said grooves, bits having feet projecting in said slots, bits having upwardly-turned feet, a carriage provided with a cam adapted to raise said needles, bits having upwardly-turned feet, a slide secured to said carriage, a rail for said slides, a bar secured loosely to the needle-bed, and a shaft carrying rocking levers having their upper ends bearing against said bar and the other ends carrying a roller which is adapted to carry a Jacquard pattern-chain, said parts being combined substantially as and for the purpose set forth.

7. A knitting-machine having a grooved needle-bed with the slots 13 therein, needles in said grooves, the bits 11, with feet 12 projecting in said slots, the bits 9, resting on said bits 11 and provided with feet 10, the carriage 4, with cam 6, spring 14, and blocks 15, connected therewith, the slide 16, the longitudinal bar 18, having slots extending transversely thereof and secured to the carriage-bed, the shaft 23, with levers 22 thereon, the upper end 21 of said levers bearing against said bar 18, and roller 24 on the other ends of said levers, having recesses 25 and adapted to carry a Jacquard pattern-chain, said parts being combined substantially as and for the purpose set forth.

414,007. COMBINED BOOT SCRAPER AND WIPER.

CHARLES BORCHE, Toronto, Ontario, Canada. Filed Dec. 31, 1888. Serial No. 294,969. (No model.)



Claim.—1. A frame composed of two sides and a bottom, combined with a flexible detachable mat, of suitable material, inserted within it, so as to cover the interior of the said sides and bottom, substantially as and for the purpose specified.

2. A frame A, having sides with ribs C formed on them, in combination with a flexible detachable mat B, designed to cover the interior of the bottom and sides of the frame and butt against the ribs C, substantially as and for the purpose specified.

3. A frame A, having sides with ribs C formed on them, and a mat B, designed to cover the interior of the bottom and sides of the frame and butt against the ribs C, in combination with a scraper D, located at the end of the mat B, and having a hole through it, with a pliable wiper E projecting from one side of the said hole, substantially as and for the purpose specified.

414,008. CASH REGISTER AND INDICATOR.

ISRAEL D. BOYER, Dayton, Ohio, assignor to the National Cash Register Company, same place. Filed July 2, 1889. Serial No. 316,337. (No model.) Patented in Canada July 2, 1889, No. 30,226.

Claim.—1. In a cash register and indicator, the combination of a rack and an operating-key provided with a pawl which engages said rack during the stroke of the key in one direction and is disengaged therefrom during its stroke in the opposite direction, substantially as and for the purpose described.

2. In a cash register and indicator, the combination of a rack and an operating-key provided with a pawl which engages said rack during the registering-stroke of the key and is disengaged therefrom at the completion of said stroke, substantially as and for the purpose described.

3. In a cash register and indicator, the combination of a rack, an operating-key provided with a pawl which engages said rack during the registering-stroke of the key and is disengaged therefrom at the completion of said stroke, a latch for holding the pawl out of engagement with the rack during the opposite stroke of the key, and a trip for said latch, substantially as and for the purpose described.

4. In a cash register and indicator, the combination of a segment-rack and a pivoted operating-key which is engaged with said rack during its stroke in one direction and disengaged therefrom during its stroke in the opposite direction, substantially as and for the purpose described.

5. In a cash register and indicator, the combination of a segment-rack and a pivoted operating-key which is engaged with said rack during its registering-stroke and disengaged therefrom at the completion of said stroke, substantially as and for the purpose described.

6. In a cash register and indicator, the combination of a segment-rack and a pivoted operating-key provided with a pawl which engages said rack during the registering-stroke of the key and is disengaged therefrom at the completion of said stroke, substantially as and for the purpose described.

7. In a cash register and indicator, the combination of a segment-rack, a pivoted operating-key provided with a pawl which engages said rack during the registering-stroke of the key and is disengaged therefrom at the completion of said stroke, a latch for holding the pawl out of engagement with the rack during the opposite stroke

of the key, and a trip for said latch, substantially as and for the purpose described.

8. In a cash register and indicator, the combination of a rack and an operating-key, which is free from the rack during its registering-stroke and engaged therewith during its opposite stroke, substantially as and for the purpose described.

9. In a cash register and indicator, the combination of a rack, an operating-key provided with a pawl, a latch for holding the pawl out of engagement with the rack during the registering-stroke of the key, and a trip for said latch, substantially as and for the purpose described.

10. In a cash register and indicator, the combination of a segment-rack and a pivoted operating-key, which is free from the rack during its registering-stroke and engaged therewith during its opposite stroke, substantially as and for the purpose described.

11. In a cash register and indicator, the combination of a segment-rack, a pivoted operating-key provided with a pawl, a latch for holding the pawl out of engagement with the rack during the registering-stroke of the key, and a trip for said latch, substantially as and for the purpose described.

12. In a cash register and indicator, the combination of an operating-key and two stationary racks, with one of which the key is engaged during its stroke in one direction and with the other of which it is engaged during its stroke in the opposite direction, substantially as and for the purpose described.

13. In a cash register and indicator, the combination, with two stationary racks, of an operating-key provided with two pawls, one of which is free from both of the racks during the registering-stroke of the key and engaged with one of the racks during its opposite stroke and the other of which is engaged with the other of said racks during the registering-stroke of the key and is free from both of the racks during its opposite stroke, substantially as and for the purpose described.

14. In a cash register and indicator having a series of keys, the combination of a registering-shaft, a driving-pinion loose on said shaft, a clutch between said pinion and shaft, and a shifter for automatically disengaging the clutch at the completion of the registering stroke of an operated key, substantially as and for the purpose described.

15. In a cash register and indicator having a series of operating-keys, the combination of a registering-shaft, a driving-pinion loose on said shaft, a clutch between said pinion and shaft, a shifter for automatically disengaging the clutch at the completion of the registering-stroke of an operated key, a latch for holding the clutch out of engagement during the opposite stroke of the key, and a trip for said latch, substantially as and for the purpose described.

16. In a cash register and indicator having a series of operating-keys, the combination of a registering-shaft, a driving-pinion loose on said shaft, a clutch between said pinion and shaft, a movable bar extending across the keys and moved by the operation of any one of them, and a shifter actuated by said bar to automatically disengage the clutch at the completion of the registering-stroke of an operated key, substantially as and for the purpose described.

17. In a cash register and indicator having a series of operating-keys, the combination of a registering-shaft, a driving-pinion loose on said shaft, a clutch between said pinion and shaft, a movable bar extending across the keys and moved by the operation of any of them, a shifter actuated by said bar to automatically disengage the clutch at the completion of the registering-stroke of an operated key, a latch for holding the clutch out of engagement during the opposite stroke of the key, and a trip for said latch, substantially as and for the purpose described.

18. In a cash register and indicator, the combination of a series of operating-keys of different values, a rack actuated to different degrees by the operation of the different keys of said series, a registering-shaft, a driving-pinion loose thereon and meshing with the rack, a clutch between the pinion and shaft, and a shifter for automatically disengaging the clutch at the completion of the registering-stroke of an operated key, substantially as and for the purpose described.

19. In a cash register and indicator, the combination of a series of operating-keys of different values, a segment-rack actuated to different degrees by the operation of the different keys, a registering-shaft, a driving-pinion loose thereon and meshing with the segment-rack, a clutch between the pinion and shaft, a shifter for automatically disengaging the clutch at the completion of the registering-stroke of an operated key, a latch for holding the clutch out of engagement during the opposite stroke of the key, and a trip for said latch, substantially as and for the purpose described.

20. In a cash register and indicator, the combination of the rack T and operating-key C, carrying the pawl *f* and latch *h*, substantially as and for the purpose described.

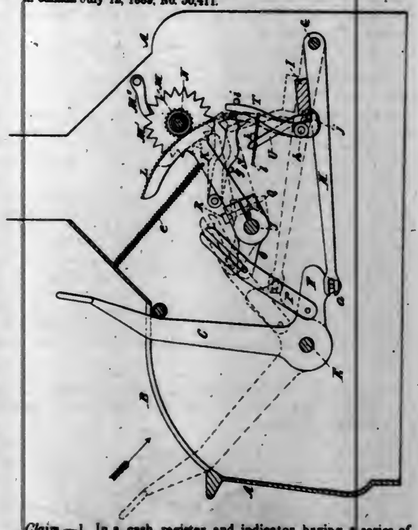
21. In a cash register and indicator, the combination of the rack T, operating-key C, pawl *f*, latch *h*, ledge *l*, and stop *j*, substantially as and for the purpose described.

22. In a cash register and indicator, the combination of the rack U and operating-key C, carrying the pawl *o* and latch *m*, substantially as and for the purpose described.

23. In a cash register and indicator, the combination of the rack U, operating-key C, pawl *o*, latch *m*, trip *p*, and stop *q*, substantially as and for the purpose described.

24. In a cash register and indicator, the racks T U, in combination with the key C, carrying the pawls *f o* and latches *h m*, substantially as and for the purpose described.

25. In a cash register and indicator, the slotted guide-plate B, provided with the racks T, one adjacent to each of the slots in said plate, in combination with the operating-keys C, which are engaged with said racks during their forward stroke and disengaged therefrom during their opposite stroke, substantially as and for the purpose described.



26. In a cash register and indicator, the slotted guide-plate B, provided with the racks U, one adjacent to each of the slots in said plate, in combination with the operating-keys C, which are free from said racks during their forward stroke and engaged therewith during their opposite stroke, substantially as and for the purpose described.

27. In a cash register and indicator, the slotted guide-plate B, provided with the racks T U, one of each adjacent to each of the slots in said plate, in combination with the operating-keys C, which are free from the rack U and engaged with the rack T during their forward stroke, and free from the rack T and engaged with the rack U during their opposite stroke, substantially as and for the purpose described.

28. In a cash register and indicator having a series of operating-keys, the combination of the segment-rack L, registering-shaft N, pinion M, loose on the shaft N and meshing with the rack L, the clutch between the pinion M and shaft N, shifter V, and bar I, which actuates the shifter V at the completion of the stroke of a key to disengage the clutch between the pinion M and shaft N, substantially as for the purpose described.

29. In a cash register and indicator having a series of operating-keys, the combination of the segment-rack L, registering-shaft N, pinion M, loose upon the shaft N and having clutch-teeth on one of its hubs, the clutch-hub *b*, tight on the shaft N, the shifter V, actuated by the bar I, the latch *y*, and the link X, engaged by the bar I to trip the latch *y*, substantially as and for the purpose described.

414,009. CASH REGISTER AND INDICATOR. ISRAEL D. BOYER, Dayton, Ohio, assignor to the National Cash Register Company, same place. Filed July 8, 1889. Serial No. 316,749. (No model.) Patented in Canada July 12, 1889, No. 50,411.

Claim.—1. In a cash register and indicator having a series of operating-keys of different values and a registering mechanism actuated to different degrees by the different keys of said series to register their respective values, the combination, with said registering mechanism, of a ratchet secured to a primary moving part thereof and a locking-dog which is engaged with said ratchet at the completion of the registering-stroke of an operated key and disengaged therefrom

at the completion of the opposite stroke of such key, substantially as and for the purpose described.

2. In a cash register and indicator having a series of operating-keys of different values and a registering mechanism actuated to different degrees by the different keys of said series to register their respective values, the combination, with said registering mechanism, of a ratchet secured to a primary moving part thereof, a locking-dog which is free from said ratchet during the registering-stroke of an operated key, means for engaging said dog with the ratchet at the completion of the registering-stroke of such key, a latch for holding the dog and ratchet in engagement during the opposite stroke of said key, and a trip for said latch operated at the completion of such opposite stroke of the key, substantially as and for the purpose described.

3. In a cash register and indicator having a series of operating-keys of different values and a registering-shaft actuated to different degrees by the operation of the different keys of said series to cause the registering mechanism to register their respective values, the combination, with said registering-shaft, of a ratchet and a locking-dog which is engaged with said ratchet at the completion of the registering-stroke of an operated key and disengaged therefrom at the completion of its opposite stroke, substantially as and for the purpose described.

4. In a cash register and indicator having a series of operating-keys of different values and a registering-shaft actuated to different degrees by the operation of the different keys of said series to cause the registering mechanism to register their respective values, the combination, with said registering-shaft, of a ratchet, a locking-dog which is free from said ratchet during the registering-stroke of an operated key, means for engaging said dog with the ratchet at the completion of the registering-stroke of such key, a latch for holding the dog and ratchet in engagement during the opposite stroke of said key, and a trip for said latch operated at the completion of such opposite stroke of the key, substantially as and for the purpose described.

5. In a cash register and indicator, the combination of a series of operating-keys of different values, a rack actuated to different degrees by the different keys of said series, a registering-shaft, a driving-pinion loose thereon and meshing with the rack, a clutch between the pinion and shaft, a ratchet on said shaft, and a locking-dog which is free from said ratchet during the registering-stroke of an operated key and engaged therewith during its opposite stroke, substantially as and for the purpose described.

6. In a cash register and indicator, the combination of a series of operating-keys of different values, a rack actuated to different degrees by the different keys of said series, a registering-shaft, a driving-pinion loose thereon and meshing with the rack, a clutch between the pinion and shaft, a ratchet rigidly secured to said shaft, and a locking-dog which is free from said ratchet during the registering-stroke of an operated key and engaged therewith during its opposite stroke, substantially as and for the purpose described.

7. In a cash register and indicator, the combination of a series of operating-keys of different values, a rack actuated to different degrees by the different keys of said series, a registering-shaft, a driving-pinion loose thereon and meshing with the rack, a clutch between the pinion and shaft, a ratchet rigidly secured to said shaft, a locking-dog which is free from said ratchet during the registering-stroke of an operated key, means for engaging said dog with the ratchet at the completion of the registering-stroke of said key, a latch for holding the dog and ratchet in engagement during the opposite stroke of said key, and a trip for said latch, substantially as and for the purpose described.

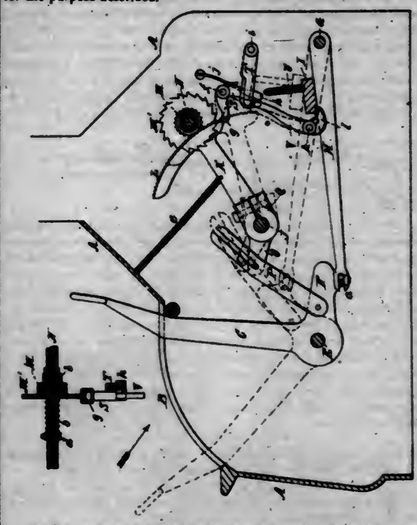
8. In a cash register and indicator, the combination of the operating-keys C, rack L, actuated thereby, shaft N, pinion M, loose on said shaft and meshing with the rack L, the clutch between said pinion and shaft, ratchet M′, locking-dog S, latch T, bar I, and arm U, substantially as and for the purpose described.

9. In a cash register and indicator, the combination of the keys C, levers H, rack L, arms O, rigid therewith, links P, shaft N, pinion M, the clutch between said pinion and shaft, ratchet M′, locking-dog S, latch T, bar I, and arm U, substantially as and for the purpose described.

414,010. CASH REGISTER AND INDICATOR. ISRAEL D. BOYER, Dayton, Ohio, assignor to the National Cash Register Company, same place. Filed July 8, 1889. Serial No. 316,750. (No model.) Patented in Canada July 12, 1889, No. 50,412.

Claim.—1. In a cash register and indicator having a series of operating-keys, the combination of a registering-shaft, a driving-pinion loose thereon, a clutch between said pinion and shaft, a ratchet secured to said pinion, and a pawl which is free from said ratchet during the registering-stroke of the operating-keys and engaged therewith during the opposite stroke of said keys, substantially as and for the purpose described.

2. In a cash register and indicator having a series of operating-keys of different values, a rack actuated to different degrees by the different keys of said series, a registering-shaft, a driving-pinion loose thereon and meshing with the rack, a clutch between the pinion and shaft, a ratchet rigidly secured to said shaft, and a locking-dog which is free from said ratchet during the registering-stroke of the operating-keys and engaged therewith during its opposite stroke, substantially as and for the purpose described.



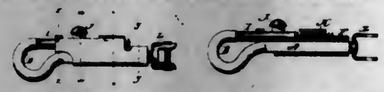
3. In a cash register and indicator, the combination of a series of operating-keys of different values, a rack actuated to different degrees by the operation of the different keys of said series, a registering-shaft, a driving-pinion loose thereon and meshing with the rack, a clutch between the pinion and shaft, a ratchet secured to the driving-pinion, and a pawl which is free from said ratchet during the registering-stroke of the operating-keys and engaged therewith during the opposite stroke of said keys, substantially as and for the purpose described.

4. In a cash register and indicator, the combination of a series of operating-keys of different values, a rack actuated to different degrees by the operation of the different keys of said series, a registering-shaft, a driving-pinion loose thereon and meshing with the rack, a clutch between the pinion and shaft, a ratchet secured to the driving-pinion, a pawl arranged to engage therewith, a latch for holding the pawl and ratchet out of engagement during the registering-stroke of the keys, and a trip for said latch, substantially as and for the purpose described.

5. In a cash register and indicator having a series of operating-keys of different values, the combination of the rack L, actuated to different degrees by the different keys of said series, the shaft N, pinion M, loose on said shaft, the clutch between said pinion and shaft, ratchet M′, secured to the pinion M, pawl *g* on the bell-crank S, latch T, and trip U, substantially as and for the purpose described.

6. In a cash register and indicator, the combination of the operating-keys C, levers H, rack L, arms O, rigid therewith, links P, registering-shaft N, pinion M, the clutch between said pinion and shaft, ratchet M′, pawl *g* on bell-crank S, latch T, bar I, trip U, and lever V, substantially as and for the purpose described.

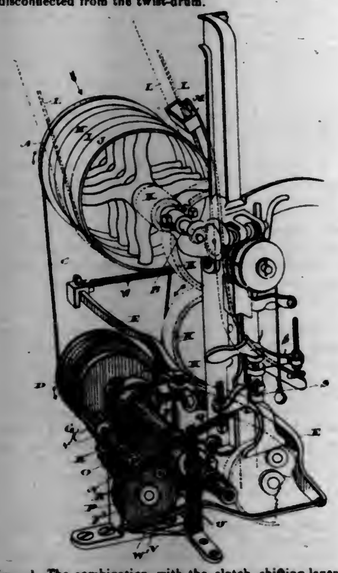
414,011. SNAP-HOOK. RICHARD A. BERRY, Bridgeport, Conn., assignor to the Bridgeport Chain Company, same place. Filed Apr. 1, 1889. Serial No. 305,903. (No model.)



Claim.—1. The herein-described snap-hook, consisting of a body and hook made from a single piece of wrought metal, combined with a blank of sheet metal closed around said body so as to embrace three sides thereof, leaving a space on the third side to form the bolt and spring-barrel parallel with and above the body, a bolt arranged in said barrel in line with and movable toward and from the nose of the hook, with a spring in said barrel the tendency of which is to hold the hook in the closed position, substantially as described.

2. In a snap-hook, the body and hook made from wire, combined with a barrel made from a blank of sheet metal closed around the body, the edges of the blank brought together and so as to form a barrel parallel with the body of the hook, a notch formed in the edge of the blank, and which, when the blank is closed around the

barrel, produces a longitudinal slot D, a bolt I, arranged in said barrel, the bolt constructed with a thumb-piece J extending through the said slot in the barrel, and a spring arranged in the barrel in the rear of the bolt, so as to yieldingly hold the bolt against the nose of the hook, substantially as described.

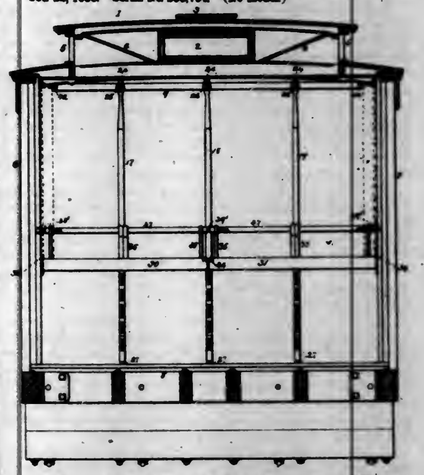


3. A snap-hook consisting of the body A and hook B, made of wire, combined with a barrel made from a blank of sheet metal closed around the body to form the barrel parallel with the body, the said blank constructed with an ear F at its rear end adapted to be closed upon the top of the body and in rear of the barrel, a bolt I, arranged in said barrel, and a spring also arranged in said barrel and resting against said ear F as a resistance, the said spring adapted to hold the bolt against the nose of the hook, substantially as described.

4. The body A and hook B, made from wire, combined with a blank closed around the said body to form the barrel, the blank constructed with a notch in its edge, which, when the blank is closed around the body and the edges of the blank brought together, will leave a longitudinal slot E into the barrel, the blank also constructed with a notch H at its forward end with inwardly-projecting ears *a*, the said ears turned inward over the body and so as to form a cylindrical end to the tubular barrel, a bolt arranged in the said barrel and extending through the said cylindrical end, the bolt provided with a thumb-piece J, arranged to work in the said slot E of the barrel, and a spring in the barrel at the rear of the bolt, the tendency of which is to yieldingly hold the bolt against the nose of the hook, substantially as described.

414,012. SPINNING-MULE. JOSEPH L. BROOK, Simcoe, Ontario, Canada. Filed Mar. 17, 1888. Serial No. 267,483. (No model.)

Brief.—The object of the invention is to prevent the backing-off clutch from being thrown into action until after the driving power has been disconnected from the twist-drum.



Claim.—1. The combination, with the clutch-shifting lever and clutch and a stop arranged to engage the lever and hold the clutch out of action, of the backing-off mechanism, the twist-slide, the flattened disk, means intermediate the disk and the stop to move the latter, a shaft operated from some moving part of the machine, a friction-roller on said shaft in contact with the disk, and the pivoted lever Q, engaging a stop on the disk and actuated by the twist-slide, as set forth, whereby the said mechanism fails to remove the stop from said lever till the power has been removed from the backing-off mechanism, substantially as and for the purpose specified.

2. A clutch-shifting lever E, a clutch, and a pivoted lever V, arranged to act as a stop for the clutch-shifting lever, combined with the twist-slide and the backing-off mechanism, the disk having flattened portion, the shaft N, friction-roller O thereon, roller U on the face of the disk, and the pivoted lever Q, one end engaging a stop on the disk and the other arranged to be actuated by the twist-slide, substantially as shown, and for the purpose specified.

3. The levers Q and V, the disk P, having a cam or a roller U, designed to engage with the lever V, a pin R, to engage with the lever Q, and a friction-pulley O, arranged to impart movement to the disk P, in combination with the rim-pulley D, clutch G, lever E, arm F, spring W, means for rotating said clutch G, and the twist-slide S, arranged to strike the lever Q, so that it will release the pin R and permit the roller U to strike the lever V, substantially as and for the purpose specified.

4. A pivoted lever Q, pin R, driving-pulley O, rim-pulley D, clutch G, lever E, arm F, spring W, and disk P, weighted on one side and having a portion of its periphery flattened to be held opposite to its driving-pulley O by the pivoted lever Q engaging with the pin R, in combination with means for rotating said clutch G, the twist-slide S, to act on the lever Q, and a cam or roller U, to act on the lever V, substantially as and for the purpose specified.

414,013. STOCK-CAR. GEORGE D. BURTON, Boston, Mass. Filed Oct. 22, 1888. Serial No. 288,784. (No model.)

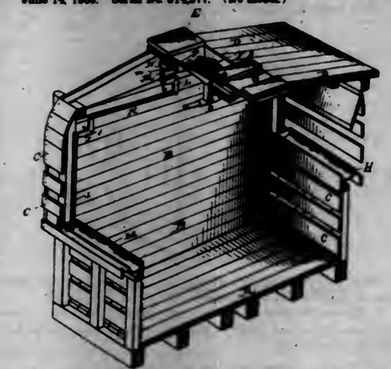
Claim.—1. A stock-car provided with longitudinal stalls and a breast-bar consisting of two sections and having securing devices whereby the outer ends of each section are attached to the side of the car and the inner ends of the two sections secured together, substantially as set forth.

2. A stock-car having longitudinal stalls and provided with a breast-bar in front of the stalls, consisting of a hollow bar or pipe and bolts sliding in the outer ends thereof to engage holes in the sides of the car, as set forth.

3. A stock-car having longitudinal stalls and a transverse feed-trough in front thereof, consisting of two sections hinged at their outer ends to the sides of the car and connected together at their inner ends, as set forth.

4. A stock-car having a feed-trough transversely placed, consisting of two sections hinged at the sides of the car, one section provided at its inner end with a bolt to enter and engage with a socket in the inner end of the other section, as set forth.

5. A stock-car having a feed-trough transversely placed, consisting of two sections attached at their outer ends to the sides of the car and having at their inner end a bolt on one section which engages in a socket in the other section, as set forth.



6. A stock-car having a feed-trough transversely placed, consisting of two sections having beaded edges supported at their outer ends against the sides of the car, and one section provided with a bolt sliding in the inner end of its bead and engaging with the bead of the inner end of the other section, as set forth.

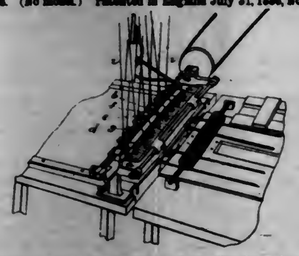
7. A stock-car provided with a feed-trough consisting of two sections hinged to the sides of the car, a breast-bar, and hinged hanger from the breast-bar to support the feed-trough, as set forth.

8. A stock-car having longitudinal stalls provided with a breast-bar in front thereof, a trough below said breast-bar, and brackets or hangers from the breast-bar for supporting the trough, as set forth.

9. In combination, a partition, a casting having eyes secured to said partition, a trough, the breast-bar, the hooks pivoted on the breast-bar and engaging the eyes of the casting, and hangers connecting the breast-bar and trough, as set forth.

414,014. STOCK-CAR. GEORGE D. BURTON, Boston, Mass. Filed June 14, 1888. Serial No. 314,377. (No model.)

Claim.—1. A stock-car provided with a pivoted feed-trough, a water-tank, a trap-door covering said water-tank, and levers connecting the feed-trough with the trap-door, whereby closing and opening the trap-door will cause the trough to be dumped and righted, as set forth.



2. A stock-car provided with a pivoted feed-trough, a water-tank, a trap-door located in the walking-plank on the roof of the car for covering said tank, and levers connecting said trough and trap-door, whereby the operating of the trap-door dumps and rights the trough, as set forth.

3. A stock-car provided with a pivoted trough set to dump laterally of the car, a tank, a hinged trap-door in the walking-plank to cover said tank, set to open longitudinally of the car, and levers connecting the trough and trap-door, whereby the movement of the trap-door longitudinally of the car and in the act of opening and closing causes the trough to be tilted upward and downward laterally of the car, as set forth.

4. In a stock-car, the combination of the pivoted trough, the crank-arm secured thereto, the tank, the trap-door covering said tank, and the links and elbow-levers connecting said crank-arm with the trap-door, for the purposes set forth.

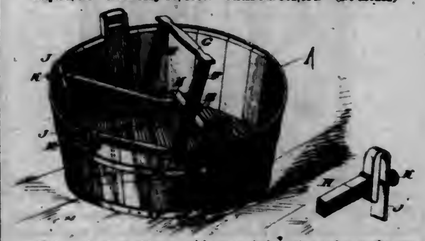
5. In a stock-car, the combination of the pivoted trough, the crank-arm secured thereto, the upright link, the elbow-lever pivoted to the end of the car, the link connecting them, the elbow-lever pivoted to move longitudinally of the car, the link connecting it with the aforesaid elbow-levers, the trap-door, and the link connecting the last-named elbow-lever with said door, for the purposes set forth.

414,015. MACHINE FOR COATING GLASS AND OTHER SURFACES WITH PHOTOGRAPHIC EMULSIONS. JAMES W. T. CADETT, Ashstead, County of Surrey, England. Filed June 25, 1888. Serial No. 278,193. (No model.) Patented in England July 31, 1886, No. 9,986.

Claim.—1. The combination, with the tank, of a series of emulsion-pumps provided with discharge-chutes, a crank for operating said pumps, and a traveling support for the plates, substantially as and for the purpose set forth.

2. The combination, with the tank having an inclined bottom for collecting sediment, of a series of emulsion-pumps having discharge-chutes projecting through the tank-bottom, a crank for operating the pumps, and a traveling support for the plates, substantially as and for the purpose set forth.

3. The combination, with the tank and the crank-shaft, of a series of emulsion-pumps detachably connected to said crank-shaft, whereby plates of different widths may be coated, and a traveling support for the plates, substantially as set forth.

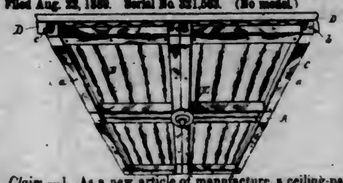


4. The combination, with the series of emulsion-pumps provided with discharge-chutes, of an inclined guide-plate pivotally supported below the chutes, and a traveling support for the plates, substantially as and for the purpose set forth.

5. The combination, with the series of emulsion-pumps provided with discharge-chutes, of a distributing-roller for evening the film of emulsion upon the surface of the plates, and a traveling support for the plates, substantially as set forth.

6. A distributing-roller for evening the film of emulsion upon uneven surfaces, formed of sections coupled by an india-rubber cord, substantially as set forth.

7. The combination, with the emulsion-tank and the series of pumps, of the inclined guide-plate pivotally supported below the discharges of said pumps, the distributing-roller supported by cords, for evening the film of emulsion, and a traveling support for the plates, substantially as and for the purpose set forth.

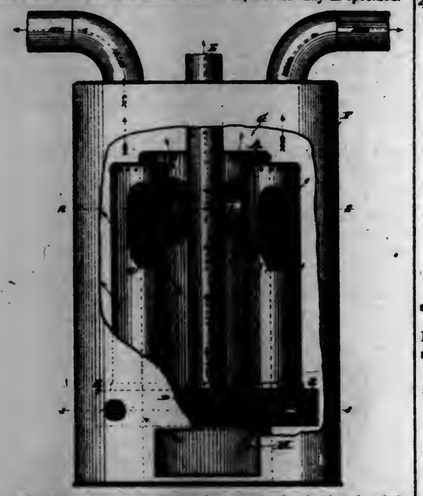


414,016. WASHING-MACHINE. CHARLES H. CADWALLADER, Philadelphia, Pa. Filed May 20, 1889. Serial No. 312,050. (No model.)

Claim.—1. A washing-machine consisting of a tub or other receptacle, the arms H, pivotally attached to the clamping devices J, the latter being adapted to embrace the sides of said tub, a rubber consisting of side bars and cross-slats, the levers F, pivotally attached to the arms H and to the said side bars of the rubber and having the handle G, the handle M, connecting the ends of the arm H, and the bottom B, said parts being combined substantially as described.

2. A washing-machine consisting of a tub, devices adapted to be removably secured to the sides of the tub and having arms pivoted thereto, a rubber consisting of side bars and cross-slats, a handle having levers secured thereto, the said levers being pivoted to the side bars of the rubber and to the arms of the said devices, the pivotal connection to the arms being in a position above the center of the sides of the rubber and the said arms having extensions secured together by a cross-piece, said parts being combined substantially as described.

414,017. METAL CEILING. FRANK G. CALDWELL, Wheeling, W. Va. Filed Aug. 22, 1889. Serial No. 321,563. (No model.)

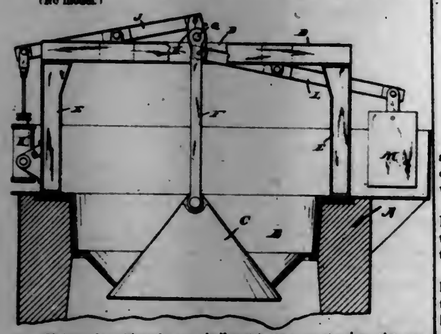


Claim.—1. As a new article of manufacture, a ceiling-panel composed of an open frame, a metal sheet or plate secured to one side of said frame, and a metal cap covering the exposed portion or side of said frame, substantially as described.

2. As a new article of manufacture, a recessed ceiling-panel composed of an open frame and a metal sheet or plate secured to one side of said frame and provided with a cap that covers the exposed side of the frame, substantially as described.

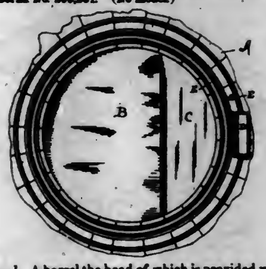
414,018. HOT-AIR FURNACE. FRASER M. CAMPBELL, St. Louis, Mo., assignor of one-half to William Thuener, same place. Filed Feb. 26, 1889. Serial No. 301,116. (No model.)

Claim.—1. In a furnace, the combination, with the hot-air chamber having an air-inlet in one side near its bottom, of the combustion-chamber situated eccentrically within the hot-air chamber and ad-



jacent to the side thereof opposite that having the air-inlet, the flues B B', extending from the inner side of the combustion-chamber near the top thereof, the descending flues C C', communicating at top with the flues B B', respectively, the chamber D, communicating with the lower ends of the flues C C', and the ascending flue E, rising centrally from the chamber between the flues B B', substantially as specified.

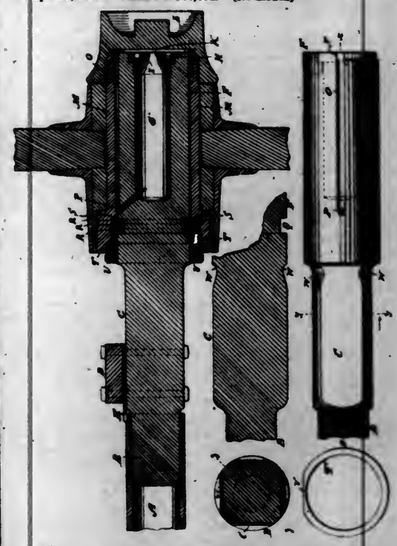
2. The combination, with the hot-air chamber having the air-inlet in one side near its bottom, of the combustion-chamber situated eccentrically within the hot-air chamber near the side opposite that having the air-inlet, the chamber D, immediately above the air-inlet, and provided with the air-ports *d' d'* at its lateral extensions, the flues B C and B' C', respectively connecting the said lateral extensions with the upper portion of the combustion-chamber, and the ascending flue rising from the chamber D midway between the flues C C', substantially as specified.



3. In a furnace, the combination, with the hot-air chamber and the combustion-chamber situated eccentrically therein, of the flues B B', extending from the top of the combustion-chamber, the descending flues C C', of large diameter, communicating, respectively, with the flues B B', the heating-chamber D, communicating with the lower ends of the flues C C', and the ascending flue E, rising from the chamber D between the flues C C' and of much smaller diameter than the latter flues, as and for the purposes set forth.

414,019. HOPPER MECHANISM FOR BLAST-FURNACES. JOHN G. CARLISLE, Philadelphia, Pa., assignor of one-half to Gordon, Strobel & Laureau, (Limited,) same place. Filed June 6, 1888. Serial No. 276,236. (No model.)

Claim.—In a blast-furnace bell and hopper mechanism, the combination, substantially as set forth, of a bell-rod connected with the apex of the bell, a horizontal pivot at the upper end of the bell-rod, a link pivoted at its center to said pivot and disposed substantially vertically when the bell and bell-rod are up, a centrally-pivoted motor-beam, a motor mechanism arranged to apply force to the outer end of said beam, a counterbalance-beam with its pivot out of the plane of the pivot of the motor-beam, a counter-balance arranged to apply force to the outer end of said beam, and pivots uniting the inner ends of said two beams with the ends of said link.



414,020. BARREL. DAVID G. CLEMOW, Peoria, Ill. Filed Feb. 6, 1889. Serial No. 299,261. (No model.)

Claim.—1. A barrel the head of which is provided with the raised section B, substantially as described.

2. A barrel the head of which is provided with the raised section B, and the raised block D, set in the body of the stave or staves, substantially as described.

414,021. VEHICLE-AXLE. JOHAN R. COLE, New York, N. Y., assignor to Lesfort Lesfortz and Fannie T. Cole, both of same place. Filed Apr. 19, 1889. Serial No. 307,651. (No model.)

Claim.—1. A vehicle-axle consisting of a bed portion, a neck, and a cylindrical arm of a diameter equal to the cornerwise thickness of the neck, said neck having a groove or depression at its juncture with the arm, substantially as described.

2. A vehicle-axle consisting of an arm F, a neck C, a bed portion B, and a bed A, adjustable along the bed portion, in combination with the spring D and the key E, extending along the axle-neck beneath the spring and engaging the axle-bed, substantially as described.

3. The axle having a cylindrical arm F, provided with the annular groove Q, and the washer R, located in said groove and held by the opposite side walls of the groove, in combination with the hub M, having the shoulder S and extending inward over the washer, and the nut U, located directly upon the inner end of the cylindrical axle-arm and engaging the hub, substantially as described.

4. The combination, with an axle-arm having a groove Q and a washer seated in said groove and made to project beyond the arm, of a hub seated on the arm and having a shoulder S, made to engage the washer, a nut U, for locking the hub and washer together, and an anti-friction ring T, interposed between the washer and nut, substantially as described.

5. The combination, with an axle-arm having a groove Q and a washer seated in said groove and made to project beyond the arm, of a hub seated on the arm and having a shoulder S, made to engage the washer, and a nut U for locking the hub and washer together, said washer and hub having flat faces or portions for preventing the hub turning independently of the washer, substantially as described.

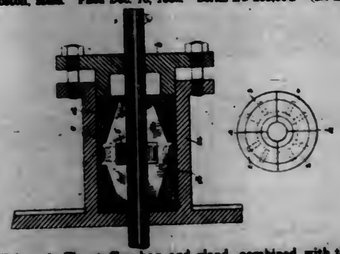
6. A vehicle-axle having its arm provided with an oil-chamber having a cap provided with a filling-opening I and discharge-opening K, said arm having a channel O and return-opening P, for leading the surplus oil to the chamber, substantially as described.

7. A vehicle-axle having its arm provided with an oil-chamber having a cap provided with a filling-opening I and discharge-opening K, said arm having a channel O, a return-opening P, and a shoulder N, for removing surplus oil from the hub, substantially as described.

414,022. METALLIC LINING FOR PUMPS. ELIJAH J. COLES, Liberty, Ohio. Filed Sept. 20, 1888. Serial No. 285,804. (No model.)

Claim.—A pump-stock provided with a tubular unbroken lining of malleable metal fitting snugly within the stock and provided at its ends with semicircular annular beads fitting snugly within corresponding shaped grooves in the stock and having their free edges lying flush with the bore of the same, the extreme ends of the said tube being of less diameter than the central part of the annular beads and of greater diameter than the bore of the pump-stock, substantially as set forth.

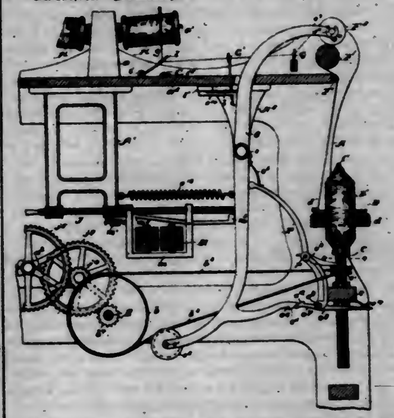
414,023. DISH-WASHING MACHINE. ROBERT H. CORBETT, St. John, Kans. Filed June 12, 1889. Serial No. 277,509. (Model.)



Claim.—1. The combination, with a cylinder provided with grooves *b* near its ends, of a pair of supports consisting each of a pair of prongs *a a*, which embrace the said cylinder and are provided with eyes at their upper ends, removable wire links *c*, passing over the top of the said cylinder and connecting the eyed ends of the prongs *a a*, and legs attached to the said prongs *a*, the said links and prongs resting in the said grooves in the cylinder, as and for the purpose described.

2. The combination of a cylinder A, a shaft *d*, journaled therein and carrying a gauze cylinder, and sponges secured to this shaft in the said gauze cylinder, as and for the purposes described.

3. The combination of a stationary cylinder, a shaft journaled therein and carrying a reticulated cylinder, this shaft being provided with holes for the passage of a sponge-securing wire *d'*, and said wire and sponges, substantially as described.



414,024. PACKING FOR PISTON-RODS. DANIEL W. CROSBY, Boston, Mass. Filed Dec. 10, 1888. Serial No. 293,094. (No model.)

Claim.—1. The stuffing-box and gland, combined with the perforated rocking metallic sectional tube surrounding the rod, the cork filling, and the absorbent material, substantially as described.

2. The stuffing-box and gland, combined with the metallic sectional tube surrounding the rod, made larger in diameter at the middle than at its ends and having the internal steam-receiving chamber 5, the perforations leading therefrom, the chambered projection 6, the cork packing surrounding said metallic tube, and the absorbent material in the chamber of the projection 6, substantially as described.

414,025. ELECTRIC STOP-MOTION FOR TWISTING-MACHINES, &c. VICTOR I. CUSHMAN, Lowell, Mass. Filed Aug. 14, 1888. Serial No. 280,740. (No model.)

Claim.—1. The combination of an electric circuit containing a circuit-closer normally held open by the work, but automatically closed upon the failure of the work, a lever, a reciprocating bar or rod, an electro-magnet arranged in said circuit, and its armature arranged, when attracted, to move between said reciprocating rod and lever, and thereby to occasion the movement of said lever, the bottom roll, and the top roll supported upon said lever and adapted by the movement of said lever to be raised out of contact to stop the feed of the work between the rolls, as and for the purpose specified.

2. The combination of a spindle, a brake-lever, an electric circuit containing a circuit-closer normally held open by the work, but automatically closed upon a failure of the work, another lever, a reciprocating bar or rod, and an electro-magnet arranged in said circuit, its armature arranged, when attracted, to move between said reciprocating rod and said last-named lever, and thereby to move said lever and to cause said brake-lever to press upon said spindle and stop its rotation, as and for the purpose specified.

3. The combination of a band-cylinder, a spindle, a loose band connecting said cylinder and spindle, a lever and an idle-pulley supported upon said lever and normally pressing against said band, an electric circuit containing a circuit-closer normally held open by the work, but automatically closed upon the failure of the work, a reciprocating rod or bar, and an electro-magnet arranged in said circuit, its armature arranged, when attracted, to move between said reciprocating rod and lever, and thereby to move said lever and loosen said band and allow the spindle to stop, as and for the purpose specified.

4. The combination of an electric circuit containing a circuit-closer normally held open by the work, but automatically closed upon a failure of the work, a band-cylinder, a spindle provided with a whirl, a loose band or belt connecting said band-cylinder and whirl, a lever, an idle-pulley supported upon said lever and normally pressing against said band to strain the same and to cause said spindle and whirl to be rotated by the rotation of said band-cylinder, a reciprocating bar or rod, and an electro-magnet arranged in said circuit, its armature arranged, when attracted, to move between said reciprocating rod and said lever and to be pushed by said rod against said lever to rock said lever and loosen said band and allow said spindle to stop, as and for the purpose specified.

5. The combination of an electric circuit containing a circuit-closer normally held open by the work, but automatically closed upon a failure of the work, a band-cylinder, a spindle provided with a whirl, a loose belt or band connecting said band-cylinder and whirl, a lever, an idle-pulley supported upon said lever and normally pressing against said band to strain the same and to cause said spindle and whirl to be rotated by the rotation of said band-cylinder, a reciprocating bar or rod, an electro-magnet arranged in said circuit, its armature arranged, when attracted, to move between said reciprocating

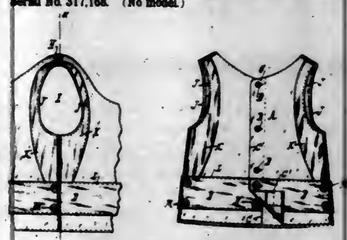
rod and said lever and to be pushed by said rod against said lever, and thereby to rock said lever and loosen said band, and a brake-lever, one arm of which extends over said whirl, but is normally out of contact therewith, and the other arm of which brake-lever is arranged in contact with said first-named lever, whereby the rocking of said first-named lever will cause said brake-lever to press upon said whirl and to stop the rotation of said whirl and spindle, as and for the purpose specified.

6. The combination of an electric circuit containing a circuit-closer normally held open by the work, but automatically closed upon a failure of the work, a band-cylinder, a spindle provided with a whirl, a loose belt or band connecting said band-cylinder and whirl, a lever, an idle-pulley supported upon said lever and normally pressing against said band to strain the same and to cause said spindle and whirl to be rotated by the rotation of said band-cylinder, a reciprocating bar or rod, an electro-magnet arranged in said circuit, its armature arranged, when attracted, to move between said reciprocating rod and said lever and to be pushed by said rod against said lever, and thereby to rock said lever and loosen said band, a brake-lever, one arm of which extends over said whirl, but is normally out of contact therewith, and a spring secured to said first-named lever and holding the other arm of said brake-lever in contact with said first-named lever, whereby the rocking of said first-named lever will cause said brake-lever to press upon said whirl and to stop the rotation of said whirl and spindle, as and for the purpose specified.

7. The combination of an electric circuit containing a circuit-closer normally held open by the work, but automatically closed upon a failure of the work, a band-cylinder, a spindle provided with a whirl, a loose belt or band connecting said band-cylinder and whirl, a lever, an idle-pulley supported upon said lever and normally pressing against said band to strain the same and to cause said spindle and whirl to be rotated by the rotation of said band-cylinder, a reciprocating bar or rod, an electro-magnet arranged in said circuit, its armature arranged, when attracted, to be moved between said reciprocating rod and said lever and to be pushed by said rod against said lever to rock the same and loosen said band and allow said spindle to stop, the bottom roll, and the top roll supported upon said lever and turned by frictional contact with said bottom roll or with the work passing between said rolls, and adapted by the rocking of said lever to be moved out of such contact to stop the feed of the work, as and for the purpose specified.

8. The combination of an electric circuit containing a circuit-closer normally held open by the work, but automatically closed upon a failure of the work, a band-cylinder, a spindle provided with a whirl, a belt or band connecting said band-cylinder and whirl, a reciprocating rod, a brake-lever, one arm of which extends over said whirl, but is normally out of contact therewith, an electro-magnet arranged in said circuit, its armature arranged to move, when attracted, into the path of said reciprocating rod and to be carried along with said rod and to cause said brake-lever to press upon said whirl and to stop the rotation of said spindle and whirl, and a switch arranged in said circuit and normally closed, but opened upon the rocking of said lever, as and for the purpose specified.

9. The combination of an electric circuit containing a circuit-closer normally held open by the work, but automatically closed upon a failure of the work, a band-cylinder, a spindle provided with a whirl, a belt or band connecting said band-cylinder and whirl, a lever, a reciprocating rod, an electro-magnet arranged in said circuit, its armature arranged, when attracted, to move between said reciprocating rod and said lever and to be pushed by said rod against said lever and to rock the same, the bottom roll, the top roll, supported upon said lever and turned by frictional contact with said bottom roll or with the work passing between said rolls, and adapted by the rocking of said lever to be moved out of such contact to stop the feed of the work, and a switch arranged in said circuit and normally closed, but opened by the rocking of said lever, as and for the purpose specified.



10. The combination of an electric circuit containing a circuit-closer normally held open by the work, but automatically closed upon a failure of the work, a band-cylinder, a spindle provided with a whirl, a loose belt or band connecting said band-cylinder and whirl, a lever, an idle-pulley supported upon said lever and normally pressing against said band to strain the same and to cause said spindle and whirl to be rotated by the rotation of said band-cylinder, a reciprocating bar or rod, an electro-magnet arranged in said circuit, its armature arranged, when attracted, to move between said reciprocating rod and said lever and to be pushed by said rod against said lever to rock said lever and loosen said band and allow said spindle to stop, and a switch arranged in said circuit and normally closed, but opened by the rocking of said lever, as and for the purpose specified.

11. The combination of a lever, a bottom roll, a top roll supported upon said lever, said lever being provided with a hook, and the catch-lever adapted to engage said hook and to hold said top roll out of contact with said bottom roll or out of contact with the work between said top roll and bottom roll, as and for the purpose specified.

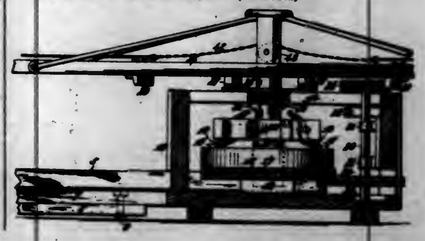
12. The combination of the band-cylinder, the spindle provided with a whirl, a loose belt or band connecting said band-cylinder and said whirl, a lever provided with a hook, an idle-pulley supported upon said lever and normally pressing against said band to strain the same and to cause said spindle to be rotated by the rotation of said band-cylinder, and a catch-lever adapted to engage said hook on said lever to hold said idle-pulley from straining said band, as and for the purpose specified.

13. The combination of the lever provided with a hook, the brake-lever having one arm in engagement with said first-named lever, a spindle provided with a whirl arranged below the other arm of said brake-lever, and a catch-lever adapted to engage said hook and to hold said last-named arm of said brake-lever in contact with said whirl, and thereby to prevent the rotation of said whirl and spindle, as and for the purpose specified.

414,026. UNDERWAIST. HELEN D. DE BEVOISE, Long Island City, and CHARLES R. DE BEVOISE, Flushing, N. Y. Filed July 11, 1889. Serial No. 317,168. (No model.)

Claim.—An underwaist provided with a surrounding band and having its upper portion provided with shoulder-straps which are overlaid by a continuous re-enforcing band surrounding the armhole and extended down the side of the waist under the armhole and stitched at the surrounding band.

414,027. BALANCED SLIDE-VALVE. HENRY D. DUNBAR, North Hartland, Vt. Filed July 22, 1889. Serial No. 318,223. (No model.)



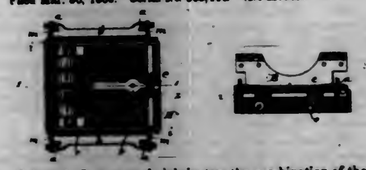
Claim.—1. The valve having in the back an inner chamber communicating with the exhaust-passage and an outer chamber containing packing-strips, said inner and outer chambers presenting an area in excess of that of the exhaust-chamber of the valve and both being in communication with the exhaust-chamber, substantially as specified.

2. The combination of the valve having inner and outer chambers formed in the back of the same, with packing-strips adapted to said outer chamber and free to move laterally therein to a slight extent, so as to permit steam to pass from the central chamber to the outer chamber behind the packing-strips, substantially as specified.

3. The combination of the body of the valve and the packing-strips at the back of the same with an angular frame secured to the body of the valve and forming with the same a chamber for the reception of said packing-strips, substantially as specified.

414,028. PRESS. CHARLES A. ERICKSON, Red Wing, Minn. Filed Dec. 19, 1888. Serial No. 294,056. (No model.)

Claim.—1. In a hay, cotton, or other press, the combination, with a suitable press mechanism, the box of which is connected to the frame of a horse-power, of a plunger-bar, a wheel having lugs, a segment of gear-teeth and a crank-pin to which the plunger-bar is connected, a main shaft on which the wheel is loosely mounted, said shaft carrying a cross-head having dogs which normally engage the lugs on the wheel, a gear meshing with the segment of gear-teeth, a shaft carrying said gear and having a pinion at its upper end, a cross-head revolving the main shaft and having racks by which reverse rotation is imparted to the pinion, gear, and wheel, and tripping cams or blocks arranged on a part of the horse-power frame above the dogs for tripping the latter prior to the action of the racks, substantially as described.



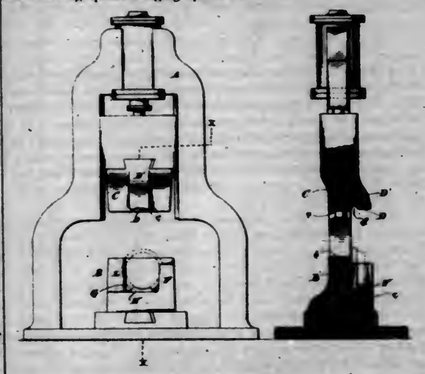
2. In a hay, cotton, or other press, the combination, with a plunger-bar, of a horse-power frame, a wheel having lugs, a segment of gear, and a crank-pin to which the bar is connected, a cross-head having dogs normally engaging the lugs on the wheel, a gear meshing with the segment of gear-teeth on the wheel, a shaft carrying said gear and having a pinion at its upper end, a cross-head by which motion is communicated to the cross-head carrying the dogs, the former having segmental racks by which reverse rotation is imparted to the pinion, gear, and wheel, and tripping cams or blocks arranged on a part of the horse-power frame above the dogs, and by which the latter are tripped and released from engagement with the lugs on the wheel, substantially as described.

3. In a hay, cotton, or other press, the combination, with a horse-power frame and a plunger-bar, of a wheel having lugs, a segment of gear, and a crank-pin by which the bar is reciprocated, a cross-head carrying dogs engaging the lugs on the wheel, a gear meshing at each part revolution with the segment of gear-teeth on the wheel, a shaft carrying said gear and having a pinion at its upper end, a main shaft, a cross-head on the main shaft having racks which mesh at each half-revolution with the pinion, tripping cams or blocks arranged on a part of the horse-power frame above the dogs, and elastic arms and slotted bearings supporting the shaft which carries the pinion and the gear, substantially as described.

4. In a hay, cotton, or other press, the combination, with a horse-power frame and a main shaft, of a plunger-bar, a wheel loosely mounted on the shaft and having lugs, a segment of gear-teeth, and a crank-pin to which the bar is connected, a cross-head on the main shaft having dogs which normally engage the lugs on the wheel, a gear and a pinion on a separate shaft, the gear meshing with the segment of gear-teeth on the wheel, a cross-head on the main shaft having racks which mesh at each half-revolution with the said pinion, tripping cams or blocks arranged on a part of the horse-power frame above the dogs to trip the latter, rock-shafts on opposite sides of an opening in the press-box, said shafts having packer-arms, and connecting-bars operated by a cross-head on the plunger-bar and connected to actuating-levers on the rock-shafts, substantially as described.

5. The combination of the plunger and the lengthwise-reciprocating plunger-bar 5, having a cross-head 37, with the press-box having a top feed-opening, a rock-shaft 32, journaled directly on the press-box at one side of the feed-opening, a series of packer-arms 34, rigidly fixed to the rock-shaft, a lever-arm 35, rigidly secured to and depending from the end of the rock-shaft at one side of the press-box, and a connecting-bar 36, pivoted at one end to said depending lever-arm and at the other end to the cross-head on the lengthwise-reciprocating plunger-bar, substantially as described.

414,029. CAR-AXLE LUBRICATOR. RUDOLPH FAAS, Chicago, Ill., assignor to the Standard Car Axle Lubricator Company, same place. Filed Mar. 30, 1889. Serial No. 305,444. (No model.)



Claim.—1. In a car-axle lubricator, the combination of the base H, sides *i i*, brackets *m m*, forming bearings for the bars *b b*, supported by the springs *a a*, affixed to the brackets *m m*, and the vertical metal shield B, tipped with leather, canvas, or other firm yielding material, as and for the purpose above specified.

2. The combination of the metal bars *b b*, springs *a a*, brackets *m m*, and metal shield B, tipped with leather, canvas, or other yielding material, as and for the purpose above specified.

414,030. STEAM-HAMMER FOR FORGING STEEL WHEELS. JAMES A. FACER, Philadelphia, Pa. Filed May 8, 1889. Serial No. 310,026. (No model.)

Claim.—1. In a steam-hammer for forging wheels, a hammer-die having a projection upon one face thereof, in combination with an anvil-die provided with a laterally-extending support for the periphery or tread of the wheel-blank to hold said blank in an upright position against the side or face of the anvil and permit it to be turned during the rounding-up and flanging operation.

2. In a steam-hammer for forging wheels, a hammer-die having a projection upon one face thereof, in combination with an anvil-die provided with a laterally-extending support for the periphery or tread of the wheel-blank at the base and face to hold said blank in an upright position against the side or face of the anvil and permit it to be turned during the rounding-up and flanging operation.

3. In a steam-hammer for forging wheels, a hammer-die having a projection upon one face thereof, having a curved under surface, in combination with an anvil-die provided with a laterally-extending support for the periphery or tread of the wheel-blank to hold said blank in an upright position against the side of the anvil and permit it to be turned during the rounding-up and flanging operation.

4. In a steam-hammer for forging wheels, a hammer-die having a projection upon one face thereof, having a curved and grooved under surface, in combination with an anvil-die provided with a laterally-extending support for the periphery or tread of the wheel-blank to hold said blank in an upright position against the side or face of the anvil and permit it to be turned during the rounding-up and flanging operation, provided with a groove for receiving the flange on the periphery of the blank.

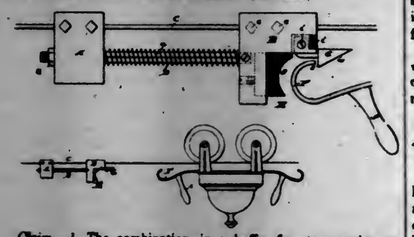
5. In a steam-hammer for forging wheels from solid ingot-blooms, the combination of a hammer and an anvil-die having flat surfaces to flatten and drive a punch into the bloom, a projection upon said hammer-die, and laterally-projecting supports upon the base of the anvil-die to support the flattened blank in an upright position against the face of the anvil-die for the purpose of rounding it up.

6. Dies for forging steel wheels, consisting of an anvil-die having a smooth or flat upper surface and a vertical front portion provided at a point below the upper surface with a grooved support for the flange of the wheel-blank, in combination with a hammer-die having an under face corresponding in area to the face of the anvil-die, and a front projection above the support of the anvil-die and having its under surface to correspond to the flange of the wheel-blank.

7. Dies for forging steel wheels, consisting of an anvil-die having a smooth or flat surface and a vertical front portion provided at a point below the upper surface with a grooved support for the flange of the wheel-blank and a lateral support secured to the anvil-die and arranged to one side of the grooved support to hold the wheel-blank from moving laterally, in combination with a hammer-die having an under face corresponding in area to the face of the anvil-die, and a front projection above the said lateral support secured to the anvil-die and having its under surface shaped to correspond to the flange of the wheel-blank.

8. Dies for forging steel wheels, consisting of an anvil-die having a smooth or flat upper surface and a vertical front portion provided at a point below the upper surface with a grooved support for the flange of the wheel-blank and a lateral support to the anvil-die and arranged to one side of the grooved support to hold the wheel-blank from moving laterally, and detachable pins secured to the anvil-die laterally with respect to the grooved support and on the side opposite to the lateral support, in combination with a hammer-die having an under face corresponding in area to the face of the anvil-die, and a front projection above the support of the anvil-die and having its under surface shaped to correspond to the flange of the wheel-blank.

414,031. PROCESS OF MANUFACTURING METALLIC WHEELS. James A. Facer, Philadelphia, Pa. Filed May 6, 1889. Serial No. 310,087. (No model.)



Claim.—1. The herein-described process of making forged wheels, which consists in first subjecting an ingot or bloom in a heated condition to forging operations to reduce it to approximately the proper thickness, then placing it between dies in an upright position, or in a position parallel to the line of action of said dies, and subjecting it to forging operations between said dies, turning it under them and rounding it up into approximately the shape of the finished wheel, and finally subjecting it to pressure between finishing-dies, forging its entire surface into the finished form.

2. The herein-described process of making forged wheels, which consists in first subjecting an ingot or bloom in a heated condition to forging operations to reduce it to approximately the proper thickness, then placing it between dies in an upright position, or in a position parallel to the line of action of said dies, and subjecting it to forging operations between said dies, turning it under them and rounding it up into approximately the shape of the finished wheel, simultaneously forming the flange upon the bloom while in said upright position by the forging operation, and finally subjecting it to pressure between finishing-dies, forging its entire surface into the finished form.

3. The herein-described process of making forged wheels, which consists in first subjecting an ingot or bloom in a heated condition to forging operations to reduce it to approximately the proper thickness, then placing it between dies in an upright position, or in a position parallel to the line of action of the dies, and subjecting it to forging operations between said dies, turning it under them and rounding it up into approximately the shape of the finished wheel, simultaneously forming the flange upon the bloom while in said upright position by the forging operation, then punching the axle-hole through its center, and finally subjecting it to pressure between finishing-dies, forging its entire surface into the finished form.

4. The herein-described process of making forged wheels, which consists in first flattening a heated bloom to approximately the proper thickness, then placing the bloom on end and rounding it up and forming the flange by turning it under forging-dies, then reheating the rounded and flanged bloom, then placing it on end and tapping it slightly to remove scales and dirt, and finally subjecting the bloom so shaped to finishing-dies, forging the bloom into its finished shape.

414,032. STORE-SERVICE BUFFER. Theodore P. Farmer, Boston, Mass., assignor to the Lamson Cash Railway Company, same place. Filed Feb. 12, 1885. Serial No. 156,422. (No model.)

Claim.—1. The combination, in a buffer for store-service apparatus, of the stationary section A, movable section B, provided with an elastic bearing E, and a pivoted dog having a shoulder *s* and an interposed spring, substantially as specified.

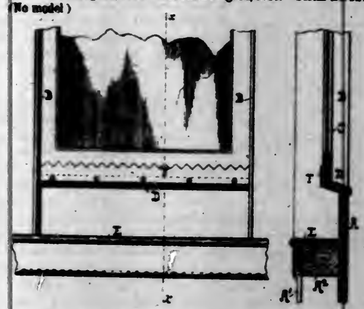
2. The combination, in a buffer for store-service apparatus, of a section A and means for securing it to the wire, the movable section B, provided with an elastic bearing E, and a pivoted spring-seated dog G, a spring interposed between said sections, and an arm or rod *a*, provided with a head or bearing *b*, substantially as specified.

3. The combination, with the car having a movable catch provided with a handle, of the stop carrying a pivoted dog having an inclined face *w* and an elastic bearing E, substantially as described.

4. The combination, in a buffer for store-service apparatus, of the stationary section, the movable section provided with an elastic bearing, a pivoted dog having a locking shoulder, and a spring interposed between the sections, and a carrier provided with a catch, and a handle secured to the latter, substantially as described.

414,033. PROCESS OF MAKING SILICIUM COPPER. Walther Feld and Georg von Knorre, Charlottenburg, Germany. Filed Nov. 12, 1888. Serial No. 290,604. (No specimens.)

Claim.—The production of silicium copper by smelting a mixture or mingling of copper or cupric oxide with coal or tar and fossil-meal with substances discharging chlorine or fluorine (such as common salt, chloride of copper, chloride of magnesium, chloride of potassium, chloride of calcium, &c., or fluor-spar, &c.) in a reverberatory furnace or in a shaft furnace.



414,034. GAGE-COCK. John G. Fendley, Wallaceburg, Ontario, Canada. Filed June 29, 1889. Serial No. 316,023. (No model.)

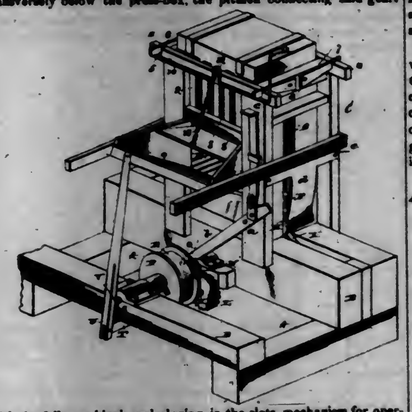
Claim.—1. In a gage-cock, the combination of a hollow stem, a head pivoted to said stem, and a rotary plug having separate and independently-removable packing-strips on two sides thereof, substantially as shown and described.

2. In a gage-cock, the combination, with the stem F, having therein the bore G, of the head C, pivoted to said stem and having therein the cylinder D, and the rotary plug A, carrying the separate and independently-removable packing-strips B B, substantially as shown and described.

414,035. RAILWAY-CAR BODY. Matthias H. Forney, New York, N. Y. Filed Aug. 26, 1886. Renewed Aug. 24, 1889. Serial No. 321,850. (No model.)

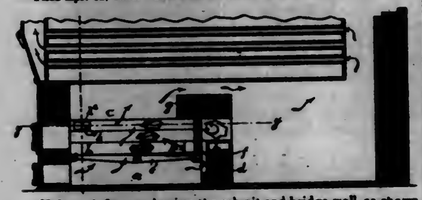
Claim.—1. In a railway-car, an arm-rest formed by removing a portion of the inner casing of the car below and under the window-sash and between two of the studs, which studs, together with the inner and outer casings, form the side of the car, substantially as specified.

2. In a railway-car, a portion of the side of the car below the window-sash reduced in thickness from the inner side of the car, the cavity thus formed extending under the said sash, whereby an arm-rest is formed, substantially as specified.



414,036. BALING-PRESS. Domenico Fontebasso, Belton, Tex. Filed Mar. 13, 1889. Serial No. 303,072. (No model.)

Claim.—1. The combination of the vertical press-box, the follower-block moving therein, the intermeshing segmental gears arranged below the press-box and connected with the follower-block to operate the same, the shaft N, having a fixed disk Q, the band-pulley loosely mounted on said shaft adjacent to said disk, the disk P, loosely mounted on said shaft and adapted to bind the band-pulley against the disk Q, the pivoted lever adapted to shift the disk P, and gearing between the shaft N and the segmental gears, as set forth.



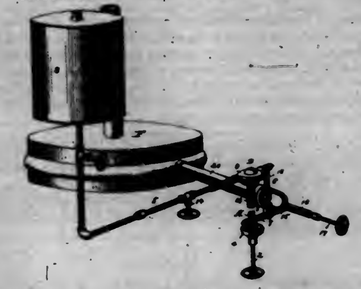
2. The combination of the main frame, the longitudinal shaft N, the pinion M on said shaft, the detent pivoted on the frame and having a series of notches in its end adapted to engage the teeth of the pinion, and the vertically-sliding bar mounted on the frame and pivoted to the detent, all arranged and operating substantially as and for the purposes set forth.

3. The combination of the vertical press-box having a feed-opening in its side, the chute projecting from the press-box and leading to said opening, the upwardly-swinging gate in the lower end of the chute adapted to cover the feed-opening, the horizontal rock-shaft mounted on the side of the press-box above the gate and having a central crank-arm, and the chain connecting said crank-arm with the gate, as set forth.

4. The combination of the press-box having vertical slots in its sides, the follower-block moving therein, the segmental gears arranged transversely below the press-box, the pitmen connecting said gears with the follower-block and playing in the slots, mechanism for operating said gears, and the springs mounted on the press-box and bearing on the pitmen, as set forth.

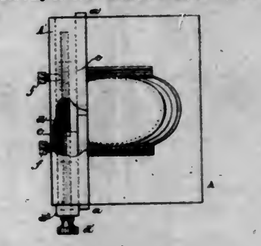
414,037. FURNACE. George F. Gallagher and Thomas B. Moore, Rochester, N. Y., assignors of one-sixth to Henry Gallagher, same place. Filed Apr. 12, 1889. Serial No. 306,957. (No model.)

Claim.—A furnace having the ash-pit and bridge-wall, as shown, a passage or passages between the bridge-wall and an auxiliary wall, such passage or passages leading from the ash-pit to the fire-box, for the purpose stated, and two sets of air-passages, one set starting from the outer sides of the fire-box, extending along the sides to the rear, and joining at the center in one common passage, which discharges the heated air in the rear of the fire-box, the other set of passages starting from the outer sides of the fire-box, extending along the sides to the rear, and returning along the same sides and discharging their heated air in the front of the fire-box, substantially as and for the purpose stated.



414,038. APPARATUS FOR THE MANUFACTURE OF GAS. Chas. Graniss, Pittsburg, Pa., assignor to Charles M. Gearing, same place. Filed Dec. 20, 1888. Serial No. 294,312. (No model.)

Claim.—1. The combination, in a gas apparatus, of a structure A, provided with a horizontal partition B, a combustion-chamber located below this partition, valved pipes and an injector for supplying this combustion-chamber with gas-producing materials, a superheating-chamber separated from the said combustion-chamber by a perforated wall C, a superheating-coil in this superheating-chamber and connected to the injector of the said combustion-chamber, tortuous generating-chambers located above and communicating with the said superheating-chamber, a pipe F, for supplying hydrocarbon to one of the said generating-chambers, an oil-supply tank connected to this pipe, an injector also connected to this pipe, and an exhaust apparatus connected to one of the generating-chambers for withdrawing the resultant gases, substantially as and for the purpose herein set forth.



2. In a gas apparatus, the combination of a combustion-chamber, valved pipes and an injector for supplying gas-producing materials to the said combustion-chamber, tortuous gas-generating chambers located above and communicating with each other and the combustion-chamber below, means for exhausting the gases from the upper one of these chambers, a hydrocarbon-supply pipe leading into the lower gas-generating chamber, and an injector for forcing the hydrocarbon into the said chamber, as and for the purposes herein set forth.

414,039. HEATING APPARATUS. Henry Seymour, Philadelphia, Pa., assignor to James H. and Frank Ferguson, both of Bridgeton, N. J. Filed Feb. 21, 1889. Serial No. 300,955. (No model.)

Claim.—In a vapor-heating device, the combination, with the hollow ring 21, an open-ended pipe 20, communicating with the ring, a casing provided with an opening, and a valve arranged opposite the open end of the pipe 20 to inject therein a stream of vapor, a retort for generating the vapor, of a vapor-conduit between the retort and the casing, and the burners communicating with the ring 21, substantially as set forth.

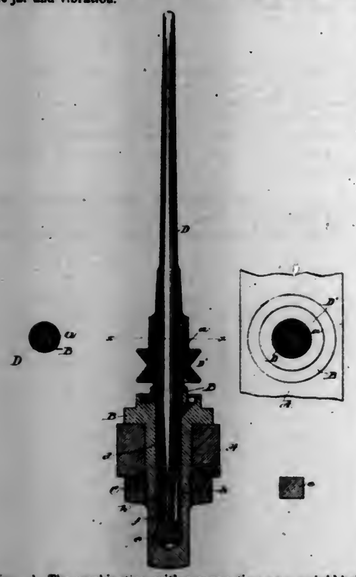
414,040. APPARATUS FOR ASSEMBLING HEEL-LIFTS. Chas. W. Gildden, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed July 15, 1889. Serial No. 317,585. (No model.)

Claim.—1. In an apparatus for assembling heel-lifts in the production of heels, a support for the lifts, and slides forming a stop for the breast end of the lifts, combined with a series of edge-stops located at different distances apart upon said slides and projecting at right angles therefrom to receive between them and correctly position the said lifts on both sides as they are being laid in a pile, substantially as described.

2. The support and slides having edge-stops arranged in a projecting series upon each slide to form opposite parallel pairs, combined with means to adjust the said slides simultaneously toward and from each other, substantially as described.

3. The support for the lifts and slides having edge-stops arranged in a projecting series upon each slide to form opposite parallel pairs, as shown, combined with means to hold the said slides in adjusted position, substantially as described.

4. A support for lifts, combined with edge-stops arranged in pairs for the different lifts of the heel, the said stops being open, as described, to permit the introduction of the said lifts horizontally into position between the said stops, substantially as described.

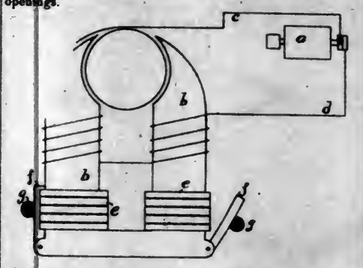


414,041. HEAD-PROTECTOR. PHILIPP GOLDMANN, New York, N. Y. Filed Aug. 22, 1889. Serial No. 321,571. (No model.)

Claim.—A head protector or muff consisting of the imperforate body-strip for covering the back and sides of the head, the segmental contracting strip secured continuously along one edge to the top edge of the body-strip, contracted inwardly to overlie and hug the rear of the crown of the head and tapering from the middle of its length to each end, and a fastening for holding the protector or muff in position, substantially as described and shown.

414,042. SUPPORT FOR SPINNING-SPINDLES. BENJAMIN N. GOODALE, Saco, Me., assignor to the Sawyer Spindle Company, Boston, Mass. Filed May 24, 1889. Serial No. 311,966. (No model.)

Brief.—The object of the invention is to produce a simple and cheap support which will permit the spindle to run at high speed and with little jar and vibration.

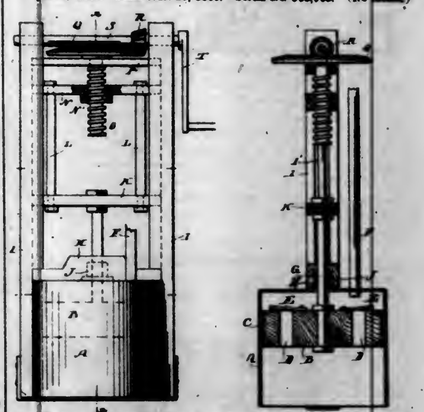


Claim.—1. The combination, with a supporting-case, a rigid bolster or lateral bearing therein in the line of the band-pull, and a step for the lower end of the spindle, of a sleeve-whirl spindle having a pintle of less diameter, as described, externally than the internal diameter of the said bolster-bearing, whereby the foot of the spindle is free to wander in the supporting-case on the said step, substantially as described.

2. The combination, with a supporting-case, a bolster-bearing therein in the line of the band-pull, and a step having a concaved or countersunk top, of a sleeve-whirl spindle having a pintle of less diameter, as described, externally than the internal diameter of the said bolster-bearing, the foot of the spindle being free to wander in the supporting-case, substantially as described.

414,043. ELECTRIC REGULATOR. LEONHARD GUTHARD, Fort Wayne, Ind. Filed Dec. 5, 1888. Serial No. 292,608. (No model.)

Claim.—1. In an electric-motor regulator, the combination of one set of coils connected in circuit with an alternating-current generator and mounted upon the arms of the field-magnet of the motor, and a set of rings of conducting material mounted on the same field-magnet core and provided with openings or slots, and a circuit-closer for said openings, the said closers being adapted to open and close the openings.

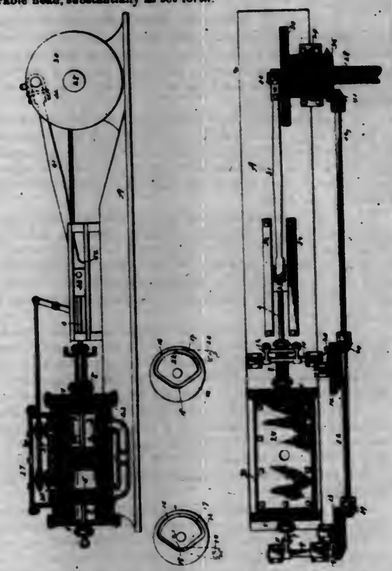


3. In an electric-motor regulator, the combination of conducting-rings mounted upon and surrounding the arms of the field-magnet of the said motor, and provided with openings to form incomplete rings, and a movable conducting-rod fitting into said openings.

3. In an electric-motor regulator, the combination of field-magnets provided with coils and independent concentric open rings insulated from one another mounted on the said field-magnets and provided with terminals, as and for the purpose described.

4. In combination with the field-magnets of an electric motor, open conductors surrounding in part the arms of the field-magnets and movable conductors connecting the open parts of the said open conductors.

5. In a regulator, the combination, with an iron core of a motor, choking-magnet, converter, or other induction apparatus, of a conductor in form of coils mounted upon the said iron core and in circuit with a suitable generator of alternating, pulsating, or intermittent currents, open conductors surrounding the said iron core, and means for closing said open conductors.

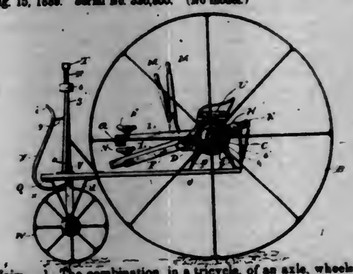


414,044. FORCE-PUMP. ROBBIN A. HEATH and JAMES HAY, Hopewell, Nebr. Filed Mar. 30, 1889. Serial No. 305,963. (No model.)

Claim.—The combination, in a force-pump, of a barrel closed at its top, vertical guide-posts I, horizontal hand-operated shaft bearing therein, a fixed horizontal beam P below said shaft, and having a short depending screw-shaft bearing therein and geared to the said horizontal shaft, horizontal cross-bars having their ends engaging said posts and connected together to form a movable frame, the upper bar having a threaded opening for the engagement of the depending screw-shaft, together with valved piston in barrel, fixed beam J, and piston-rod playing through beam J and connected to lower bar of movable frame, substantially as set forth.

414,045. STEAM-ENGINE. EDWARD HUBER, Marion, Ohio. Filed Apr. 25, 1889. Serial No. 308,542. (No model.)

Claim.—1. The combination, with a cylinder having inlet and exhaust ports, of a piston, movable heads located within the cylinder for closing the exhaust-ports, a main shaft actuated by the piston, a rotary shaft located alongside of the cylinder and extending in the direction of the length thereof, gearing connecting the rotary shaft and main shaft, and gearing on the rotary shaft for actuating the movable head, substantially as set forth.

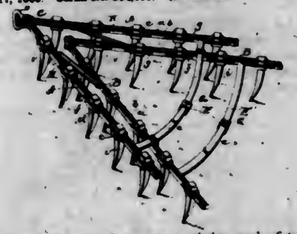


2. The combination, with a steam-cylinder and movable heads therein, of rocking-shafts, bevel gear-wheels having cams for rocking the shafts, and gearing for operating the cams, substantially as set forth.

3. The combination, with a steam-cylinder and movable heads therein, of rocking shafts connected with the heads, said shafts having arms with anti-friction rollers thereon, bevel gear-wheels with cams on their backs in which said rollers travel, and means for turning said gear-wheels, substantially as set forth.

4. The combination, with a cylinder and movable heads, of stems connected with the heads, rocking shafts for driving the stems, arms on the shafts with rollers thereon, bevel gear-wheels having cams, substantially as described, on their backs, with which the rollers engage, a main shaft having a bevel gear-wheel, and a shaft having bevel gear-wheels meshed with the other gear-wheels for communicating motion, substantially as set forth.

414,046. TRICYCLE. ROBERT T. HUGGINS, Florence, S. C. Filed Aug. 15, 1889. Serial No. 320,855. (No model.)



Claim.—1. The combination, in a tricycle, of an axle, wheels revolving on said axle, ratchet-wheels fixed to the hubs of said wheels, means, substantially as described, for revolving said ratchet-wheels, a front wheel, a bifurcated steering-rod, to which said wheel is journaled, a fifth-wheel fixed on said steering-rod, a platform, and hangers connecting said steering-rod and said axle, substantially as described.

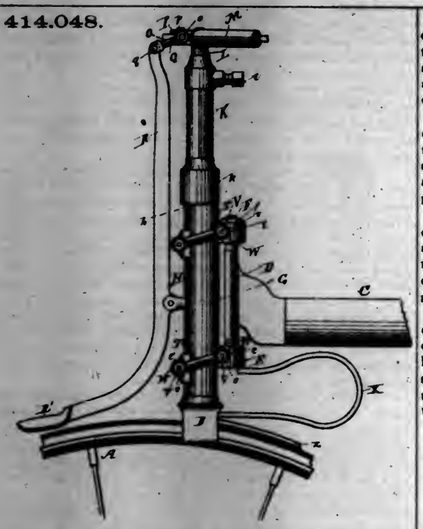
2. The combination, in a tricycle, of an axle, wheels on said axle, ratchet-wheels fixed to the hubs of said wheels, forward levers and rear levers fulcrumed on said axle, pawls pivoted to said levers and adapted to engage the teeth of the ratchet-wheel, substantially as shown, a cross-bar connecting said forward levers, a cross-bar connecting the rear levers, operating-levers fulcrumed on said axle, one operating-lever being fixed to said rear cross-bar and one lever fixed to said forward cross-bar, means, substantially as described, for working said operating-levers, a front wheel, a bifurcated steering-rod, in which said wheel is journaled, the fifth-wheel, and a platform resting on said fifth-wheel and attached to said axle, constructed and combined substantially as described.

3. The combination, in a tricycle, of an axle, wheels adapted to turn on said axle, ratchet-wheels fixed to the hubs of said wheels, levers fulcrumed on said axle, forward pawls pivoted on the forward levers, a coiled spring adapted to keep said pawls in contact with said ratchet-wheels, rear pawls pivoted on the rear levers, a semicircular spring adapted to keep said rear pawls in contact with said ratchet-wheels, cross-bars connecting the forward and rear levers, respectively, operating-levers adapted to form with said levers compound levers and to depress said cross-bars alternately, said operating-levers having pivoted foot-pedals and lever-handles, springs adapted to bring the operating-levers back to their normal position, a front wheel, a bifurcated steering-rod, a fifth-wheel on said rod, and a platform having a seat and connecting said axle and said fifth-wheel, all constructed and combined to co-operate substantially as shown.

4. The combination, in a tricycle, of an axle, wheels on said axle, means, substantially as described, for turning said wheels and propelling the machine, a front wheel, a bifurcated steering-rod, a platform connecting said axle and said rod and having a vertical frame supporting said rod, a handle and cross-rod adapted to guide the machine with the hands or feet, respectively, a spring encircling said vertical steering-rod, a brake pivoted to said bifurcated rod, and a spring connecting said brake and vertical steering-rod, all constructed and combined to operate substantially in the manner and for the purpose shown.

414,047. HARROW. WILLIAM P. HUGHES, Black Lick, Va. Filed June 17, 1889. Serial No. 314,655. (No model.)

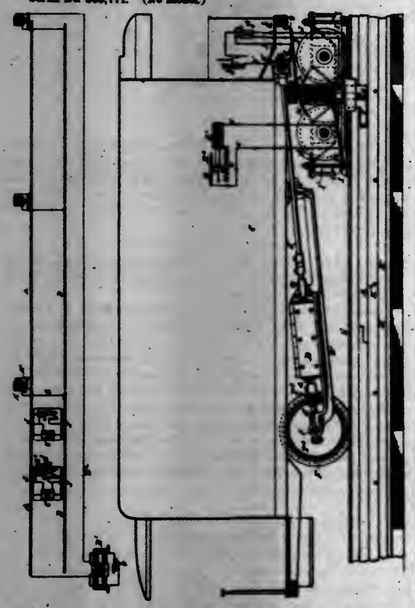
Claim.—In a harrow, the beams consisting each of two slotted and parallel bars bent or shaped to form angular tooth-recesses and adapted to slide upon one another longitudinally, in combination with the bolts for connecting and locking the bars together in their properly-adjusted position to bind the teeth, substantially as and for the purpose set forth.



414,048. VELOCIPEDE. DAVID R. HUNTER, Salem, Mass., assignor to the Pope Manufacturing Company, Portland, Me. Filed May 3, 1888. Serial No. 272,633. (No model.)

Claim.—1. The combination, in a velocipede-frame, of a spindle and reach and a pillar with bearing-seats for the spindle, another pillar connected with the first by one or more links on each side, having hinge-bearings to permit longitudinal movement of the pillars, and a spring, as X, constructed and operating to resist the relative longitudinal movement of the pillars, one of said pillars being constructed as an outer slotted tube and the other as an inner slide entering and operating substantially within the slotted tube.

2. The combination of fork B and a rigidly-connected pillar H, a brake-spoon lever R, fulcrumed on the fork-pillar, and a brake-handle lever O, fulcrumed on a handle-bar mounted on supporting



414,048.

devices, substantially as set forth, having a longitudinal motion with respect to the brake-spoon lever, and a swing-link Q between the brake-handle lever and the brake-spoon lever.

414,049. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa., assignor, by mesne assignments, to the Thomson-Houston Electric Company, Boston, Mass. Original application filed Nov. 30, 1886, Serial No. 220,940. Divided and this application filed Apr. 2, 1889. Serial No. 305,771. (No model.)

Claim.—1. In an electric railway, two working-conductors, a source of electrical energy, two or more electrically-propelled vehicles in multiple-arc connection and receiving current from said conductors, and shunt-circuits upon said vehicles to shunt a portion of the current around the motors.

2. In an electric railway, two working-conductors, a source of electrical energy, two or more electrically-propelled vehicles in multiple-arc connection and receiving current from said conductors, shunt-circuits upon said vehicles to shunt a portion of the current around the motors, and means to increase or decrease the resistance of said shunts.

3. In an electric railway, two working-conductors, a source of electrical energy, two or more electrically-propelled vehicles in multiple-arc connection and receiving current from said conductors, shunt-circuits upon said vehicles to shunt a portion of the current around the motors, and automatic means to increase or decrease the resistance of said shunts.

4. In an electrically-propelled vehicle, the combination of a source of electric supply, an electric motor, a shunt-circuit around the motor, a resistance-changer in said shunt-circuit, and an electrically-actuated regulator to control the resistance-changer to reduce the resistance of the shunt if the current in the motor-circuit increases above the normal, or vice versa.

5. In an electric railway, two or more sections of working-conductors, one or more electrically-propelled vehicles on each section, connections for coupling up said conductors, so as to put all the vehicles on the different sections in series connection and those upon the same section in multiple-arc connection, shunt-circuits around the motors on each of the vehicles, and a resistance-changer in each of the shunt-circuits.

6. In an electric railway, two working-conductors, a source of electricity of constant potential, two or more electrically-propelled vehicles receiving electricity from said conductors and coupled in multiple-arc connection with each other, a shunt-circuit around the motor on each of said vehicles, and a resistance-changer in said shunt-circuits.

7. In an electric railway, two working-conductors, a source of electricity of constant potential, two or more electrically-propelled vehicles receiving electricity from said conductors and coupled in multiple-arc connection with each other, a shunt-circuit around the motor on each of said vehicles, and an electrically-actuated resistance-changer in said shunt-circuit.

8. In an electric railway, two working-conductors, a source of electrical energy, two or more electrically-propelled vehicles in multiple-arc connection and receiving currents from said conductors, shunt-circuits upon said vehicles to shunt a portion of the current around the motors, means to increase or decrease the resistance of said shunts, and a resistance-changer on the vehicles to control the current flowing through the motors at the will of the operator.

9. In an electric railway, two working-conductors, a source of electricity of constant potential, two or more electrically-propelled vehicles receiving electricity from said conductors and coupled in multiple-arc connection with each other, a shunt-circuit around the motor on each of said vehicles, an electrically-actuated resistance-changer in said shunt-circuits, and a resistance-changer on the vehicles to control the current flowing through the motors at the will of the operator.

10. The combination of sectional conductors extending along an electric railway, two opposite conductors in succeeding sections being connected as described, electric locomotives in circuit between opposite sections and in series with one another, an electric switch at the end of each section for breaking connection between two successive sections, and shunting-circuits carried by the locomotives to shunt more or less of the current around the motors to prevent an excessive current passing through the motors.

11. The combination of two sectional conductors extending along an electric railway, two opposite conductors in succeeding sections being connected as described, electric locomotives in series making connection therewith, and an electric switch at the end of each section for controlling the connection between successive sections of one conductor, and shunting-circuits carried by the locomotives to shunt more or less of the current around the motors to prevent an excessive current passing through the motors.

12. The combination of a vehicle, a propelling electric motor therefor in series with other motors on the same road, bared conductors adapted for conveying the main current extending along the said road, a constant connection between said conductors and the motors, electrically-operated switches for shunting the main current through said motors, and shunting-circuits carried by the locomotives to shunt more or less of the current around the motors to prevent an excessive current passing through the motors.

13. The combination of a vehicle, a propelling electric motor therefor in series with other motors on the same road, bared conductors adapted for conveying the main current extending along said road, switches operated electrically for shunting the main current through said motor, means for preserving the continuity of the main line during the operation of said switches, and shunting-circuits carried by the locomotives to shunt more or less of the current around the motors to prevent an excessive current passing through the motors.

14. The combination of a vehicle, a propelling-motor in series with other motors on the same road, bared conductors extending along said road and adapted for carrying the main current, electric switches operated from a distance for directing the course of the main current over said conductors, electrical devices for operating said switches controlled by the current which passes over said conductors between said motor and the adjacent switch, and shunting-circuits carried by the locomotives to shunt more or less of the current around the motors to prevent an excessive current passing through the motors.

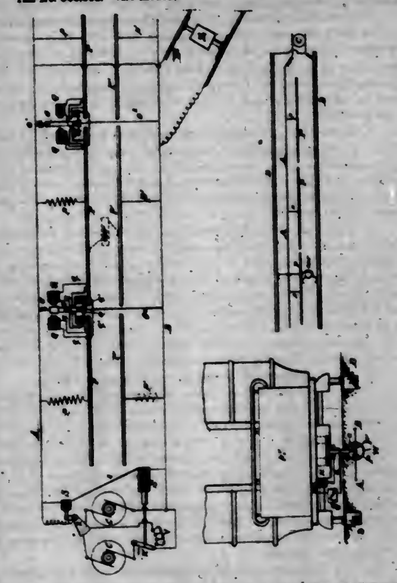
15. The combination of two conductors parallel with the line of an electric railway, electric locomotives in electrical connection with said conductors, said conductors being divided into insulated sections, each section of one conductor being connected with the opposite succeeding section of the other conductor, cross-connections containing electrical devices which control a connection between successive sections of the other conductor, and shunting-circuits carried by the locomotives to shunt more or less of the current around the motors to prevent an excessive current passing through the motors.

16. The combination of two or more electric motors in series, a vehicle supporting each motor and propelled thereby, a sectional electric conducting-path extending along the line of progress of said vehicles, conductors extending from each motor and making continuous connection with said conducting-path, the main current normally passing through the motors in succession, an automatic circuit-closer for each motor acting to preserve the continuity of the main line in the case of rupture of any motor-circuit, and shunting-circuits carried by the locomotives to shunt more or less of the current around the motors to prevent an excessive current passing through the motors.

17. The combination in an electric railway, of two conductors extending along the line of the road and divided into sections longer than the ordinary locomotives or trains on the road, electric locomotives having their motor-terminals constantly in connection with the two conductors, respectively, switches operated by the progress of the train or locomotive for sending the main current through the motors in succession, and shunting-circuits carried by the locomotives to shunt more or less of the current around the motors to prevent an excessive current passing through the motors.

18. The combination, with the two main conductors of an electric railway, of an electric locomotive having its terminals in connection with said conductors, respectively, a connection between said conductors, a circuit-breaker in said connection controlled by the progress of said locomotive, and shunting-circuits carried by the locomotives to shunt more or less of the current around the motors to prevent an excessive current passing through the motors.

19. The combination of two sectional conductors extending along an electric railway, each section of one conductor being electrically connected with the preceding section of the other conductor, locomotives in series in traveling connection with said conductors, circuit-controllers between the successive sections of one of the conductors, and shunting-circuits carried by the locomotives to shunt more or less of the current around the motors to prevent an excessive current passing through the motors.



20. The combination of sectional conductors extending along an electric railway, two opposite conductors in succeeding sections being connected as described, electric locomotives in circuit between corresponding sections of opposite conductors and in series with one another, an electric switch at the end of each section for breaking connection between two successive sections, and a shunt-circuit around the electric switch-magnet to reduce the current passing through the switch-magnet.

21. The combination of two sectional conductors extending along an electric railway, two opposite conductors in succeeding sections being connected as described, electric locomotives in series making connection therewith, an electric switch at the end of each section for controlling the connection between successive sections of one conductor, and a shunt-circuit around the electric-switch magnet to reduce the current passing through the switch-magnet.

22. The combination of a vehicle, a propelling electric motor therefor in series with other motors on the same road, bared conductors adapted for conveying the main current extending along the said road, a constant connection between said conductors and the motor, electrically-operated switches for shunting the main current through said motors, and a shunt-circuit around the electric-switch magnet to reduce the current passing through the switch-magnet.

23. In an electric railway, two conductors to supply current to the motors on the cars, a constant-potential and varying-current dynamo or generating-machine for supplying current to the conductors, two or more electrically-propelled vehicles receiving current from said conductors, and variable resistances or regulating devices on the car to vary the current passing through the motor.

414,050. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa., assignor, by mesne assignments, to the Thomson-Houston Electric Company, Boston, Mass. Original application filed Mar. 18, 1886, Serial No. 195,762. Divided and another application filed Feb. 20, 1888, Serial No. 300,585. Again divided and this application filed Apr. 6, 1889. Serial No. 306,302. (No model.)

Claim.—1. In an electric railway, the combination of the main or traffic rails, a slotted conduit, one or more longitudinal working-conductors arranged along the railway within the conduit and divided into sections, one or more continuous main or supply conductors normally connected with each of said sections of working-conductors, a source of electric supply connecting with the main conductor, and a motor mounted upon a car traveling upon said traffic-rails and provided with suitable current-collecting devices extending into the conduit and bearing upon said longitudinal working conductor or conductors.

2. In an electric railway, the combination of the main or traffic rails, a slotted conduit, a longitudinal working-conductor arranged parallel to but independent of the traffic-rails and located within the conduit, a supply or main conductor also extending longitudinally along the railway, electrical connections between the main and working conductors and independent of the traffic-rails, and an electric motor mounted on a car traveling upon the traffic-rails and provided with suitable current-collecting devices extending into the conduit and bearing against the longitudinal working-conductor.

3. In an electric railway, the combination of the main or traffic rails, a longitudinal sectional working-conductor arranged parallel to but independent of the traffic-rails, a supply or main conductor also extending longitudinally along the railway, electrical connections between the main conductor and each section of working-conductor and independent of the traffic-rails, switches for connecting either of two adjacent sections of working-conductor with the supply-conductor, and an electric motor mounted on a car traveling upon the traffic-rails and provided with suitable current-collecting devices bearing against the longitudinal working-conductor sections.

4. In an electric railway, the combination of electric conductors extending along the line of the railway, traveling electrically-propelled vehicles receiving current from said conductors, two or more stationary electric generators for supplying electric current to the electric conductors, and switches and circuits for coupling said generators in series or multiple with respect to each other, and at all times maintain them in series with the electric conductors extending along the railway and electrically-propelled vehicles receiving current therefrom.

5. In an electric railway, the line-conductors in combination with two or more stationary electric generators, and switches for coupling said generators up in multiple or in series with each other and with line-conductors, and resistances controlled by said switches and adapted to be thrown into circuit when said generators are coupled in series.

6. In an electric railway, the line-conductors in combination with two or more stationary electric generators, and switches for coupling said generators up in multiple or in series with each other and with

the line-conductors, and resistances controlled by said switches and adapted to be thrown into circuit when said generators are coupled in series, and means to vary the amount of said resistances, substantially as and for the purpose specified.

7. In an electric railway, the line-conductors in combination with two or more stationary electric generators, and electrically-actuated switches controlling the variations in the line-current for coupling said generators up in multiple or in series with each other and with the line-conductors upon the line-current becoming unsuited to the variations in resistance put upon the line, substantially as and for the purpose specified.

8. In an electric railway, the line-conductors in combination with two or more electric generators, switches for coupling said generators up in multiple or series, resistances thrown in or out of circuit by said switches, and electrical devices to actuate said switches controlled by the varying resistances on the line, substantially as and for the purpose specified.

9. In an electric-railway system, the combination of continuous main conductors and working-conductors normally connected with said main conductors, from which working-conductors the current is taken by the motors, a pair of electro-magnets respectively in electrical circuit with the working-conductors of two adjacent sections, and the return or opposite main conductor, and an armature adapted to be actuated by said magnets to close a second electric connection with the main conductor and its adjacent section to supply an increased current to the working-conductors when in circuit with a passing motor, substantially as and for the purpose specified.

10. In an electric-railway system, the combination of continuous main conductors and working-conductors, normally connected with said main conductors, from which working-conductors the current is taken by the motors, a pair of electro-magnets respectively in electrical circuit with the working-conductors of two adjacent sections, and the return or opposite main conductor, and an armature adapted to be actuated by said magnets to break the circuit of one magnet and also close a second electric connection with the main conductor and its adjacent section to supply an increased current to the working-conductors when in circuit with a passing motor, substantially as and for the purpose specified.

11. The combination of the line-conductors A B, working-conductors P P', electro-magnets Q Q, armature O for closing an auxiliary circuit from conductor A to working-conductor P, branch circuits *q*, containing said electro-magnets Q Q, wire O', and circuit-breakers *q' o*, to control the circuits *q O'*, substantially as and for the purpose specified.

12. In an electric railway, the line or main conductors in combination with a sectional conductor, a branch connecting one main conductor with one section of the working-conductor, a second branch connecting the section with the other main conductor and containing an electro-magnet, and an auxiliary circuit-closer actuated by said electro-magnet to supply a stronger current to the section when the motor is upon it, substantially as and for the purpose specified.

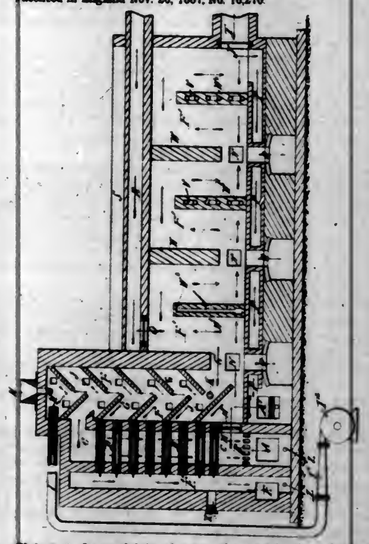
13. In an electric railway, the combination of an electrically-propelled vehicle, a sectional working-conductor, a continuous line-conductor, interposed resistances between the line and working conductor sections, and automatic devices controlled by a vehicle making contact with a section of working-conductor to reduce the resistance between the line and working conductor sections.

14. In an electric railway, the combination of an electrically-propelled vehicle, a sectional working-conductor, a continuous line-conductor, interposed resistances between the line and working conductor sections, said resistances increasing as they are nearer to the generator to make the current passing over them equal, and automatic devices controlled by a vehicle making contact with a section of working-conductor to reduce the resistance between the line and working conductor section.

15. In an electric railway, a main conductor and a sectional working-conductor, in combination with permanent electrical connections between main-conductor and working-conductor sections, additional circuits between the main-conductor and working-conductor sections, and switches in said additional circuits.

16. In an electrical railway, a main conductor connecting with a source of electric supply, and a sectional working-conductor, in combination with permanent electrical connections between the main-conductor and working-conductor sections, having increasing resistances as they approach the source of electric supply, additional circuits between the main-conductor and working-conductor sections, and switches in said additional circuits.

17. In an electric railway, a main conductor and a sectional working-conductor, in combination with permanent electrical connections between the main-conductor and working-conductor sections, additional circuits between the main-conductor and working-conductor sections, and electro-magnetic switches in said additional circuits.



18. The combination of two main conductors with two lines of sectional working-conductors, electrical connections between said main-line conductors, respectively, with one of said lines of sectional working-conductors, a circuit-controlling switch in said connecting-circuits with one of said line of working-conductors, an electro-magnet to operate said switch, and a circuit connecting said main conductors and including the electro-magnet.

19. The combination of a main or supply conductor, a sectional working-conductor therefor, a return-circuit, a source of electric supply connecting with the main conductor and return-circuit, an electrically-propelled vehicle receiving current from the working-conductor and return-circuit, connecting-circuits between the main conductor and sections of working-conductor, and electro-magnetic switches in parallel connection with the motors on the electrically-propelled vehicles for controlling the current to the sectional working-conductor.

20. The combination of positive and negative conductor arranged along a railway, electrically-actuated cars therefor receiving current from said conductors, a supply-conductor, and electro-magnetic devices in parallel with the motor on the car and controlled by the passage of the car to connect the positive conductor with the supply-conductor to increase the current passing to the car.

21. In an electric railway, the combination of electric conductors extending along the line of the railway, traveling electrically-propelled vehicles receiving current from said conductors, two or more stationary electric generators for supplying electric current to the electric conductors, switches and circuits for coupling said generators in series or multiple with respect to each other and at all times maintain them in series with the electric conductors extending along the railway, and the electrically-propelled vehicles receiving current therefrom, and resistances located close to the generators and adapted to be thrown into and out of circuit to compensate for variation in the current passing to the conductors of the railway.

414,051. FURNACE FOR CALCINING ORES. HENRY HUTCHINSON, London, England. Filed Mar. 16, 1889. Serial No. 303,535. (No model.) Patented in England Nov. 26, 1887, No. 16,270.

Claim.—1. In a calcining-furnace, the combination of a vertical calcining-chamber, a vertical heating-chamber communicating at its upper end with the upper part of said calcining-chamber, gas and air inlet ports arranged at the lower end of said heating-chamber, and air-conduits located in said air-heating chamber and arranged to deliver heated air to said calcining-chamber, substantially as herein described.

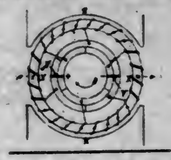
2. In a calcining-furnace, the combination of a vertical calcining-chamber, a vertical heating-chamber communicating at its upper end with the upper part of said calcining-chamber, gas and air inlet ports arranged at the lower end of said heating-chamber, a vertical air-chamber, and a series of air-conduits arranged to traverse said heating-chamber, so as to be heated by the combustion of gaseous fuel therein, and each in communication at one end with said air-chamber and at the other end with the interior of said calcining-chamber, substantially as herein described, for the purposes set forth.

3. In a calcining-furnace, the combination of a vertical calcining-chamber provided with a series of inclined surfaces or shelves, a vertical heating-chamber communicating at its upper end only with said calcining-chamber, gas and air inlet ports located at the lower part of said heating-chamber, a series of air-conduits traversing said heating-chamber and each in communication at one end with said calcining-chamber and at the other with an air-supply, and an inlet for ore or other substance, located at the upper part of said calcining-chamber, substantially as herein described, for the purposes set forth.

4. In a calcining-furnace, the combination of a vertical calcining-chamber provided with a series of inclined surfaces or shelves, a vertical heating-chamber connected at its upper part with the upper part of said calcining chamber, gas and air inlet ports located at the lower part of said heating-chamber, a series of air-conduits traversing said heating-chamber and in communication with said calcining-chamber, and a settling-chamber in communication with the lower end of said calcining-chamber, substantially as herein described, for the purposes set forth.

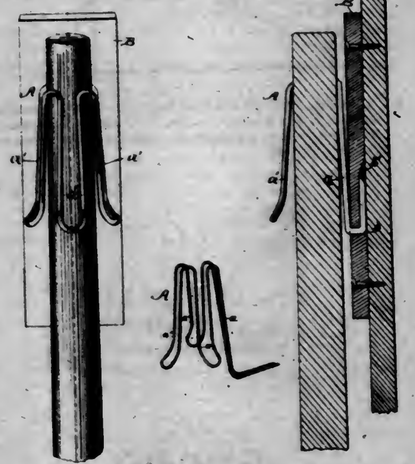
5. In a calcining-furnace, the combination of a vertical calcining-chamber, an air-heating chamber in communication with the upper end of said calcining-chamber, a settling-chamber in communication with the lower end of said calcining-chamber, a flue located above and arranged to be placed in communication with said settling-chamber, a valve or door for controlling the communication between said flue and settling-chamber, and a drying-floor located above said flue, substantially as hereinabove described, for the purposes set forth.

6. In a calcining-furnace, the combination of a calcining-chamber, an air-heating chamber in communication with the upper end thereof, a settling-chamber in communication with the lower end of said calcining-chamber, a flue located below the floor of said settling-chamber, and a combustion-chamber in communication with said flue, for the purpose set forth.



7. In a calcining-furnace, the combination of a vertical calcining-chamber having an inlet at its upper part for material to be treated, a heating-chamber in communication with the upper end of said calcining-chamber, gas and air inlet ports at the lower end of said heating-chamber, air-conduits traversing said heating-chamber and arranged to deliver heated air into said calcining-chamber, a settling-chamber in communication with the lower part of said calcining-chamber, a passage connecting the lower part of said calcining-chamber with said heating-chamber, and a valve or damper for controlling said passage, substantially as herein described, for the purpose set forth.

8. In a calcining-furnace, the combination of a vertical calcining-chamber provided with a series of inclined surfaces or shelves and with an inlet at its upper part for material to be treated, a vertical heating-chamber communicating at its upper end with said calcining-chamber, inlet-ports arranged to deliver air and combustible gas into the lower part of said heating-chamber, a series of air-conduits traversing said heating-chamber and communicating with said calcining-chamber, and a pipe or passage arranged at the lower part of said calcining-chamber for the introduction of common salt to the lower part of said calcining-chamber.



9. In a calcining-furnace, the combination of a vertical calcining-chamber provided with a series of inclined surfaces or shelves and with an inlet at its upper part for material to be treated, a vertical heating-chamber in free communication at its upper end with the upper end of said calcining-chamber, a passage located between the lower ends of said calcining and heating chambers, a valve that normally closes said passage, a series of horizontal air-conduits traversing said heating-chamber and each in communication at one end with an air-chamber and at the other end with the calcining-chamber, ports for admission of air and combustible gas to the lower end of said heating-chamber, a settling-chamber in communication with the lower end of said calcining-chamber, and provided with walls or divisions extending alternately from the floor and roof of said settling-chamber, a flue located above said settling-chamber and arranged to be placed in communication therewith, a valve for controlling said communication, a drying-floor located above said flue, a lower flue located below said settling-chamber, and a combustion-chamber in communication with said lower flue, all substantially as herein described, for the purposes specified.

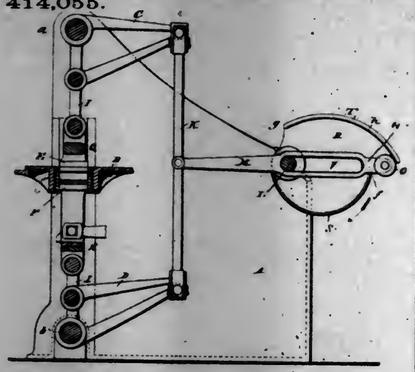
414,052. METHOD OF REGULATING ELECTRIC MOTORS. MORITZ IMMISCH, London, County of Middlesex, England. Filed Feb. 2, 1888. Serial No. 262,718. (No model.) Patented in England Mar. 2, 1886, No. 2,956; in France Mar. 24, 1886, No. 174,996; in Belgium Mar. 26, 1886, No. 72,496; in Canada Feb. 17, 1887, No. 26,080; in Victoria Feb. 18, 1887, No. 4,867; in New Zealand May 26, 1887, No. 2,354, and in India June 14, 1887, No. 37.

Claim.—The method herein described of operating electric motors with constant load, which consists in short-circuiting opposite armature-coils successively and maintaining a continuous operative electrical connection between the terminals thereof during the entire time said coils are passing at the neutral zone through an arc equal to the length of one coil-section of the armature, whereby as the positions of the polar points of the field-magnets change with varying load and speed the short-circuited coils will themselves generate currents acting to correct distortion of the field of force, substantially as described.

414,053. HOLDER FOR BROOMS, &c. HORACE D. JOHN, Germany, Ohio, assignor of one-half to Peter Brubaker, same place. Filed July 31, 1889. Serial No. 319,337. (No model.)

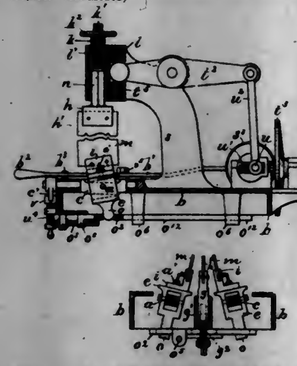
Claim.—A new article of manufacture consisting in a single length of flexible wire bent into the particular shape herein figured and described, so as to form an inverted socket A, having a straight back a and three clasps *a'*, said clasps being flared at their lower ends, the whole constructed and arranged for the purpose of receiving and securely holding any straight-handled implement, as hereinbefore set forth.

414,054. PENDANT-SET WATCH. ABOU B. KEHFORT, Reading, Pa., assignor of two-thirds to Gustavus A. Schlechter and James M. Burkhart, both of same place. Filed Feb. 23, 1889. Serial No. 301,465. (No model.)



Claim.—A stem winding and setting watch having an axially-moving pendant-knob, substantially as described, and a pendant-bow with chain-eye F, and a bar G, arranged to engage said knob, substantially as and for the purpose set forth.

414,055. BRICK-MACHINE. LEWIS B. KENNEDY, St. Louis, Mo., assignor to the Kennedy Dry Press Brick Machine Manufacturing Company, Pueblo, Colo. Filed Sept. 5, 1888. Serial No. 283,994. (No model.)



Claim.—1. In a brick-machine of the character described, the compression-plungers attached to the bell-crank levers by means of links, said levers being connected at their outer ends by toggle-levers operated from a continuously-rotated shaft, as set forth.

2. In a brick-machine, the angle or bell-crank levers C and D, pivoted in the sides of the machine, said levers being connected to the plungers by means of links which yield in opposite directions, the outer ends of the angle or bell-crank levers operated from a continuously-revolving shaft.

414,055.

414,056. CURVED-MOLDING MACHINE. ARBON O. KITTREDGE, Slate Hill, N. Y., and THOMAS S. CRANE, East Orange, N. J., assignors to the Vulcan Company, of Pennsylvania. Filed Feb. 6, 1889. Serial No. 299,796. (No model.)

Claim.—1. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of lateral bending-dies connected together and adapted to be moved simultaneously upon opposite sides of the crimping-dies, substantially as set forth.

2. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of lateral bending-dies provided with movable carriers, and a connection between said carriers for moving the lateral dies simultaneously, substantially as set forth.

3. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of lateral bending-dies provided with carriers supported each upon two pivots and thereby adapted to rock in two different directions, and a connection between said carriers for rocking them simultaneously, substantially as set forth.

4. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of lateral bending-dies provided with carriers supported each upon two pivots and thereby adapted to rock in two different directions, die-holders adjustable laterally upon the said carriers, and a connection between said carriers for rocking them simultaneously.

5. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of lateral bending-dies connected together and adapted to be moved simultaneously, and means, substantially as described, for adjusting the crimping-dies toward one another, as and for the purpose set forth.

6. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of lateral bending-dies connected together and adapted to be moved simultaneously, means for adjusting the crimping-dies toward one another to vary the pressure upon the sheet metal, and means for vertically adjusting the stationary crimping-die in relation to the lateral bending-dies to vary the curvature of the sheet metal, substantially as herein set forth.

7. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of lateral bending-dies connected together and adapted to be moved simultaneously, and means, substantially as described, for adjusting the crimping-dies toward one another while in operation.

8. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of lateral bending-dies connected together and adapted to be moved simultaneously, a vibrating carrier for the movable crimping-die, and a die-holder fitted adjustably upon said carrier and movable thereon while in operation.

9. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of lateral bending-dies connected together and adapted to be moved simultaneously, a sliding carrier for the movable crimping-die, a movable die-holder fitted to a socket therein, and a screw movable with the carrier and adapted to adjust the holder and die upon the carrier, as and for the purpose set forth.

10. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of lateral bending-dies connected together and adapted to be moved simultaneously, a bed supporting the fixed dies and carrying the driving mechanism, a goose-neck column sustaining a movable carrier for the movable crimping-die, means for reciprocating the carrier upon the goose-neck, and a die-holder adjustable upon the carrier, as and for the purpose set forth.

11. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of a frame sustaining the fixed die removably, a pivoted bar mounted at each side of the fixed die, and a rocking carrier pivoted upon each bar and thereby adapted to rock longitudinally and transversely to the bar, as and for the purpose set forth.

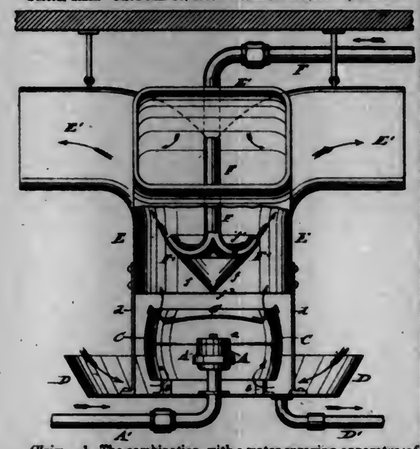
12. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of a frame sustaining the fixed die removably, a pivoted bar mounted at each side of the fixed die, a rocking carrier pivoted upon each bar, a connection between the carriers to rock them simultaneously, and die-holders adjustable upon the carriers, substantially as set forth.

13. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of a frame sustaining the fixed die removably, a pivoted bar mounted at each side of the fixed die, a rocking carrier pivoted upon each bar, a connection between the carriers to rock them simultaneously, and a connection between the bars to rotate them in opposite directions, as and for the purpose set forth.

14. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of a frame sustaining the fixed die removably, a pivoted bar mounted at each side of the fixed die, a rocking carrier pivoted upon each bar, tail-pieces upon the carriers, an adjustable guide slotted to receive the tail-pieces, and toothed segments fitted to the pivoted bars and connected to rotate them in opposite directions, as and for the purpose set forth.

15. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of a frame sustaining the fixed die removably, a pivoted bar mounted at each side of the fixed die, a rocking carrier pivoted upon each bar, tail-pieces upon the carriers, an adjustable guide slotted to receive the tail-pieces, toothed segments fitted to the pivoted bars and connected to rotate them in opposite directions, and means for moving one or both of the segments to rock the lateral dies in opposite directions, as and for the purpose set forth.

16. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of a frame sustaining the fixed die removably, a pivoted bar mounted at each side of the fixed die, a rocking carrier pivoted upon each bar, tail-pieces upon the carriers, an adjustable guide slotted to receive the tail-pieces, toothed segments fitted to the pivoted bars and connected to rotate them in opposite directions, and means for clamping one or both of the bars when adjusted, as and for the purpose set forth.



17. In a sheet-metal-molding machine, the combination, with fixed and movable crimping-dies, of pivoted carriers arranged at opposite sides of the fixed crimping-die, and holders for lateral dies fitted to seats upon said carriers and movable to and from the crimping-die and rotary upon the said seats to set them at an angle with the crimping-die.

18. In a sheet-metal-molding machine, the combination, with fixed and movable crimping-dies, of pivoted carriers arranged at opposite sides of the fixed crimping-die, lateral die-holders provided each with a fulcrum-pin upon its under side and a slot in its foot, a groove in each carrier transverse to the fixed crimping-die to receive the fulcrum-pin, and a bolt and nut fitted to the groove and slot and operated to clamp the holder upon the carrier, as and for the purpose set forth.

19. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of lateral bending-dies connected together and adapted to be moved simultaneously, a bed supporting the fixed dies, a rotary driving-disk supported upon said bed, mechanism for vibrating the movable crimping-die, a friction-wheel for driving said mechanism, and a hand-lever for moving said friction-wheel to and from the center of the driving-disk while in operation to vary the speed of the movable die, substantially as herein set forth.

20. In a sheet-metal-molding machine, the combination, with movable and fixed crimping-dies, of lateral bending-dies connected together and adapted to be moved simultaneously, a bed supporting the fixed dies, a rotary driving-disk supported upon said bed, adjustable mechanism for vibrating the movable crimping-die with a variable stroke, a friction-wheel for driving said mechanism, and a hand-lever for moving said friction-wheel to and from the center of the driving-disk while in operation to vary the speed of the movable die, substantially as herein set forth.

414,057. APPARATUS FOR MOISTENING AIR. EMILE KLAESS, Boston, Mass. Filed Jan. 16, 1889. Serial No. 296,569. (No model.)

Claim.—1. The combination, with a water-spraying apparatus, of an annular concavo-convex air-nozzle located above the spraying apparatus, an air-supply pipe connecting the center of the nozzle with a suitable air-forcing apparatus, and an inverted cone attached to the under side of the nozzle, substantially as set forth.

2. The combination, with a water-spraying apparatus, of an annular air-supply nozzle the mouth of which is located above the spraying apparatus, an air-supply pipe connecting said annular air-nozzle with a suitable air-forcing apparatus, and an air-flue encircling said nozzle and provided with discharge-nozzles, substantially as set forth.

3. The combination of a water-spraying apparatus formed of a spray-nozzle having radial jet-openings, a dispersion-vessel surrounding said nozzle, a drip-pan below said spray-nozzle, an annular air-supply nozzle the mouth of which is located above the water-spraying-device, an air-supply tube connecting said nozzle with a suitable air-forcing apparatus, and an air-flue surrounding said air-supply nozzle and provided with discharge-nozzles, substantially as set forth.

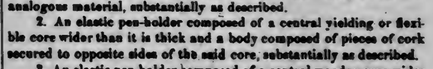
4. The combination, with a water-spraying apparatus, of an annular concavo-convex air-nozzle located above the spraying apparatus, an air-supply pipe connecting the center of the nozzle with a suitable air-forcing apparatus, a drip-collecting cone attached to the under side of the nozzle and provided with a discharge-opening in its apex, and a drip-pipe passing through the lowest part of the nozzle, substantially as set forth.

414,058. POCKET-LAMP. ELIAS B. KOOPMAN, New York, N. Y. Filed Apr. 24, 1889. Serial No. 308,356. (No model.)

Claim.—1. In a lighting device, a light-producing apparatus, combined with an automatically-revoluble carrier and a removable disk provided with drops or bits of explosive material and applied to said carrier, and a scratcher against which the explosive material is forced and by which it is ignited as the carrier is revolved, substantially as described.

2. In a lighting device, a light-producing apparatus, combined with a rotary carrier provided with teeth, a disk of ignitible pellets applied thereto, a spring-pawl to engage said teeth on the carrier and rotate it tooth by tooth to ignite successive pellets, and a scratcher, substantially as described.

3. In a lighting device, a light-producing apparatus, a case containing it, and a spring arranged in and fastened to said case and having one end formed as a pawl and provided with a button to move it, combined with a rotary fulminate-carrier arranged in said case and constructed with ratchet-teeth adapted to be engaged by said pawl, a disk of ignitible pellets applied to said carrier, and a scratcher, substantially as described.



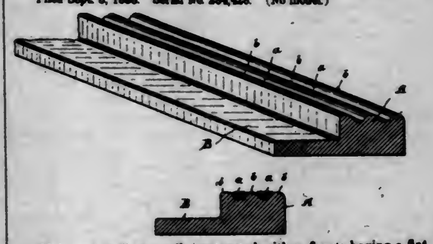
4. In a lighting device, a light-producing apparatus, a case containing it, and a spring arranged in and fastened to said case and having one end formed as a pawl and provided with a button to move it, combined with a rotary fulminate-carrier arranged in said case and constructed with ratchet-teeth adapted to be engaged by said pawl, a disk of ignitible pellets applied to said carrier, a projection from the spring to dog said carrier by engagement with its teeth, and a scratcher, substantially as described.

5. In a lighting device, the lamp proper, a case containing it, a cover hinged to said case, a rotary fulminate-carrier provided with ratchet-teeth, a disk of ignitible pellets applied to said carrier, and a scratcher, combined with a spring having one end formed as a pawl to engage the ratchet-teeth of the carrier to rotate it, and also constructed with a detent for the carrier, and also having its other end in engagement with the cover to throw it open as the pawl is actuated to rotate the carrier, substantially as described.

6. A lighting device composed of a case, a hinged side containing the lamp proper, and a scratcher thereon, a rotary toothed fulminate-carrier, a fulminate-disk applied to said carrier, a cover for the case, and a spring comprising a pawl and a detent for the carrier, and a cover-opener, substantially as described.

7. In a lighting device, a light-producing apparatus, combined with a carrier adapted to receive a removable disk of ignitible pellets and provided with a ratchet, a pawl to engage the said ratchet to move it and the carrier tooth by tooth, a detent for the ratchet, and a scratcher against which the ignitible pellets are forced and by which they are ignited as the carrier is revolved, substantially as described.

414,059. CORK-WOOD PEN-HOLDER. FREDERICK M. LIBBY, Portland, Me. Filed Oct. 29, 1888. Serial No. 289,404. (No model.)

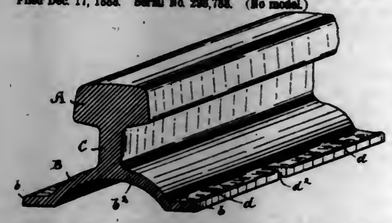


Claim.—1. An elastic pen-holder composed of a central yielding or flexible core made wider than it is thick and a body of cork or analogous material, substantially as described.

2. An elastic pen-holder composed of a central yielding or flexible core wider than it is thick and a body composed of pieces of cork secured to opposite sides of the said core, substantially as described.

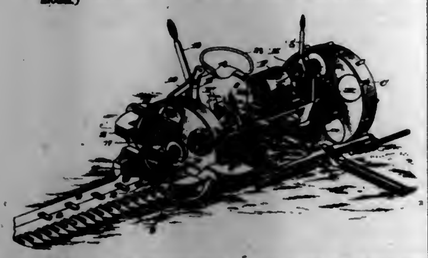
3. An elastic pen-holder composed of a central wooden core wider than it is thick and a body composed of pieces of cork secured to opposite sides of the said core, substantially as described.

414,060. STREET-RAILROAD. HOSEA W. LIBBEY, Boston, Mass. Filed Sept. 3, 1888. Serial No. 284,423. (No model.)



Claim.—A railway-rail constructed with a flange having a flat upper surface and a tread projecting therefrom, the upper surface of said tread having continuous longitudinal grooves and projections extending the whole length of the rail, substantially as and for the purposes set forth.

414,061. RAIL FOR STREET-RAILWAYS. HOSEA W. LIBBEY, Boston, Mass. Filed Sept. 3, 1888. Serial No. 284,629. (No model.)

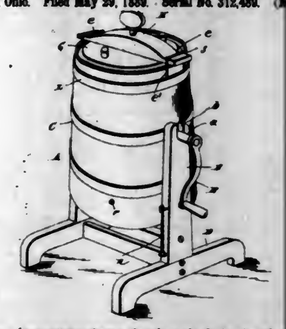


Claim.—A railway-rail constructed with a flange having a series of semi-spherical projections and a tread projecting therefrom, the upper surface of the tread being above the semi-spherical projections to allow the flange of the car to pass over them, substantially as shown and described.

414,062. RAILROAD-RAIL. HOSEA W. LIBBEY, Boston, Mass. Filed Dec. 17, 1888. Serial No. 293,788. (No model.)

Claim.—A railroad-rail consisting of a head and a lower flange arched in the center and flat at its outer edges, said flat edges being provided with oblong holes or slots, substantially as shown and described.

414,063. MOWING-MACHINE. PHILIP LORENZ and LEWIS P. LORENZ, Rimersburg, Pa. Filed May 16, 1889. Serial No. 310,951. (No model.)



Claim.—1. The combination of the axle having the tubular spindle, a bracket mounted longitudinally in the line of motion of the machine upon said axle, the adjusting-frame pivoted to the rear end of said bracket and having a shoe at its lower end, mechanism for adjusting the front end of said frame, the cutting apparatus hinged in said shoe, mechanism for raising said cutting apparatus and retaining it in an approximately horizontal position, and a pitman arranged in the tubular spindle and connected with the reciprocating cutter-bar, substantially as herein set forth.

2. In a mowing-machine, the combination of the axle having a tubular spindle at one end, the horizontal bracket mounted upon said axle, the adjusting-frame connected pivotally with the rear end of said bracket, means for adjusting the front end of said frame vertically, the cutting apparatus mounted pivotally in a shoe at the lower end of said adjusting-frame, mechanism for raising the said cutting apparatus to and retaining it in an approximately vertical position, a transversely-reciprocating pitman having a bearing in the tubular spindle of the axle, mechanism for transmitting motion to said pitman from the driving-wheel of the machine, and a link connecting the outer end of said pitman with the transversely-reciprocating cutter-bar, substantially as and for the purpose herein set forth.

3. In a mowing-machine, the combination, with the axle having a tubular spindle, of the longitudinal bracket mounted upon the said axle, the adjusting-frame connected pivotally to the rear end of said bracket and having at its front end an arm extending laterally through a segmental slot in the front end of the said bracket, a lever connected pivotally to the inner side of the said bracket and having a spring-latch engaging with a segmental rack formed upon the said bracket, a link connecting said lever pivotally with the arm extending from the adjusting-frame, a shoe formed at the lower end of the latter, the cutting apparatus mounted pivotally in the said shoe, and a link connecting the transversely-reciprocating cutter-bar with an arm extending downwardly from the outer end of a pitman arranged to reciprocate in the tubular spindle of the axle, and mechanism for transmitting motion to the said pitman from the driving-wheel of the machine, substantially as and for the purpose set forth.

4. In a mowing-machine, the combination of the axle having a tubular spindle at one end, a bracket mounted longitudinally upon the said axle, the adjusting-frame connected pivotally to the rear end of said bracket, mechanism for adjusting the front end of said frame vertically, the cutting apparatus mounted pivotally in a shoe in the lower end of said adjusting-frame, a link connecting the cutter-bar with a pitman arranged to reciprocate in the tubular spindle of the axle, means for transmitting motion to said pitman from the driving-wheel of the machine, a standard rising vertically from the axle, a bell-crank lever at the upper end of said standard, a link connecting one arm of said bell-crank with the finger-bar of the cutting apparatus, a hand-lever connected pivotally to the standard and adapted to engage a series of teeth or ratchets formed thereon, and a link connecting said hand-lever with the vertical arm of the said bell-crank, all constructed and operating substantially in the manner and for the purpose herein shown and specified.

414,064. CHURN. HARRY H. LOTH and CHRISTIAN ZIMMER, Wapakoneta, Ohio. Filed May 29, 1889. Serial No. 312,469. (No model.)

Claim.—In a rotary churn, the churn-body having the perforated hoop C, located about midway of the length of the churn-body, and the journals *a*, having heads *c* and projecting through the perforations in said hoop, the heads *c*, resting between the churn-body and the hoop, whereby they are securely bound to the churn when the hoop is driven to its seat, substantially as set forth.

414,065. FOLDING TABLE. HENRY A. LOFT, New York, N. Y. Filed Feb. 28, 1889. Serial No. 301,502. (No model.)

Claim.—1. The combination of the leg-frame having a top shelf, the table-top composed of jointed side sections and a central section hinged, adjacent to the middle of its length, to the top shelf and adapted to abut the leg-frame when turned to a vertical position, and adjustable brackets adapted to rest against the leg-frame to support the side sections in a horizontal position and movable to a position upon the upper side of the top shelf to bear directly against the central section and thereby brace the latter in a vertical position, substantially as described.

2. A table consisting of a leg-frame having a series of shelves arranged one above the other, a table-top composed of jointed side sections and a central section hinged, adjacent to the middle of its length, to the edge of the top shelf, and two side brackets hinged, respectively, to opposite edges of the top shelf and adapted to rest against the leg-frame to support the side sections in a horizontal position and to swing into a position upon the upper side of the top shelf and bear directly against the central section to brace the latter in a vertical position, substantially as described.

414,066. MACHINE FOR FILLING THE TICKS OF MATTRESSES. GEORGE LYON, Chicago, Ill. Filed Mar. 14, 1889. Serial No. 303,205. (No model.)

Claim.—1. In a mattress-machine, the combination, with the frame and the nozzle, of a movable bed, a follower, a series of slats adapted to rest upon the material on the bed, a rock-shaft, to which said slats are secured, and hand mechanism for operating said shaft, and by which they are alone operated, substantially as set forth.

2. In a mattress-machine, the combination, with the frame and the nozzle, of the movable bed, the follower, a rock-shaft, a series of slats all separately and removably attached to said rock-shaft, and hand mechanism for turning said shaft and thereby moving said slats, and by which they are alone operated, substantially as set forth.

3. In a mattress-machine, the combination, with the frame and the nozzle, of a movable bed, a follower, a non-circular rock-shaft, and slats, each slotted at one end and slipped onto said rock-shaft, whereby it may be separately removed and replaced, substantially as set forth.

4. In a mattress-machine, the combination, with the frame and the nozzle, of a bed, a follower, the slats 41, the rock-shaft 37, to which said slats are secured, the segment 38 on said rock-shaft, the pinion 39, gearing with said segment, and the crank 40, substantially as set forth.

5. In a mattress-machine, the combination, with the frame and the nozzle, of the movable bed consisting of a belt, and a follower actuated by said belt, said bed and follower co-operating to expel the filling material from the nozzle, substantially as set forth.

6. In a mattress-machine, the combination, with the frame and the nozzle, of a movable bed consisting of a belt, and a follower removably attached to said belt, substantially as set forth.

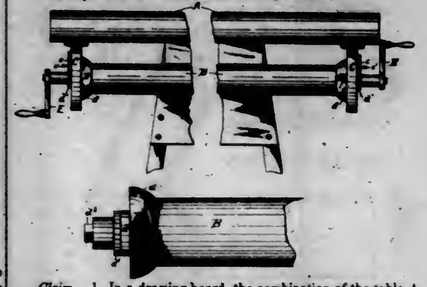
7. In a mattress-machine, the combination, with the frame and the nozzle, of a movable bed, and a follower actuated by said bed, said follower being sufficient in length to extend to the outer end of the nozzle when it has reached the limit of its movement, whereby the last bit of the charge of filling material is discharged from said nozzle, substantially as set forth.

8. In a mattress-machine, the combination, with the frame and the nozzle, of an endless belt constituting a movable bed, a follower attached to said belt, and slats adapted to rest upon the material on the bed, substantially as set forth.

9. In a mattress-machine, the combination with the frame and the nozzle, of an endless belt constituting a movable bed, a follower attached to said belt, slats adapted to rest upon the material on the bed, and the feed-roller 20, substantially as set forth.

10. In a mattress-machine, the combination, with the frame and the nozzle, of the rollers 2 and 3, a belt embracing them, a chain to which said belt is secured, and a follower attached to said chain, substantially as set forth.

11. In a mattress-machine, the combination, with the frame and the nozzle, of the rollers 2 and 3, the belt embracing them, the sprocket-wheels 4 4, the chains 7 7, embracing said wheels and to which said belt is secured, and the follower attached to said chains, substantially as set forth.



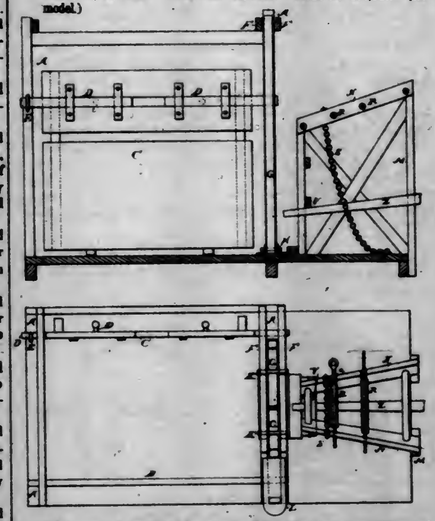
12. In a mattress-machine, the combination, with the frame and the nozzle, of the rollers 2 and 3, the belt embracing them, the sprocket-wheels 4 4 and 5, the chains 7 7 and 8, embracing said wheels and to which said belt is secured, and the follower attached to said chains, substantially as set forth.

13. In a mattress-machine, the combination, with the frame and the nozzle, of the rollers 2 and 3, the belt embracing them, the chains having lips to which said belt is secured, and the follower actuated thereby, substantially as set forth.

14. In a mattress-machine, the combination, with the frame and the nozzle, of the movable bed, the follower, and the angle-iron 19, situated between the bed and nozzle, substantially as set forth.

15. In a mattress-machine, the combination, with the frame, the nozzle, and an endless belt constituting the bed, of an adjustable side board, arms to which it is secured, and slides to which said arms are secured, said slides extending inward across the machine and between the two laps of the belt, substantially as set forth.

414,067. DRAWING-BOARD. JOHN L. MOORE, Washington, D. C. Filed Sept. 16, 1889. Serial No. 324,119. (No model.)

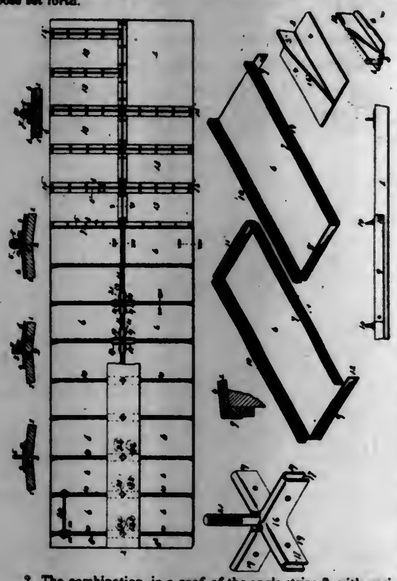


Claim.—1. In a drawing-board, the combination of the table A, bearing-plates C, having a pawl *c*, and the rollers B B', having ratchet *d'* on their end, substantially as set forth.

2. In a drawing-board, the combination of the table A, bearing-plates C, having a pawl *c*, and the rollers B B', revolving in said bearing-plates and having a cap D, provided with a shoulder *d*, ratchet *d'*, and projecting end d^3, substantially as set forth.

3. In a drawing-board, the combination of the table A, bearing-plates C, having a pawl *c*, rollers B B', having a cap D, provided with a shoulder *d*, which abuts against the inner side of the bearing-plate, a ratchet *d'*, projecting through and beyond the bearing-plate, and a squared projecting end d^3, and the key E, substantially as shown and described.

414,068. CHUTE FOR DEHORNING CATTLE. JAMES MOORE-HOUSE, Clyde, Kans. Filed Jan. 28, 1889. Serial No. 297,847. (No model.)



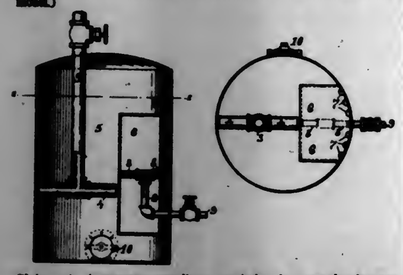
Claim.—1. A head-holding device for cattle chutes, consisting of the inclined flaring cheek-boards supported upon a frame and having perforations, the adjustable rest-rods, the fulcrum-bearings, lever, and chain, substantially as specified.

2. The combination, with the cattle-chute having the hinged folding side gate and the pivoted upwardly-extending neck-bars, of the head-holding frame, the inclined flaring cheek-bars supported thereon, and the adjustable rest-rods, substantially as specified.

3. The combination, with a cattle-chute having a side gate and pivoted neck-bars, of a head-holding receiver, its rest-rods, chain, and lever-bar, substantially as specified.

414,069. CAR-ROOF. PETER H. MURPHY, East St. Louis, Ill. Filed Aug. 3, 1889. Serial No. 319,684. (No model.)

Claim.—1. The combination, in a roof, of the angle-strips 3, adapted to be secured to the sheeting 1 and having a flange 5, and the plates 6, having flanges 7 and 10, substantially as and for the purpose set forth.



2. The combination, in a roof, of the angle-strips 3, with upright flanges 5, and the plates 6, having flanges 7, 8, 10, and 11, adapted for attachment to the angle-strips, substantially as set forth.

3. The combination, in a car-roof, of the angle-strips 3, the plates 6, having the flanges 7, 8, 10, and 11, and the corner-caps 16, all constructed and adapted to each other substantially as set forth.

4. The combination, in a roof, of the angle-strips 3, adapted for attachment to sheeting 1, and the plates 6, having marginal flanges adapted for engagement with the angle-strips, substantially as set forth.

5. The combination, in a car-roof, of the angle-strips 3, adapted for attachment to the sheeting 1, the plates 6, with marginal flanges adapted for engagement with the strips 3, and the corner-caps 16, having the studs 21, for engagement with the walk-sleepers, substantially as set forth.

414,070. PRESSURE-EQUALIZER FOR GAS-MAINS. PATRICK MCGEE, Providence, R. I. Filed July 1, 1889. Serial No. 316,181. (No model.)

Claim.—1. A pressure-equalizer consisting in a supply-pipe provided with lateral outlets opening into a large chamber, a smaller chamber connected with the larger by a series of openings, and a discharge-pipe having lateral openings in the small chamber, as described.

2. In a pressure-equalizer placed intermediate between a gas-engine and the gas-supply pipe, the combination, with the pipe 3, provided with the lateral outlets 4 4 and the chamber 5, of the chamber 6, provided with the openings 7, and the pipe 9, having the lateral inlets 8, as described.

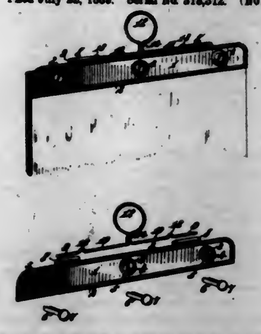
3. The combination, with the chamber 5, of the pipe 3 and lateral outlets 4, constructed to discharge the gas radially, the chamber 6, provided with the openings 7, and the pipe 9, having the lateral inlets constructed or placed so as to receive the gas through an annular opening at their ends, as described.

414,071. FASTENER FOR ENVELOPES. GEORGE W. MCGILL, Riverdale, N. Y. Filed June 22, 1889. Serial No. 315,174. (No model.)

Claim.—The duplex-pronged fastener herein described, consisting of two pairs of prongs projecting in the same direction from one side of a head composed of two superposed layers formed integral and the prongs of each pair respectively in close parallel contact, each layer of the head carrying a pair of the prongs, substantially as described.

414,072. FASTENER FOR ENVELOPES. GEORGE W. MCGILL, Riverdale, N. Y. Filed June 22, 1889. Serial No. 315,175. (No model.)

Claim.—The duplex fastener herein described, having two pairs of vertical prongs extending, respectively, from the opposite ends of a head composed of a strip of metal folded into two superposed layers, said head adapted to rest upon and parallel to the surface of the paper or other material to be secured and constituting a limiting abutment to the passage of both pairs of prongs laterally through the paper or other material, each pair of prongs adapted to be folded down, respectively, in planes parallel with the fastener-head, substantially as shown and specified.



414,073. FASTENER FOR ENVELOPES, &c. GEORGE W. MCGILL, Riverdale, N. Y. Filed June 22, 1889. Serial No. 315,176. (No model.)

Claim.—1. The fastening device herein described and shown, consisting of two duplex-pronged T-shaped fasteners having their heads formed integral with each other and placed back to back with the duplex prongs extending in reverse directions, and each pair of prongs adapted to be spread laterally to secure papers or other articles, substantially as set forth.

2. A fastening device consisting of two duplex-pronged T-shaped fasteners formed integral with a longitudinally-folded portion forming two heads placed back to back with the duplex prongs of one head extending in a direction opposite to the duplex prongs of the other head and both pairs of prongs adapted to be spread laterally, substantially as described.

414,074. SUSPENDING DEVICE. GEORGE W. MCGILL, Riverdale, N. Y. Filed July 22, 1889. Serial No. 318,312. (No model.)

Claim.—1. A suspending device consisting of a plate having a suspension ring or loop and a series of orifices or slots between its edges, and detachable duplex-pronged fasteners to pass through the article to be suspended and be spread laterally in opposite directions in the plane of the plate, substantially as described.

2. A suspending device consisting of a plate having a suspension ring or loop and formed with the annular beads 3, and seats 4, having orifices or slots 5, and detachable duplex-pronged fasteners having heads adapted to said seats, substantially as described.

3. A suspending device consisting of a plate having tubular portions and fasteners for securing the article to be suspended, and a hinged suspension ring or loop comprising a twisted neck or shank, and two arms respectively engaging the tubular portions, substantially as described.

4. A suspending device consisting of a plate having a series of orifices or slots and a pair of tubular portions, the duplex-pronged fasteners having heads and adapted to be removed and replaced, and a ring or loop having two arms extending along the plate, journaled in the tubular portions, and having shoulders to respectively bear against the latter and prevent undue lengthwise movement of the arms, substantially as described.

414,075. DEVICE FOR BRANDING CIGARS. IRVING PAINE, Hornellsville, N. Y. Filed Dec. 26, 1882. Serial No. 204,664. (No model.)

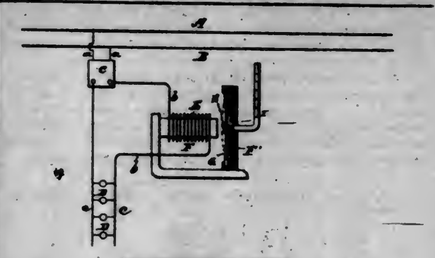
Claim.—1. In a device of the class described, the combination of two hinged sections, the lower one being provided with an adjustable die and the upper with a cigar-receiving opening or mold and adapted to press a cigar against the die, substantially as specified.

2. In a device of the class described, the combination of an upper and lower section, the latter provided with a die and a superimposed slotted spring and the former having a cigar-receiving mold and being adapted to press the cigar against the die, substantially as specified.

3. In a device of the class described, opposite hinged sections, one of which is provided with a die and a fixed knife and the other of which is designed to receive and press a cigar against the die, and is provided with a movable knife adapted to act with the fixed knife when the sections are closed, substantially as specified.

4. In a device of the class described, the combination, with a lower section having an opening and opposite longitudinal bores, of a die arranged in the opening and adjusting-rods arranged in the bores and adapted to adjustably support the die, substantially as specified.

5. In a device of the class described, the combination, with two hinged sections, one of which carries a die, of a superimposed spring slotted for the passage of the die and provided with a thimble adapted to receive the tack end of a cigar and compress or tack the same, substantially as specified.



6. In a device of the class described, the combination, with two hinged sections, one of which carries a die, of a superimposed spring slotted for the passage of the die and provided with a slotted overlapping thimble adapted to receive the tack end of a cigar and be compressed by the weight of the upper section, substantially as specified.

7. The bottom section 1, having the mold 5, in combination with the lower section 2, having the die 7, and the spring 17, bent at its ends, as at 18, and having the slot 19, substantially as specified.

8. The sections 1 and 2, the latter recessed, as at 6 and 9, in combination with the die 7, having the inclined walls 8, the intermediate depending stem 7×, mounted in the recess 6, and the opposite adjusting-rods 10, mounted in the recesses 9, and having beveled ends adapted to support and adjust the die by coacting with the inclined walls thereof, substantially as specified.

414,076. ELECTRIC-CURRENT INDICATOR. GUSTAV PFANHUSER, Cleveland, Ohio. Filed July 30, 1888. Serial No. 319,167. (No model.)

Claim.—In an electric-current indicator, the combination, with a magnet included in a circuit conveying an alternating, pulsating, or intermittent electric current, of a liquid-receptacle, an elastic diaphragm provided with an armature and connected with the liquid-receptacle, and an indicating-tube connected with the liquid-receptacle, said diaphragm and tube being arranged in a vertical position, substantially as set forth.

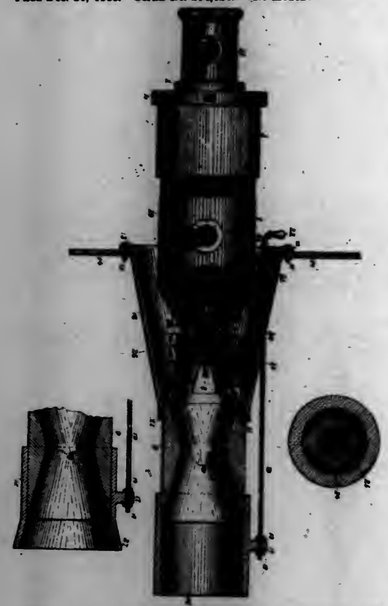
414,077. PACKING-BOX. PATRICK D. PIER, Brooklyn, N. Y. Filed Apr. 15, 1889. Serial No. 307,260. (No model.)

Claim.—A collapsible box composed of two parts A and B, both transversely grooved or creased and folded on four lines with overlapping ends, one part being placed within the other, with the overlapping flaps lying on contiguous exterior faces of the box, whereby when the box is closed the flaps may be held in closed condition by a suitable fastening, substantially as described.

414,078. TOOL-HOLDER. GEORGE RESPESS, MARTIN G. RESPESS, and JOHN G. RESPESS, Philadelphia, Pa., assignors to Henry D. Justi, same place. Filed Apr. 29, 1889. Serial No. 308,961. (No model.)

Claim.—1. A tool-holder consisting of a coiled spring connected with a casing and adapted to receive a tool and hold the same by contraction thereon, substantially as described.

2. A tool-holder consisting of a coiled spring, a casing containing said spring, and means for uncoiling or expanding the same, substantially as described.



3. In a tool-holder, a coiled spring and a rotatable sleeve connected therewith, in combination with a sliding sleeve which engages with said rotatable sleeve, the contiguous edges of the sleeves being spiral, substantially as described.

4. A coiled spring held at one end within a casing and connected at the other end with a rotatable sleeve, in combination with a sliding sleeve which engages with said rotatable sleeve, and a follower or plunger fitted to the casing adapted to operate said sliding sleeve, substantially as described.

5. A tool-holder consisting of a casing, a coil-spring having one end stationary, a rotary sleeve to which the other end of the coil is attached, and mechanism, substantially as described, for rotating said sleeve, said parts being combined substantially as described.

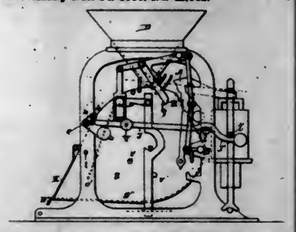
6. A tool-holder consisting of a casing, a threaded follower working in said casing, a sliding sleeve operated by movement of said follower, a rotary sleeve, said sliding and rotary sleeves having spiral contact edges, and a coil-spring having one end attached to said rotary sleeve and the other end bearing against a collar on the inner side of the casing, said parts being combined substantially as described.

414,079. **HYDROCARBON-BURNER.** JOSEPH REID, Oil City, Pa. Filed Dec. 26, 1888. Serial No. 294,626. (No model.)

Claim.—1. In a hydrocarbon-burner, the combination, with the furnace door or wall and the injector-nozzle projecting therethrough, of a supplemental nozzle forming a mixing-chamber secured to the inner end of said injector and having the stricture 10 remote from its ends, an adjustable sleeve or extension fitted to slide on said supplemental nozzle, and an operating-rod secured to said extension and projecting through said door or wall, substantially as set forth.

2. In a hydrocarbon-burner, the combination, with the furnace door or wall and the injector-nozzle for steam and oil projecting therethrough, of a supplemental nozzle secured to the inner end of said nozzle and having the stricture 10, a sleeve or extension fitted to reciprocate on said supplemental nozzle, and an operating-rod secured to said extension and adapted to project it beyond the end of the supplemental nozzle for increasing or to withdraw it even with the end of the supplemental nozzle for decreasing the length of the flame, substantially as set forth.

3. In a hydrocarbon-burner, the combination, with the furnace door or wall and the steam and oil injector nozzle projecting therethrough, of a supplemental nozzle secured to the inner end of said injector and having a flaring mouth and an adjustable sleeve or extension, also having a flaring mouth, fitted to reciprocate on said supplemental nozzle and adapted to be withdrawn on the supplemental nozzle to cause the two flaring mouths to meet or to be projected forward to increase the length of the flame, substantially as set forth.



4. In a hydrocarbon-burner, the combination, with the injector-nozzle for steam and oil, of the supplemental nozzle 9, secured thereto, a sleeve or extension fitted to reciprocate on said supplemental nozzle, the fixed guide 21, an operating-rod projecting through said guide and secured to said extension, and a shoulder on said rod for abutting against said guide to limit the movement of said extension, as set forth.

5. The combination, with the furnace door or wall having an orifice therein and the injector projecting therethrough, of a supplemental nozzle or extension secured to said injector and having a stricture at its mid-length and air-ports between said stricture and the end of said injector, a funnel extending from said supplemental nozzle backward over said ports and secured to said door or wall, an adjustable sleeve on said supplemental nozzle, a guide on said injector, and a rod projecting through said guide and funnel and secured to said sleeve, substantially as set forth.

6. The combination, with the furnace-door having an orifice and an injector projecting therethrough, of the supplemental nozzle or extension secured to said injector and having the air-ports 8 within the furnace and screw-threaded portion 11, and a funnel having a flange at its rear end secured to said door and internal screw-threads at its inner end engaging the threaded portion 11 between the inner end of said supplemental nozzle and the air-ports 8 therein, as set forth.

7. The combination, with the steam and oil pipes of a hydrocarbon-burner, arranged one within the other and each having the conical portions 31 32, tapering toward the mouth of the burner, and the cylindrical portion 33 intervening, of elongated ribs on the cylindrical portion of said inner pipe resting in the cylindrical portion of the outer pipe and having their ends beveled at an angle equal to the angle of the conical or bevel portion 32, against the inside of which in the outer pipe said beveled ends of said ribs are adapted to abut, whereby said pipes may be adjusted relatively to each other, and the inner pipe will always have bearing upon the cylindrical portion of the outer one, substantially as set forth.

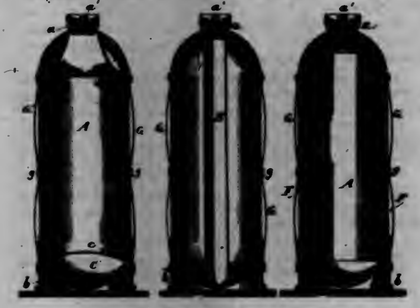
414,080. **AUTOMATIC WEIGHING APPARATUS.** MICHAEL E. REISERT, Hennef, Prussia, Germany, assignor to the Rheinische Maschinen-Fabrik C. Reuther & Reisert, same place. Filed Feb. 13, 1889. Serial No. 299,808. (No model.) Patented in England June 5, 1888, No. 7,554, and in Germany Dec. 24, 1886, No. 42,602.

Claim.—1. In an automatic weighing apparatus, the combination, with the frame, of the pivoted receptacle, the lever J J', fulcrumed on said frame, the weight C, with which said lever engages, and the overcharging-weight H, pivoted to said frame and engaging the end of said lever, substantially as set forth.

2. In an automatic weighing apparatus, the combination, with the frame, of the pivoted receptacle, the lever J, fulcrumed on said frame and having a weight at one end, and the overcharging-weight H, pivoted to said frame and having a roller at one end bearing on said lever, substantially as set forth.

3. In an automatic weighing apparatus, the combination of the pivoted receptacle, the hopper, the upper supply-flap, the scale-beam, the lever weighted at one end, and the pivoted weight H, engaging the other end of said lever, substantially as set forth.

414,081. **DIAPHRAGM FOR GALVANIC BATTERIES.** ISAIAH L. ROBERTS, Brooklyn, assignor to the Roberts-Brevoort Electric Company, (Limited,) New York, N. Y. Filed May 5, 1887. Serial No. 237,259. (No model.)

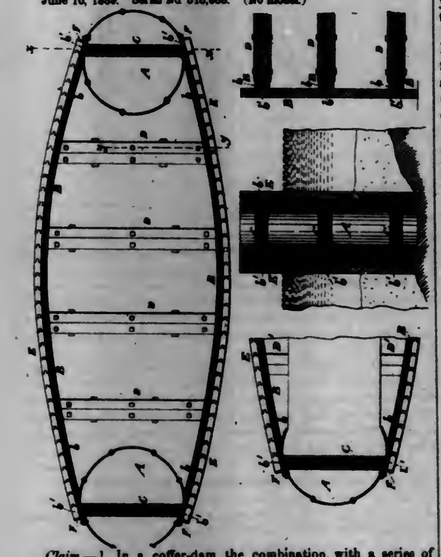


Claim.—1. A separating diaphragm or partition for an electric battery partially or wholly of mineral gelatinous material, substantially as described.

2. A separating partition or diaphragm for an electric battery, consisting of mineral gelatinous material combined with a holder, substantially as described.

3. A separating partition or diaphragm for an electric battery, consisting of a porous substance impregnated with mineral gelatinous material.

4. A separating partition or diaphragm for an electric battery, consisting of a porous substance having its pores closed with gelatinized silicate of soda or potash.

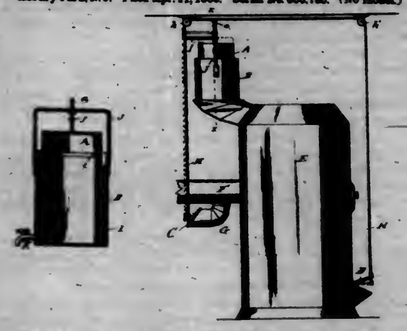


414,082. **CARRIER FOR HYDRAULIC TRANSIT.** JOHN E. ROBINSON, Philadelphia, Pa. Filed Mar. 8, 1889. Serial No. 302,652. (No model.)

Claim.—1. As a carrier for use in hydraulic transit, a can having a space for the reception of matter to be transported and a space forming a dead-air chamber, substantially as specified.

2. A can having curved springs on its exterior surface, said springs being secured at one end of the can and free to move longitudinally at the other end by compression, substantially as set forth.

414,083. **COFFER-DAM.** JOHN E. ROBINSON, Philadelphia, Pa. Filed June 10, 1889. Serial No. 313,683. (No model.)



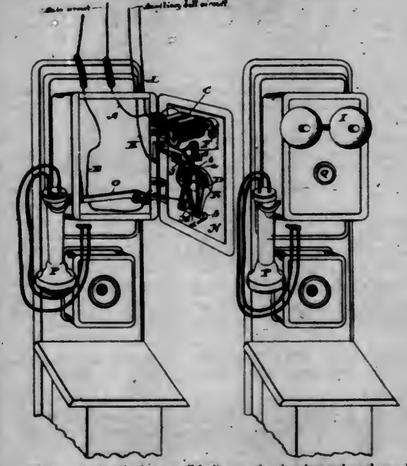
Claim.—1. In a coffer-dam, the combination, with a series of cylinders at a distance from each other, of arched whaling-pieces bolted to said cylinders on opposite sides and piling driven against the face of the whaling-pieces, substantially as described.

2. In a coffer-dam, the combination, with a series of cylinders at a distance from each other, of arched whaling-pieces bolted to said cylinders on opposite sides, piling driven against the face of the whaling-pieces, and braces extending from the whaling-pieces on one side to those opposite, substantially as specified.

3. In a coffer-dam, the combination, with a series of cylinders at a distance from each other, said cylinders being made of vertical sections bolted together, of arched whaling-pieces secured to said cylinders on opposite sides thereof, braces extending across the cylinders opposite the whaling-pieces, and piling driven against the face of the whaling-pieces, substantially as specified.

4. In a coffer-dam, the combination, with a series of cylinders at a distance from each other, of arched whaling-pieces bolted to said cylinders on opposite sides thereof, piling driven against the face of the whaling-pieces, and angle-irons to form an abutment for the end piles, substantially as specified.

414,084. **DRAFT-REGULATING DEVICE.** JOHN ROCKAFELLER, Asbury Park, N. J. Filed Apr. 11, 1889. Serial No. 306,763. (No model.)



Claim.—1. The combination, with the furnace having the dampers C and D and the wire H, connecting the said dampers, of the regulator placed close to and operated by the varying change of temperature of the said furnace, composed of the drums A and B, the drum B having an inner and an outer shell, between which a space I is left, and the drum A inverted and working in the said space I, which is filled with liquid to form a seal, the guide-yoke J, secured to drum B, the stem *a*, projecting from drum A and working through guide-yoke J, and the arm *j*, connecting stem *a* with the wire H, substantially as described.

2. The herein-described regulator, composed of two drums A and B, the drum B comprising two shells, between which a liquid seal is formed, the drum A being inverted and the upper edge of the inner shell of drum B being turned out or flared to guide the drum A in its movements and prevent splashing of the liquid into the inner shell of drum B, substantially as described.

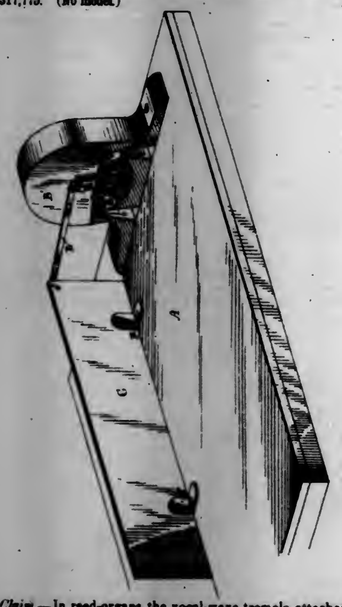
3. The combination, with the regulator comprising the two drums A and B, the drum B having two shells, between which a liquid seal is formed, of the drain-cock K, connected with the inner shell of drum B, substantially as described.

414,085. **ELECTRIC MECHANISM FOR OPERATING TELEPHONE CALL-BELLS.** FREDERICK W. A. SCHNEIDER, Toronto, Ontario, Canada. Filed Mar. 11, 1889. Serial No. 303,763. (No model.)

Claim.—1. A telephone call-bell, a main circuit passing through the coil of the magnet thereof, an auxiliary call-bell at a point remote from the telephone-bell, and a branch circuit leading from the telephone to the auxiliary call-bell, in combination with an automatic switch for directing the current from the main call-bell to the auxiliary call-bell, and a switch operated by the weight of the receiver for returning the current to its original course, substantially as described.

2. A telephone call-bell, a main circuit passing through the coil

of the magnet thereof, and a branch circuit to an auxiliary call-bell, in combination with a switch for automatically directing the current from the main call-bell to the auxiliary call-bell, and means, as the levers O G, for automatically changing the current back to its original course, substantially as described.



3. The wire A and wire L, connected to the magnet C, and the wire B, connected to the plate D, the spring E, arranged to form an electrical connection with the lever G and wire F, and the magnet C, in combination with the armature H, lever G, pin J, and wire K, arranged substantially as and for the purpose specified.

4. The wire A and wire L, connected to the magnet C, and the wire B, connected to the plate D, and the spring E, arranged to form an electrical connection between the plate D and the magnet C, in combination with an armature H, lever G, pin J, wire K, and air or oil cushion formed by the cylinder M, arranged substantially as and for the purpose specified.

5. The pivoted lever O and the pivoted lever G, arranged to engage with a notch in the armature H and to project over the pivoted lever O, in combination with the circuit making and breaking spring E, arranged substantially as and for the purpose specified.

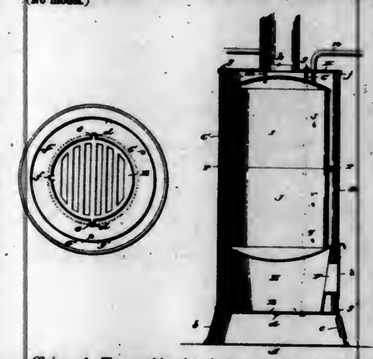
6. The pivoted indicating-plate R, having a weighted arm S fixed to it and designed to extend over the pivoted lever O, in combination with the pins *a* and *b*, arranged substantially as and for the purpose specified.

414,086. VOCAL-WAVE TREMOLO FOR REED-ORGANS. FRANK T. SHEARER, Clinton, Ontario, Canada. Filed July 17, 1889. Serial No. 317,775. (No model.)

Claim.—In reed-organs, the vocal-wave tremolo attached to the reed-board by flexible hinges and to the crank of the fan by a connecting-rod, all substantially as and for the purpose described.

414,087. WASHING-MACHINE. HAMILTON R. SMITH, New York, N. Y. Filed May 17, 1888. Serial No. 274,214. (No model.)

Claim.—1. The combination, with the casing A and its cover, of a fixed rack secured to the casing, and a gear-wheel on said cover engaging with the rack, whereby the rotation of the gear opens or closes the cover, substantially as shown and described.



2. The combination, with the casing A, having curved ways formed therein and a curved cover guided in said ways, of a rack formed on the casing, a shaft having bearings on the cover, and gear-wheels rigidly mounted on said shaft and engaging with said rack, substantially as shown and described.

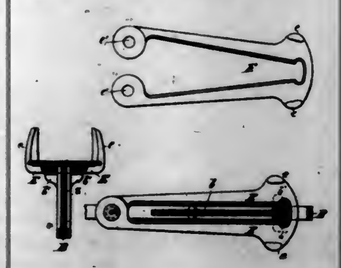
3. The combination, with the casing A and its cylinder B, of the overflow-pipe K, having a connection with the interior of the casing in the periphery thereof, substantially as shown and described.

4. The combination, with the casing A, of the horizontal overflow-pipe K and the branches *l* thereof, connecting with the interior of the casing at its periphery, substantially as shown and described.

5. The combination, with the casing A, of the horizontal overflow-pipe K and the branches *l* thereof, connecting with the interior of the casing and with the highest portion of the overflow-pipe, substantially as shown and described.

414,088. AGRICULTURAL BOILER. HOSEA B. STAFFORD and HENRY W. SALS, Manson, Iowa. Filed July 26, 1888. Serial No. 318,967. (No model.)

Claim.—1. The combination, in an agricultural boiler, of a base-casting suspended upon a flange forming an ash-pit, and centrally perforated and notched, as described, of a grate having lugs to engage said notches, and an independent fire-box resting on said base and spanning said notches, substantially as set forth.



2. The combination, in an agricultural boiler, of a base having a grate-opening and grate mounted thereon, a casing secured to said base by vertical internal rods secured to said base, and an independent fire-box resting on said base and positioned by said rods, substantially as set forth.

3. The combination, in an agricultural boiler, of a base having a grate-opening, a vertical cylindrical casing supported thereon, a top plate, and vertical rods internally securing said casing to said base, and a boiler suspended from the top plate, substantially as set forth.

4. The combination, in an agricultural boiler, of a base and cylindrical casing mounted thereon, a top plate, and vertical rods securing the plate and casing to said base, and a fire-box and suspended boiler positioned by said rods, substantially as set forth.

414,089. SKATE. WILLIAM A. SUTTON, New York, N. Y. Filed Aug. 7, 1889. Serial No. 320,050. (No model.)

Claim.—1. The combination, in a skate, of a forked heel-clamp, the shanks of which are passed over the rear portion of the runner and then riveted together, with a heel-plate cast in one piece with the runner and sole-plate, substantially as set forth.

414,089.

2. In a skate, the combination of a forked heel-clamp, the shanks of which are passed over the rear portion and then riveted together, with the lever-and-clamp device for the sole and heel plates, substantially as set forth.

3. The forked heel-clamp for skates, having shanks provided at their terminating ends with eyes, substantially as set forth.

4. In a skate, the combination of the lever, riveted with an ordinary rivet to the front end of the heel-clamp, and also riveted with an ordinary rivet to the flattened end of the screw-bolt connecting the sole-clamps, substantially as set forth.

414,090. DRAW-PLATE. WILLIAM TAYLOR, Allegheny, Pa. Filed Dec. 12, 1888. Serial No. 293,411. (No model.)

Claim.—1. For the purpose of manufacturing wire by successive passes, a draw-plate provided with a series of separate holes each differing from the other in shape or form and having the same diameter or breadth between the widest-separated portions or extreme points of outline.

2. For the purpose of manufacturing wire by successive passes, a draw-plate provided with a series of separate holes each differing from the other in shape or form and having the same extent of outline and the same diameter or breadth between the widest-separated portions or extreme points of outline.

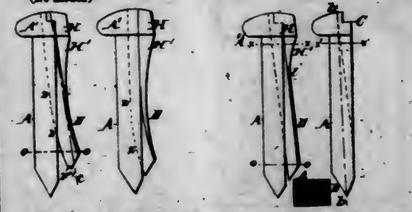
3. For the purpose of manufacturing wire by successive passes, a draw-plate provided with a series of separate holes each of the same diameter and having parts which conform to the shape of the initial wire and other intermediate parts which vary from said shape and successively vary from each other in their widths.

4. For the purpose of manufacturing wire by successive passes, a draw-plate having a series of holes bounded partly by segments of a circle with intermediate parts of other and different shape which successively vary from each other in their widths.

5. For the purpose of manufacturing wire by successive passes, a wire-drawing mechanism having a series of apertures of which one or more have walls with parts thereof conforming to the initial form of the wire and parts intermediate of those aforesaid which are nearer together than the corresponding parts of the initial wire, substantially as set forth.

6. For the purpose of manufacturing wire by successive passes, a wire-drawing mechanism having a series of apertures each formed with walls having parts which conform to the shape of the initial wire and other intermediate parts which vary from the said shape, the said intermediate parts varying successively from each other in their width, substantially as set forth.

7. For the purpose of manufacturing wire by successive passes, a wire-drawing mechanism having a series of apertures of which one is circular in section, another is triangular, and one or more others are bounded partly by the arcs of a circle and partly by intermediate lines which when extended form a triangle, substantially as set forth.

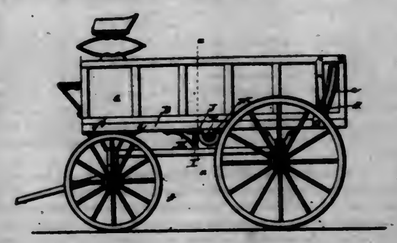


414,091. WAGON-LOCK. FREDERICK M. TWEAT, Shiloh, Ga. Filed Mar. 18, 1889. Serial No. 303,725. (No model.)

Claim.—1. A wagon-lock consisting of the hollow slide-bearing block adapted to be connected to a chain and having at its lower end a pivoted hook provided with a curved extension, a locking slide-bar in said slide-bearing block, and a bent lever connected to the locking-bar, substantially as specified.

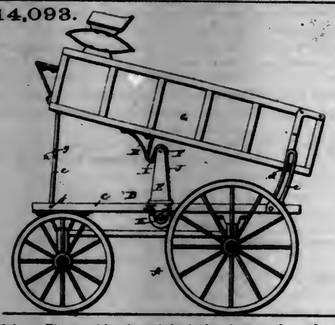
2. The combination, with the hollow slide-bearing block and its pivoted hook having a curved extension, of the locking slide-bar slotted at its upper end, and the lever pivoted in said slot and having the handle-arm extending upward and the catch-arm extending toward the slide-bearing block, substantially as specified.

414,092. RAILROAD-SPIKE. WILLIAM D. TWEEDDALE and ROBERT M. GOODWYN, Forsyth, Ga. Filed Jan. 31, 1889. Serial No. 298,257. (No model.)



Claim.—1. A spike or nail consisting of a main nail having a groove in one side thereof and a key partially resting within the groove, the longitudinal axis of the main nail and key being at an angle with each other, as and for the purpose described.

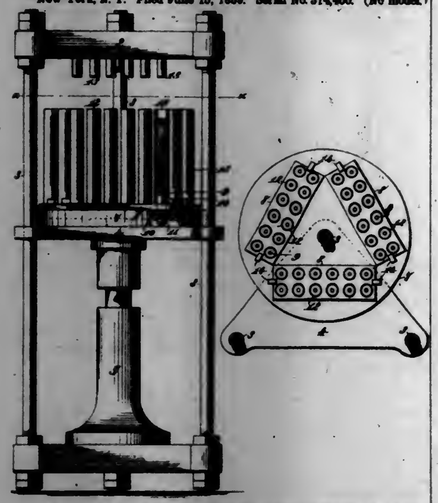
2. A spike or nail consisting of a main nail having a groove in one side thereof, the bottom of the said groove being at an angle with the axis of the main nail and of a key partially resting within the said groove, as and for the purpose described.



3. A spike or nail consisting of a main nail having a groove in one side thereof and a key partially resting within the said groove, the longitudinal axis of the main nail and key being at an angle to each other, the said parts having shoulders and ears respectively formed thereon, as and for the purpose described.

4. A spike or nail consisting of a main nail having a groove in one side thereof and a key partially resting within the said groove, the longitudinal axis of the main nail and the key being at angles to each other, and the said groove having a leg in the bottom thereof and a corresponding recess in the key, as and for the purpose described.

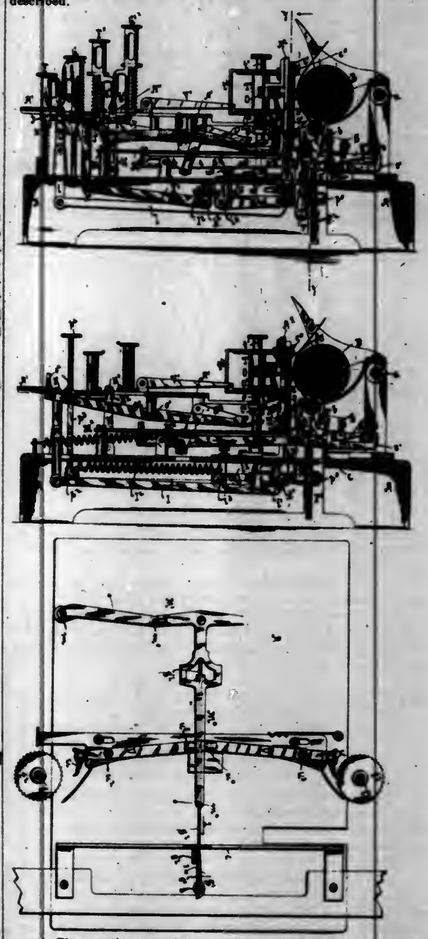
414,093. DUMPING-WAGON. JAMES P. VAN WYCK, Hudson, N. Y. Filed July 24, 1888. Serial No. 318,544. (No model.)



414,093.

Claim.—The combination of the bed or bottom frame having side standards E and bearings or boxes for the revolving shaft L L', the hoisting-shaft L L', constructed as described, and provided with hoisting-drums K K, the hoisting-chains J, the movable wagon box or body provided with the hangers H, the curved end guides *e*, adapted to engage guide-bolts projecting from opposite sides of the wagon box or body, and the forward jointed braces *e*, all constructed and combined to operate substantially in the manner and for the purpose shown and set forth.

414,094. MACHINE FOR CHARGING FIRE-WORKS. Claudius Wadsworth, Brooklyn, assignor to the Unexcelled Fireworks Company, New York, N. Y. Filed June 15, 1889. Serial No. 314,400. (No model.)



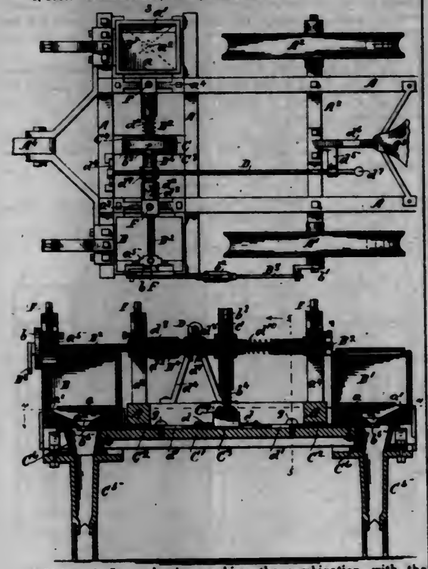
Claim.—A machine for charging fire-works, consisting of a head-plate having a row of rammers, standards supporting the head-plate, a platen rising and falling on the standards, a rotating table journaled on one of the standards, a series of lifting-plates arranged in a triangle on the rotating table, and a series of spindles secured in a fixed position to the rotating table and loosely passing through each one of the lifting-plates, substantially as described.

414,095. TYPE-WRITING MACHINE. Frank X. Wagner, New York, N. Y. Filed July 26, 1888. Serial No. 281,101. (No model.)

Claim.—1. The combination, with a type-carrier movable in a right line, of the lever system M M°, the cam-levers L L', engaging said lever system, a connection between the lever system and the type-carrier, and a key for each cam-lever, whereby the depression of a key actuates the type-carrier, substantially as shown and described.

2. The combination, with a type-carrier containing two or more rows of type, of a main key-rod connected with the carrier, as described, and a secondary key-rod connected with the main rod, and keys engaging with said rods, whereby the movement of the secondary key-rod is conveyed to the main rod, substantially as described.

3. The combination, with a carrier containing two or more rows of type, of guides C C, for guiding the carrier in a rectilinear path, the arms J J', and the lever-frame i^3, supporting said guides, a rod H, carried by pivoted arms A, keys F G, &c., provided with cam-faces *f* and *g*, respectively, the lever *i*, and slide I, provided with inclined slot engaging a rod on the lever-frame i^3, substantially as shown and described.



4. The combination, with a carrier provided with movable types and guided to move in a right line, of a hammer guided in bearings at right angles to the carrier, the key-rod H, a lever O', engaging said hammer, and a lever O^3, having cam-surfaces o^3 o^3, engaging with the key-rod and with the lever O', substantially as shown and described.

5. The combination, with the type-carriers D D' and the guides C C' for the same, of the slides P and Q, the shifter R, engaging the guide C' and engaged by the slide P, sockets q^3 q^3 on the slide Q, engaging the carrier, and means for imparting a reciprocating movement to one of the slides, substantially as shown and described.

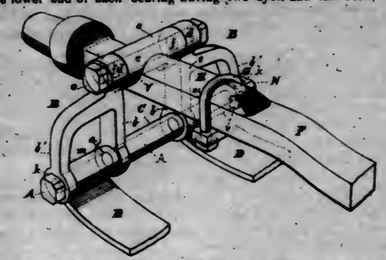
6. The combination, with the ribbon-spools and the toothed wheels connected therewith, of the pawl-bearing levers U U', mounted on an adjustable carrier and united by a common pin u^4, and a reciprocating slide S^2, engaging with said pin, substantially as shown and described.

7. In a type-writing machine, the combination of two rising and falling parallel guides C C, a type-carrier fitted to said guides to move in a right line thereupon and having a series of type-bars, each containing two types, and two sets of keys, F and G, and connections, substantially as described, for respectively moving the type-carrier back and forth in a right line on the guides and lowering and raising the same to bring the upper and lower rows of type into the printing-line.

414,096. AUTOMATIC SEED-PLANTER. William J. Waller, Chicago, Ill., assignor of one-half to Henry Wulf, same place. Filed Jan. 8, 1889. Serial No. 295,797. (No model.)

Claim.—1. In a planting-machine, the combination, with the driving-shaft, of a sleeve-hub loosely mounted thereon, the disk-wheel rigidly mounted on said sleeve, the pin or pins projecting from the periphery of said wheel, the spring lying in the pathway of the disk-wheel and adapted to be compressed by the contact of said pin or pins, the seed-slides and spring, and the clutch mechanism for controlling the action of the disk-wheel, substantially as and for the purpose set forth.

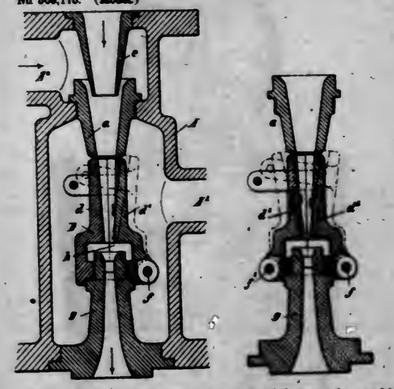
2. In a planting-machine, the combination, with a rotating disk or operating-wheel provided with one or more projecting pins, as described, of an elliptic spring located underneath and in the pathway of said wheel, the seed-slides, the links for pivotally connecting said spring and slides, whereby the contact of the pin or pins set in the disk-wheel has the effect of compressing the spring and moving the slide to uncover the seed-openings in the bottoms of the seed-boxes, substantially as and for the purpose set forth.



3. In a two-row planting-machine, the combination, with the seed-boxes of the seed-slides, the outer ends of which pass under the exterior bottom of said boxes and normally close the seed-apertures in the same, of the elliptic spring and the links pivotally connecting said slides and spring, whereby the spring when compressed moves the slides to uncover the seed-openings and normally closes the same when the pressure is removed, substantially as and for the purpose set forth.

4. In a planting-machine, the combination, with the seed-boxes, of the transverse bar connecting the same, the seed-slides rabbeted in the upper side of said bar, the plate C^3, the elliptic spring, the links *d d d d*, the disk-wheel provided with projecting pins, as described, the sleeve on which said wheel is mounted, and the driving-shaft, substantially as and for the purpose set forth.

5. In a planting-machine, the combination, with the driving-shaft, of the screw-threaded bolts for the vertical adjustment of said shaft, a crank-wheel rigidly secured on said shaft, the sulky-wheel and a crank-wheel rigidly secured to the hub thereof, the rod formed in two parts and connecting said crank-wheels, and the right and left threaded nut for adjustably joining the inner ends of said rod, substantially as and for the purpose set forth.



414,097. SPRING-HANGING DEVICE. James Wiser, Springfield Centre, N. Y. Filed June 20, 1889. Serial No. 316,099. (No model.)

Claim.—The duplex spring-hanger consisting of the notched T-shaped attachment, its cross portion being hollow or tubular, the end bifurcated pendent bearings, each bearing comprising two arms or pendants, one extending laterally from the other and downwardly, and the upper end of each pendent bearing having a single eye, and the lower end of each bearing having two eyes, and the bolts, one

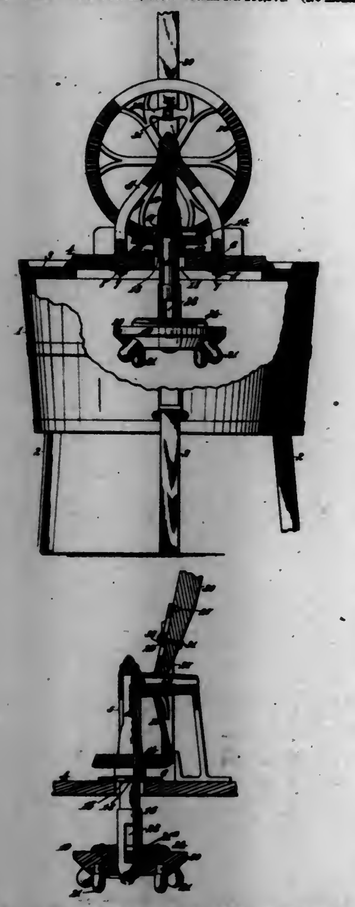
passing through the upper eyes of the said bearings and the tubular portion of said T-shaped attachment, and the other bolt passing through the lower eyes of said bearings and the sleeve or tube interposed between the inner arms of said bearings, substantially as set forth.

414,098. INJECTOR. Otto Westphal, Hamburg, Germany, assignor to Weber & Westphal, same place. Filed May 1, 1889. Serial No. 309,175. (Model.)

Claim.—1. As an improvement in steam-injectors, the combination, with the lifting and discharging cones, of the combining-cone having a pivoted section secured at its lower end to said discharging-cone and extending to said lifting-cone, substantially as set forth.

2. As an improvement in steam-injectors, the combination, with the lifting and discharging cones, of the sectional combining-cone having a hinged part or parts secured at their lower ends to the upper end of said discharge-cone, substantially as set forth.

414,099. COMBINATION TRUNK-STRAP AND CATCH. Samuel J. White, Wellsborough, Pa. Filed Apr. 12, 1889. Serial No. 306,996. (No model.)



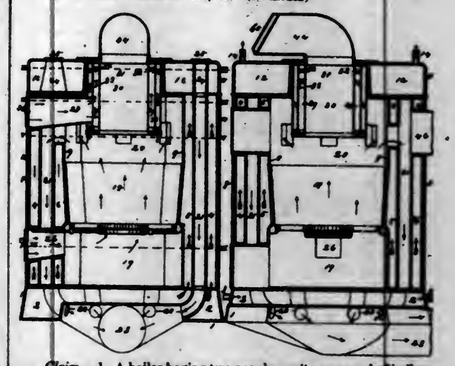
Claim.—1. A trunk-strap fixed to the surface of the trunk with a hinge between its ends, and having a housing provided with a pivoted hooked catch fixed at one end of said strap, in combination with a slotted bolt fixed at the other end of said strap, substantially as specified.

2. A trunk-strap having a slotted housing fixed at one end thereof, a hooked catch pivoted thereto adapted to project into said slot and having flat faces, and a spring pressing against said end to hold it closed or open, as described, in combination with a second housing fixed to the other end of said strap, and a slotted bolt fixed therein, said slot located to register with that in the first housing, substantially as specified.

3. A strap or band attached to a trunk by suitable securing devices, and a slotted housing fixed at one end thereof, a hooked catch pivoted therein adapted to project into said slot and having flat faces, and a spring pressing against said faces to hold it open or closed, as described, in combination with a second housing fixed to the other end of said strap, and a slotted bolt fixed therein, said slot located to register with that in the first housing, substantially as specified.

4. The combination, with the strap, of the bolt D, secured to one end of the strap and having a lug D' fitting a hole in the strap, the housing C², secured to the strap and bolt, the housing C, secured to the other end of the strap, and the spring-actuated catch pivoted in the housing C, substantially as described.

414,100. WASHING-MACHINE. ALBERT C. F. WICHMAN, Fort Wayne, Ind. Filed Feb. 12, 1889. Serial No. 299,571. (No model.)

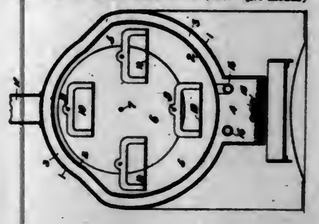


Claim.—1. The combination, with the lid of a washing-machine, of the arch secured to the lid and cast integral with the lateral journal, the metallic shaft cast integral with the miter-gear and the socket and having its upper end journaled in the center of the arch, the metallic plate on the lid serving as a bearing for the lower end of the metallic shaft, the wooden dasher-carrying shaft having its upper end secured in the socket of the shaft cast with the miter-gear, and the miter-gear mounted loosely on the journal cast with the arch, substantially as described.

2. The combination, with the lid of a washing-machine having an attached metallic plate provided with a central orifice, of the arch cast integral with a central vertical socket-bearing and a horizontally-projecting journal, the metallic shaft seated at its upper end in the socket of the arch and cast integral with the miter-gear, the central vertical socket, the annular collar and the annular shoulder, and the miter-gear loosely mounted on the journal cast with the arch, substantially as described.

3. The combination, with the tub and lid of a washing-machine, of the arched frame 5, cast integral with the horizontal journal 25, the shaft 10, journaled at its upper end in the arched frame and cast integral with the miter-gear 14 and vertical socket 12, dasher-carrying shaft 16, secured within said socket, and the miter-gear 26, loosely mounted on the journal cast with the arched frame, substantially as described.

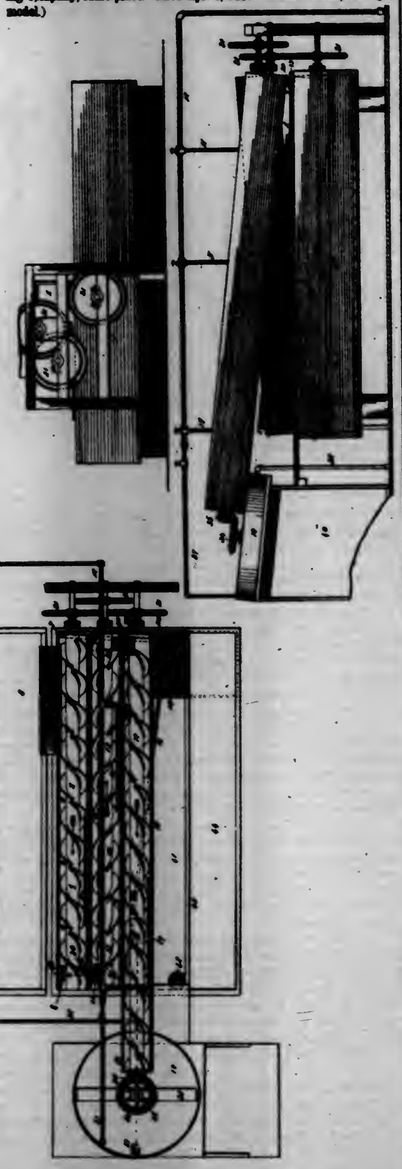
414,101. BOILER. JACOB S. WILLIAMS, St. Louis, Mo. Filed Apr. 24, 1888. Serial No. 271,722. (No model.)



Claim.—1. A boiler having two annular walls composed of hollow sections, water-chambers above and below communicating with the chambers in the sections, and an annular flue between the walls for the passage of the products of combustion.

2. The combination, in a boiler, of two concentric walls containing water-chambers, in connection with water-spaces above and below, and an annular descending flue between the walls, substantially as set forth.

3. The combination, in a boiler, of two concentric annular walls, each composed of similar hollow sections, the sections having parallel curved inner and outer sides and fitted together at the edges with vertical joints, an annular flue between the two walls for the passage of the products of combustion, and water-chambers above and below in communication with the chambers within the sections.

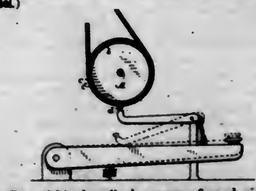


4. The combination, in a boiler, of a central magazine for the downward feed of the fuel, two annular walls formed of similar hollow sections concentric with the magazine, and the walls so far set asunder and from the magazine as to form annular flues between the two walls and the inner wall and magazine, the lower end of the outer flue being in communication with the chimney, and the lower part of the inner flue being in communication with the combustion-chamber, and the flues being in communication with each other at top, and water-chambers above and below in communication with the chambers of the hollow sections, all substantially as set forth.

414,102. BAKE-OVEN. JAMES M. WRIGHT, McKee's Rocks, Pa. Filed May 13, 1889. Serial No. 311,236. (No model.)

Claim.—The combination of the exterior combustion-chamber 3, the interior baking-chamber 5, the inclosed rotary frame carrying baking-pans, the furnace at the base of the heating-chamber, a flue 15 for the waste products of combustion, air-inlet pipes 16 traversing the combustion-chamber in opposite directions and entering the bottom of the baking-chamber at opposite ends thereof, an outlet-pipe 17 leading from the top of the baking-chamber at or near the middle thereof and entering the said flue 15, and a damper controlling the outlet-pipe 17, substantially as and for the purpose described.

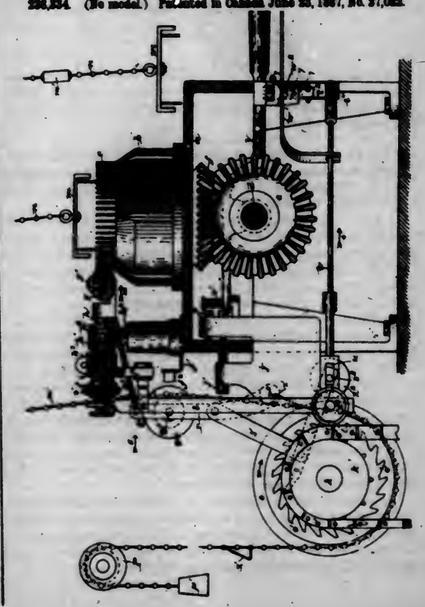
414,108. MACHINE FOR WASHING ORES. HENRY WUERDE, St. Louis, Mo., assignor to the Page & Krauss Manufacturing and Mining Company, same place. Filed Apr. 1, 1889. Serial No. 305,592. (No model.)



Claim.—1. In a machine for washing ores, &c., the combination of troughs provided with conveyers and inclined in opposite directions, and pipes for discharging the water into the troughs, substantially as and for the purpose set forth.

2. In a machine for washing ores, &c., the combination of the troughs inclined in opposite directions, conveyers located within the troughs, pipes for discharging water into said troughs, and discharge-pipes extending a distance into the troughs, whereby the water in the troughs is maintained at a given level and the ore kept constantly immersed, substantially as and for the purpose set forth.

3. In a machine for washing ores, &c., the combination of the oppositely-inclined troughs, conveyers located in the troughs, and pipes for discharging water into the troughs and conveying it therefrom, said troughs having direct communication with each other at opposite ends, whereby the ore is kept constantly on the ascent against the action of the water, substantially as and for the purpose set forth.



4. In a machine for washing ores, &c., the combination of the oppositely-inclined troughs having communication with each other, conveyers located within the troughs, pipes for discharging water into and conveying it from the troughs, and a sieve into which the pipes carrying the water from the troughs deliver, substantially as and for the purpose set forth.

414,104. METHOD OF PRODUCING STENCILS, &c. WILLIAM H. COTTRELL, Farmington, Me. Filed Jan. 15, 1889. Serial No. 296,695. (No model.)

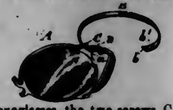
Claim.—The within-described process of producing a stencil or pattern for printing or marking, which consists in placing on a roller provided on its surface with points, projections, or other cutting-edges a waxed or other suitable paper and over that a thick paper, and then by the blows of the type apparatus of an ordinary type-writer perforating the inner paper with the desired letters, figures, or other patterns, substantially as described.

414,105. CIRCULAR-KNITTING MACHINE. EDGAR C. COVELL and ELISHA S. CRAM, Laconia, N. H. Filed May 16, 1887. Serial No. 238,234. (No model.) Patented in Canada June 28, 1887, No. 37,022.

Claim.—1. The combination, with the needles and their cylinder or head, of a stitch-wheel, a supporting-rod for the same, a spring for normally holding said stitch-wheel and its supporting-rod pressed toward the needles, a lever *l*, engaging at one end the stitch-wheel-supporting rod, a sprocket-wheel, a pattern-chain on said wheel adapted to engage the other end of said lever and draw the stitch-wheel backward from the needles, and means for rotating the needle cylinder or head and said sprocket-wheel, substantially as and for the purposes set forth.

2. The combination, with the needle-cylinder and needles, of the stitch-wheel, means, substantially as described, for gradually varying the position of the stitch-wheel with respect to the needles, and a knocking-over wheel and its support, and a spring for holding the knocking-over wheel pressed yieldingly toward the needles, as set forth.

3. The combination, with the needle-cylinder and needles, of a take-up head, a pull-up cord or chain attached to said take-up head, a pulley over which said chain or cord runs, and a weight *m'*, attached to said cord or chain above the take-up head and between the latter and said pulley, substantially as set forth.



4. The combination, with the bed or frame and the needle-cylinder and needles, of a pull-up cord or chain, a wheel *o*, around which said cord or chain is adapted to pass, said wheel having a rim provided with notches *o'*, an arm *r*, pivoted to the frame and provided with a wheel or bowl *q*, a spring *n'*, a pawl *s*, and link *s'*, connecting said pawl with said arm, as set forth.

5. The combination, with the bed or frame, the needle-cylinder and needles, of a pull-up cord or chain, lever or arm *r*, pivoted to the bed or frame and provided with roller or wheel *q*, a spring *n'*, and a finger *f''*, as set forth.

6. The combination, with the bed or frame, the needle-cylinder and needles, gear *f* on the needle-cylinder, the driving-shaft, gearing connecting said gear *f* with the driving-shaft, and shipping mechanism for disconnecting said gear *f* from the driving-shaft, of a pull-up cord or chain, a wheel *o*, provided with ratchet-notches *o'*, arm *r*, bowl or roller *q*, pawl *s*, link *s'*, spring *n'*, forked rod *t*, and mechanism intermediate of said rod and said shipping mechanism, as set forth.

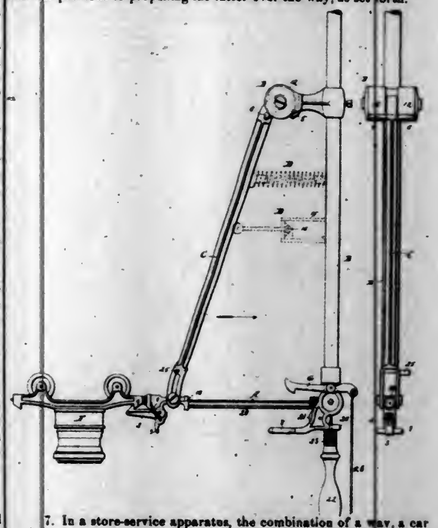
7. The combination, with the needle-cylinder and needles, the stitch-wheel and its supports, a spring for holding it yieldingly pressed toward the needles, pull-up cord or chain *n*, bracket *j*, wheel *o*, shaft *k*, wheel *k'*, chain *o'*, and lever *l*, provided on its lower end with roller or bowl *P*, and connected at its upper end with the stitch-wheel support, as set forth.

414,106. EYEGLASSES. ALBERT A. COWING, Watkins, N. Y. Filed June 21, 1889. Serial No. 315,109. (No model.)

Claim.—In eyeglasses, the two screws C D, working in projections *a a* of the eye-frames, in combination with a spring B, having a slot *b* and an adjacent screw-hole *b'* on each end thereof, as and for the purpose set forth.

414,107. STORE-SERVICE APPARATUS. JAMES T. COWLEY, Lowell, Mass., assignor, by mesne assignments, to the Lamson Consolidated Store Service Company, of New Jersey. Filed May 27, 1887. Serial No. 239,553. (No model.)

Claim.—1. In a store-service apparatus, the combination, with a way and a car supported by said way, of a pivoted spring-actuated propelling-arm adapted to impart a propulsive force to the car, a catch for coupling the arm and car together, and a retractor for simultaneously drawing back the arm and car previous to propelling the latter over the way, substantially as described.



2. In a store-service apparatus, the combination, with a way and a car supported by said way, of a pivoted spring-actuated propelling-arm carrying a catch for engagement with the car and adapted to impart a propulsive force to the car, substantially as described.

3. In a store-service apparatus, the combination, with a way and a car supported by said way, of a pivoted spring-actuated propelling-arm carrying a slide running on said way, against which slide the car abuts, said arm being adapted to impart a propulsive force to the car, a catch for coupling the slide and car together, and a retractor for simultaneously drawing back the arm and car previous to propelling the latter over the way, as set forth.

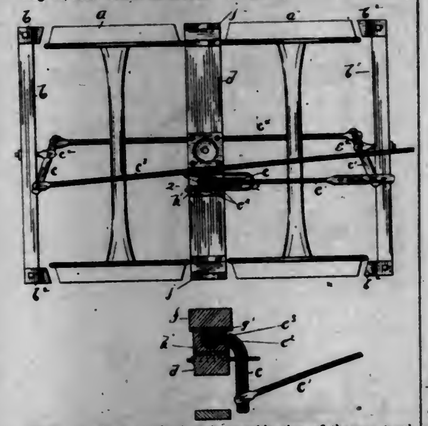
4. In a store-service apparatus, the combination, with a way and a car supported by said way, of a pivoted spring-actuated propelling-arm carrying a slide mounted on the way, said slide having a catch for engagement with the car, and said arm adapted to impart a propulsive force to the car, substantially as described.

5. In a store-service apparatus, the combination of a way, a car supported by said way, a pivoted spring-actuated propelling-arm adapted to impart a propulsive movement to the car, a catch for coupling the arm and car together, a catch for temporarily holding said arm in its retracted position, and a retractor for simultaneously drawing back the arm and car previous to propelling the latter over the way, as set forth.

6. In a store-service apparatus, the combination of a way, a car supported by said way, a pivoted propelling-arm, and an impelling device by which the arm is vibrated in one direction to impart a propulsive movement to the car, a catch for coupling the arm and car together, and a retractor for simultaneously drawing back the arm and car previous to propelling the latter over the way, as set forth.

7. In a store-service apparatus, the combination of a way, a car supported by said way, a pivoted propelling-arm, and a spring by which the arm is vibrated in one direction to impart a propulsive movement to the car, a catch for coupling the arm and car together, and a retractor, whereby the arm and car are simultaneously retracted previous to propelling the car over the way, as set forth.

8. The combination, with the way and a car running on said way, of a pivoted arm C, carrying at its free end a slide 10, mounted on the way and having a pivoted catch-arm for engagement with the car, a cord extending in position to be grasped by the attendant and adapted to vibrate the arm in one direction, and an impelling means for exerting energy upon said arm, substantially as described.



9. The combination, with the way and a car running on said way, of a pivoted arm C, carrying at its free end a slide 10, mounted on the way and having a pivoted catch-arm for engagement with the car, a cord extending in position to be grasped by the attendant and adapted to vibrate the arm in one direction, a catch for holding the arm in its retracted position, and an impelling means for exerting energy upon said arm, substantially as described.

10. In a store-service apparatus, the combination, with a way and a car supported by said way and adapted to travel thereon, of a pivoted spring-actuated arm adapted to act as a buffer to arrest the momentum of the car and to impart a propulsive force to the car, a catch 2, for holding the car in connection with the arm, and a tripper for releasing the catch, whereby the car is impelled over the way, substantially as described.

11. In a store-service apparatus, the combination, with a way and a car supported by said way and adapted to travel thereon, of a pivoted spring-actuated arm adapted to act as a buffer to arrest the momentum of the car and to impart a propulsive impulse to the car, a catch for holding the arm and car together, a tripper for releasing the car from the arm, and a second catch for holding the arm and car in their rearward position, substantially as described.

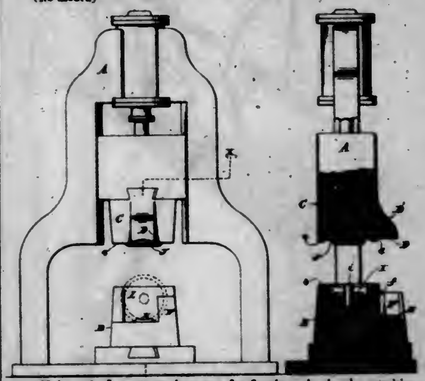
12. In a store-service apparatus, the combination of a way, a car traveling on said way, a spring-actuated arm pivotally mounted at one end, its other or free end adapted to be vibrated in the direction of the way to impart a propulsive impulse to the car and to act as a buffer to arrest the momentum of the car, a catch 2 to hold the car in connection with and in position to be acted upon by said arm, and a tripper for releasing the car upon the propulsive movement of the arm, substantially as set forth.

414,108. CAR-BRAKE. THERON S. R. DIXON, Chicago, Ill. Filed Aug. 10, 1889. Serial No. 320,382. (No model.)

Claim.—1. In a car-brake, the combination of the car-truck with a lever attached between its ends to a brake-beam and having one end connected to a rod, chain, or bar by which exterior power is transmitted to set the brakes and the other end connected to a device held in normal position by the weight or a portion of the weight of the car and adapted to yield when the force applied to it attains a predetermined relation to said weight, whereby the exterior power transmitted to set the brakes is limited in its effect to a maximum determined by the weight of the car, substantially as described.

2. In a car-brake, the combination of the truck and brake-beams with a first and second lever by which exterior power is applied to set the brakes, the end of the second lever being secured by a yielding attachment which yields when the force applied thereto attains a predetermined relation to the weight, whereby the exterior power transmitted to set the brakes is limited in its effect to a maximum determined by the weight of the car resting on the truck, substantially as described.

3. In a car-brake, the combination of the car, the truck, and the brake-beams with a series of connected brake-levers which transmit exterior power applied to set the brakes from one to another, and thus divide and equalize it, as described, and means whereby the last lever of the series is held to its work by the weight of the car resting on the truck, but permitted to yield when the force applied to it attains a predetermined relation to such weight, whereby the exterior power transmitted to set the brakes is limited in its effect to a maximum determined by the weight of the car, substantially as described.



4. In a car-brake, the combination of the car, the truck, the brake-beams, and the brake-levers with a bell-crank lever having its short arm arranged to pry the car and truck apart and its long arm actuated by the brake mechanism through which exterior power is transmitted to set the brakes, and whereby the car-wheels are relieved from excessive pressure by the yielding of the car, substantially as described.

5. In a car-brake, the combination of the car, the truck, the brake-beams, and the brake-levers with a cam-lever arranged between the car and truck-bolster and when operated in the act of setting the brakes tending to force them apart by its cam-power and its lever-power, and thereby to relieve the car-wheels from excessive brake-pressure, substantially as described.

6. In a car-brake, the combination of the following elements, viz: a metal plate or casting attached to the under side of the car-bolster, a metal plate or casting attached to the upper side of the truck-bolster directly beneath the plate or casting first mentioned and having a recess formed therein to accommodate the end of the lifting-lever, and a lifting-lever having its short arm retained in said recess and lying between said plates, so as to pry them apart and lift the car to relieve the car-wheels from excessive brake-pressure, substantially as described.

7. In a car-brake, the combination of the truck and brake-levers which transmit exterior power to set the brakes, with an additional lever which affords by its connection a fulcrum in the system of brake-levers and is itself so fulcrumed as to tend to lift the car, whereby the system of brake-levers transmits and applies the braking-power and the additional lever limits the maximum of power applied in proportion to the weight of the car, substantially as described.

414,109. STEAM-HAMMER FOR FORGING STEEL WHEELS. JAMES A. FAGER, Philadelphia, Pa. Filed May 8, 1889. Serial No. 310,086. (No model.)

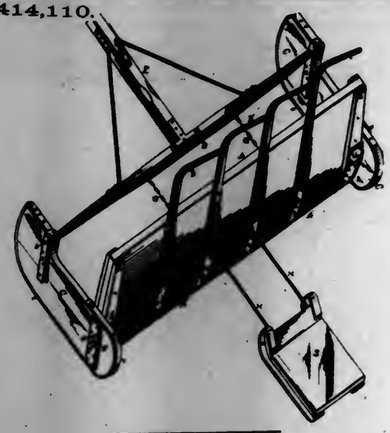
Claim.—1. In a steam-hammer for forging wheels, the combination of the hammer-die and anvil-die having recessed surfaces corresponding to the shape of the sides of the finished wheel, a projection upon one side of said hammer-die, and supporting devices to support the blank in an upright position against the vertical face of the anvil-die and under the projection on the hammer-die, substantially as and for the purpose specified.

2. In a steam-hammer for forging wheels, the combination of a hammer and an anvil die having their surfaces formed to correspond to the shape of the finished wheel when the dies are in contact, a projection carried by said hammer-die, and supporting devices to support the blank in an upright position under said projection.

3. Dies for forging steel wheels, consisting of the combination of an anvil-die having a large depression or recessed portion upon its face adapted to receive the entire wheel-blank, including the flange, in combination with a hammer-die formed with a small depression upon its face corresponding only to the side of the wheel and corresponding with the recessed portion in the anvil-die to shape the blank into a finished wheel, and provided on its front part with a projecting hammer part arranged above the support on the anvil-die and shaped to correspond to the tread and flange of the wheel.

4. Dies for forging steel wheels, consisting of the combination of an anvil-die having a large depression or recessed portion upon its face adapted to receive the entire wheel-blank, including the flange, and a support in front and at a lower level than its face and formed to correspond to the tread of the wheel, including a groove for the flange, and also with a lateral support for the wheel when resting upon the front supports, and removable pin or part detachably connected with the anvil-die opposite to the lateral support to hold the wheel-blank in position while being turned, in combination with a hammer-die formed with a small depression upon its face corresponding only to the side of the wheel and corresponding with the recessed portion in the anvil-die to shape the blank into a finished wheel.

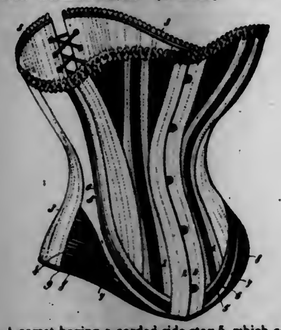
414,110. SNOW-SCRAPER. ELIAS GAYER, Connaeie, N. Y. Filed Apr. 3, 1889. Serial No. 305,652. (No model.)



Claim.—1. The combination, in a snow-scraper, with the scraper A, having handles B B' and pivot-bolts *a a*, of the sled-runners C C, having vertical slots *f''*, pole D, secured to the top front end of the runners C C, tongue E, and connecting-chains G G, all constructed and arranged to operate substantially as described, for the purposes specified.

2. In a snow-scraper, the combination, with the scraper A, having the pivot-bolts *a a* at its lower front ends, of the runners C C, having irons *c*, and straps *e* and *f'*, the strap *f'* having a slot *f''*, pole D, and tongue E, substantially as and for the purposes described and shown.

3. In a snow-scraper, the combination, with the scraper A, pivoted to the runners C C, and having handles B B', of the sled S, attached to the rear of the scraper A by rods H, as described, for the purposes specified.

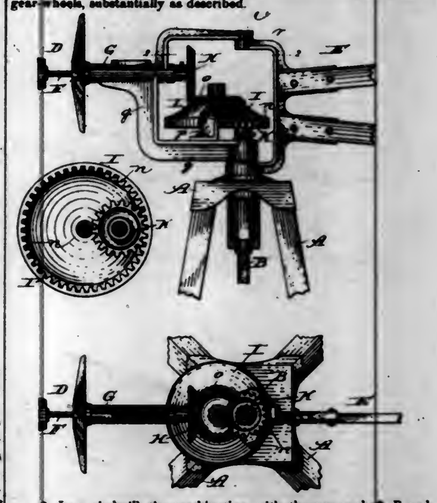


414,110.

414,111. IMPREGNATING WOOD, &c., WITH COPPER. ANDREW J. GOODWIN, New Smyrna, Fla. Filed Aug. 12, 1889. Serial No. 320,523. (No specimens.)

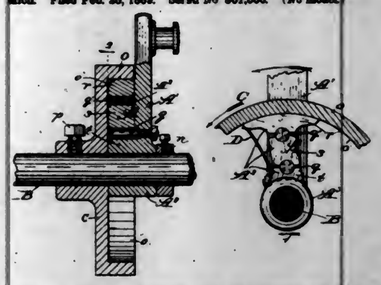
Claim.—In the preservation of wood or other substances by means of the mineral known as "copper," the process of depositing the copper in them by the action of grape-sugar or glucose, which consists in supplying the copper with suitable auxiliary elements in solution, as specified, then by passing said solution through their pores and interstices, and subsequently bringing in contact therewith a solution of grape-sugar or glucose in the proportions specified, all substantially as described.

414,112. CORSET. JOSEPH H. HAVILAND, Woodsport, N. Y., assignor to the Woodsport Skirt and Dress Company, same place. Filed June 29, 1889. Serial No. 316,088. (No model.)



Claim.—A corset, having a corded side stay 5, which commences at the top, passes in an approximately vertical line down to the hip, and then curves downward and forward to the inner edge of the front clasp, said stay having the convex rear edge 7 to its downward and forward curved part joined to the concave front edge of a gore-piece 8, formed of a single piece, having filling-cords extending continuously across the same substantially at right angles to its vertical rear edge, which is attached to the vertical edge 4 of the rear corset-section to perfect the outline of the lower edge of the corset, substantially as described.

414,113. WINDMILL. JOHN T. HOSTLER, Kalamazoo, Mich. Filed Feb. 25, 1889. Serial No. 301,005. (No model.)



Claim.—1. In a windmill, the combination, with the power-shaft B, having a gear-wheel near its upper end, and the revoluble support carrying the vane and the wind-wheel with its gear-wheel, of suitable horizontally-disposed gearing on the said revoluble support and interposed between and in mesh with the said gear-wheels, the vertical centers of the said interposed gearing and gear-wheel on the power-shaft being on perpendicular lines parallel to each other and both being revoluble in the same direction, substantially as described.

2. In a windmill, the combination, with the power-shaft B and a revoluble frame C, supporting the vane and wind-wheel, of a gear-wheel on the shaft B, a gear-wheel on the wind-wheel shaft, and a hollow gear-wheel I, supported on the frame C and extending over the gear on the power-shaft and provided externally and internally with gear-teeth respectively in mesh with the wind-wheel and power-shaft gear-wheels, substantially as described.

3. In a windmill, the combination, with the power-shaft B and the revolable frame C, supporting the vane and wind-wheel, of a gear-wheel K on the shaft B, a beveled gear-wheel H on the wind-wheel shaft, a hollow gear wheel I, supported on the frame C and extending over the wheel K, beveled teeth o around the narrower exterior surface of the wheel I, in mesh with the wheel H, and teeth n around its wider interior surface, in mesh with the wheel K, the whole being constructed and arranged to operate substantially as described.

414,114. INTERMITTENT GRIP. JOHN T. HOSTLER, Kalamazoo, Mich. Filed Feb. 25, 1889. Serial No. 301,006. (No model.)

Claim.—1. In an intermittent grip, the combination of a shaft, a lever fulcrumed on the shaft and having a rigid arm A', provided with a sleeve portion A^3, and a jointed arm A^2, extending out of direct radial line from the shaft, comprising an inner section t integral with the sleeve A^3, a shoe r, and an intermediate block s, hinged at opposite extremities to the section t and shoe, and a wheel C, supported to encircle the jointed arm, whereby the oscillation of the rigid arm causes the shoe to engage the inner periphery of the wheel intermittently and rotate it in one direction, substantially as described.

2. In an intermittent grip, the combination of a shaft, a lever fulcrumed on the shaft and having a rigid arm A', provided with a sleeve portion A^3, and a jointed arm A^2, extending out of direct radial line from the shaft, comprising an inner section t integral with the sleeve A^3, a shoe r, and an intermediate block s, hinged at opposite extremities to the section t and shoe, and a spring-finger D, rigid with the arm A' and projecting normally into contact with the shoe on the side of the latter toward which the arm A^2 inclines, and a wheel C, supported to encircle the jointed arm, whereby the oscillation of the rigid arm causes the shoe to engage the inner periphery of the wheel intermittently and rotate it in one direction, substantially as set forth.

3. In an intermittent grip, the combination of a shaft B, a lever A, fulcrumed on the shaft and having a rigid arm A' and a jointed arm A^2, carrying a shoe r and extending out of direct radial line from the shaft, a wheel C, supported to encircle the jointed arm, and shifting mechanism for retracting and advancing the shoe with relation to the inner periphery of the wheel, whereby the arm A^2 may be inclined at will to the opposite side of the radius, substantially as and for the purpose set forth.

4. In an intermittent grip, the combination of a shaft B, a lever A, fulcrumed on the shaft and having a rigid arm A' and a jointed arm A^2, a wheel C, supported to encircle the jointed arm, and a sleeve E, surrounding the shaft eccentrically and confined between the said shaft and lever, whereby, by turning the eccentric-sleeve upon the shaft independently of the lever A, the jointed arm may be adjusted into and out of frictional contact with the inner surface of the wheel, substantially as and for the purpose set forth.

5. In an intermittent grip, the combination of a shaft B, a lever A, fulcrumed on the shaft and having a rigid arm A' and a jointed arm A^2, a wheel C, supported to encircle the jointed arm, a sleeve E, surrounding the shaft eccentrically and confined between the said shaft and lever, a handle E', connected with the eccentric-sleeve and projecting normally longitudinally of the arm A', and a holder m upon the arm A', to secure the handle in its normal position, whereby, by swinging the handle to turn the eccentric-sleeve upon the shaft independently of the lever A, the jointed arm may be adjusted into and out of frictional contact with the inner surface of the wheel, substantially as and for the purpose set forth.

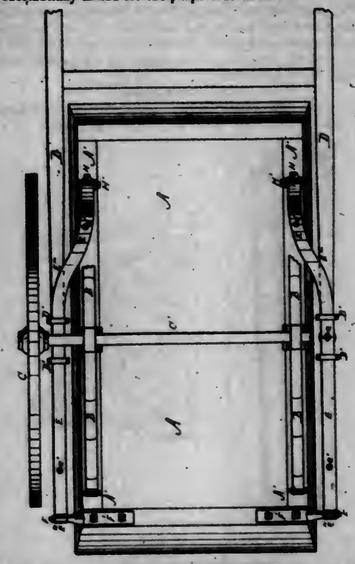
6. In an intermittent grip, the combination of a shaft B, a lever A, fulcrumed on the shaft and having a rigid arm A' and a jointed arm A^2, a wheel C, supported to encircle the jointed arm, a sleeve E, surrounding the shaft eccentrically and confined between the said shaft and lever, a handle E', connected with the eccentric-sleeve and projecting normally longitudinally of the arm A', and a holder m upon the arm A', to secure the handle in its normal position and laterally adjustable thereon to change the normal position of the handle, whereby, by swinging the handle to turn the eccentric-sleeve upon the shaft independently of the lever A, the jointed arm may be adjusted into and out of frictional contact with the inner surface of the wheel, and by adjusting the holder m the said frictional contact may be increased or diminished, substantially as and for the purpose set forth.

414,115. SANDPAPERING-ROLLER. JOSEPH S. KENYON, South Bend, Ind. Filed Jan. 17, 1889. Serial No. 296,612. (No model.)

Claim.—1. The combination of the cylinder and spring-controlled gripper at one end thereof with the continuous abrading-strip secured to one end of the cylinder, wrapped loosely and spirally around the same, and having its opposite end attached to said gripper, substantially as and for the purpose described.

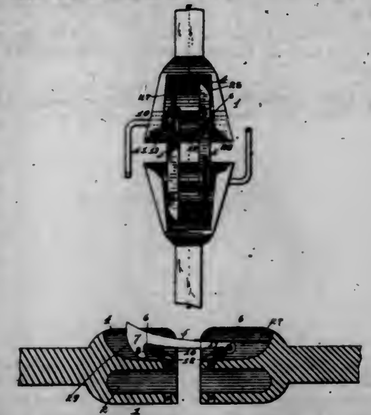
2. The combination of the cylinder having a fixed clamp in one end and a spring carrying a gripper in its opposite end with an abrading-strip secured at one end to the fixed clamp, wrapped spirally around the cylinder, and secured by its other end to the gripper, substantially as set forth.

3. The combination of the cylinder and the convolute spring in one end thereof with a jointed gripper connected to said spring and an abrading-strip connected to the cylinder at one end, wrapped spirally around the same, and connected at its other end to said gripper, all substantially as and for the purpose specified.



414,116. COMPOSITION FUEL. ADOLPH MAYER, Chicago, Ill. Filed Apr. 6, 1889. Serial No. 306,355. (No specimens.)

Claim.—As a new article of manufacture, a lump or block fuel composed of coal or coke screenings, flour, gum, and lard or other oleaginous substance, in the proportions substantially as described.



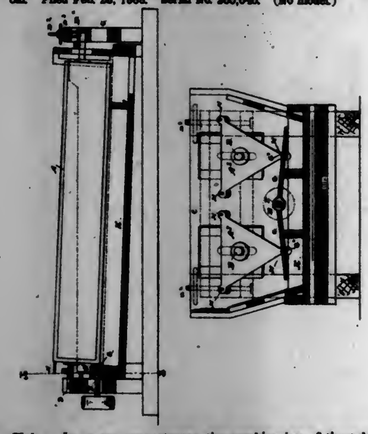
414,117. TWO-WHEELED VEHICLE. JAMES NEAL and CHARLES F. BOLLES, Amesbury, Mass. Filed July 3, 1889. Serial No. 316,451. (No model.)

Claim.—1. In a two-wheeled carriage, the combination, with the shafts D and carriage-body A, of the shaft-springs E, secured to said shafts at about the centers of the springs over the axle, and secured at their ends to the carriage near the forward and rear ends of the same, said springs being bent inward at E'' to avoid the shafts, substantially as and for the purpose set forth.

2. The combination, with the shafts D and carriage-body, of the shaft-springs E, secured to the shafts at D', attached at their rear ends to the carriage-body by bolts F, and plates F', bent inward at E'', and secured at their front ends to the carriage-body by joints H' and plates H, substantially as and for the purpose described.

414,118. CAR-COUPLING. HENRY NIEMANN, Denver, Colo., assignor of one-half to Frederick L. Rohling, same place. Filed Jan. 31, 1889. Serial No. 298,967. (No model.)

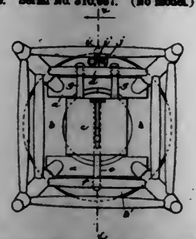
Claim.—1. The combination of a coupling-head or draw-bar having an open-topped recess 4 above the ordinary link-recess, a coupling-bar having a beveled and undercut hook end and independently pivoted in the upper recess, a lesser cam taking beneath such bar, a larger cam adapted to take beneath the coacting coupling-bar of the adjacent coupler, a pintle or shaft upon which such cams are secured pivoted in the walls of the upper recess and beneath the line of pivoting of the coupling-bar, and means, substantially as described, for lifting the cams to simultaneously disengage both coupling-bars, substantially as set forth.



2. The combination of a coupling-head having top recess 4, the coupling-bar 5, having the top beveled and undercut hook-head 7, the pin 6, the pintle 10, having crank-arm 11, the cam-surfaces 12 13, secured thereto, and the cords or chains 14 15, substantially as set forth.

3. The combination of coupling-head 1, the coupling-bar 5, having

the top beveled and undercut hook end 7, the pin 6, the pintle 10, having projecting crank-arm 11, the cams 12 13, secured upon each pintle, the cords or chains 14 15, and levers 20 21, substantially as set forth.

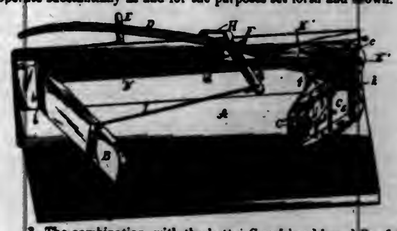


4. The combination of coupling-head 1, coupling-bar 5, pivoted in a recess therein and having the undercut hook end 7, with side bevel 26, spring 27, pin 6, pintle 10, with projecting crank-arm 11, cam-surfaces 12 13, secured upon the pintle, and the cords or chains 14 15, substantially as set forth.

414,119. ORE-CONCENTRATOR. ALMARIN B. PAUL, San Francisco, Cal. Filed Feb. 23, 1888. Serial No. 265,040. (No model.)

Claim.—In an ore-concentrator, the combination of the table A, triangular in cross-section and having the plane surfaces A' A', provided with ledges, as shown, and having also the journals B B, the stationary frame C, the journal-boxes D and $D^{\times}$ in said frame for receiving said journals, and the mechanism for imparting oscillating motion to the table, consisting of rotating shaft E, having an eccentric F thereon, the connecting-rod G, attached to one of the heads of the table, and the trough K, arranged beneath the table, substantially as described.

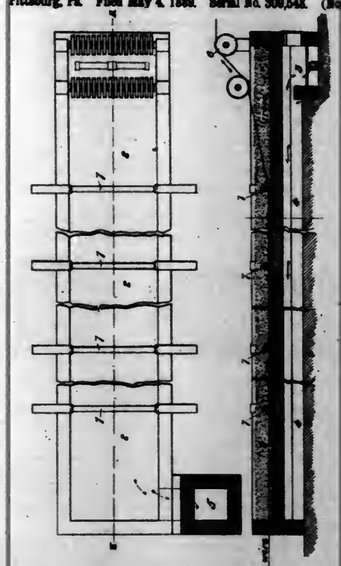
414,120. BABY-WALKER. ADOLPH PETERSEN, Brooklyn, N. Y. Filed May 13, 1889. Serial No. 310,667. (No model.)



Claim.—1. The combination, with the baby-walker stool having the centrally-open and opening and closing table-top, of the seat below having support at one side on a pivotal rung of the stool and at the other side by the slide-bolt of the seat detachably connecting with the opposite rung, substantially as described.

2. The combination, with the baby-walker stool having the centrally-open and opening and closing table-top, of the seat below having support at one side on and sliding connection with a pivotal rung of the stool and at the other side by the slide-bolt of the seat detachably connecting with the opposite rung, said bolt also having detachable connection with the stool-rung below the pivot-rung to secure the seat in the position of disuse, substantially as described.

414,121. ATTACHMENT FOR HARVESTERS. AMOS J. PECK, Butler, Ind. Filed Oct. 23, 1888. Serial No. 288,743. (No model.)

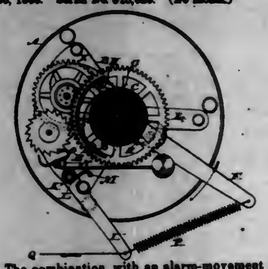


Claim.—1. The combination, in a grain-adjuster, with the head-board B and butter C, of the operating-bar D, pivotally connected at *d* to the butter and having a slot *d* therein, guide E, support H, bar G, pivoted at *g* to the support H, and passing through the slot *d* of the bar D, whereby the movement of the said bar D is communicated to the bar G, and link I, pivotally connected to the head-board B, as described, for the purposes specified.

2. The combination, with the adjusting-bar D, having a direct pivotal connection with the top of the butter, and shield K', also secured to the top of the butter, of said butter C, composed of the curved top bar 1 and bottom bar 2, rods 3 4, face-plate C', with teeth *t*, rod *o*, shaft *e*, bar *l*, and bracket *m*, all constructed and adapted to operate substantially as and for the purposes set forth and shown.

3. The combination, with the butter C and head-board B, of the shield made in two parts K and K', the part K fixed upon a stationary part of the frame, and the part K' secured to and movable with the butter C, as described, for the purposes specified.

414,122. PROCESS OF ANNEALING WIRE. HENRY ROSENTH, Pittsburg, Pa. Filed May 4, 1889. Serial No. 309,542. (No model.)

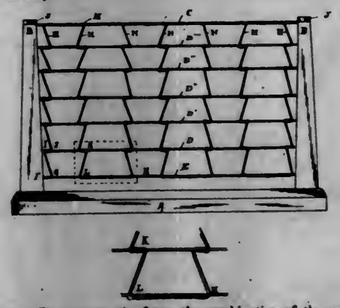


Claim.—An improvement in the art of annealing wire, which consists in passing the wire through a heated body containing small lumps or pieces of abrasive material—such as gravel—whereby the wire is simultaneously annealed and polished, substantially as and for the purposes described.

414,123. CALL-BELL. ALBERT F. ROCKWELL, Bristol, Conn., assignor to the New Departure Bell Company, same place. Filed May 20, 1889. Serial No. 312,372. (No model.)

Claim.—A call-bell composed of ordinary metallic call-bell mechanism, having combined with it, so as to cover it from view, a standard, a cap or canopy, and an operating thumb-piece, each of vegetable ivory, celluloid, hard rubber, or similar substance adapted to be made and kept ornamental, substantially as set forth.

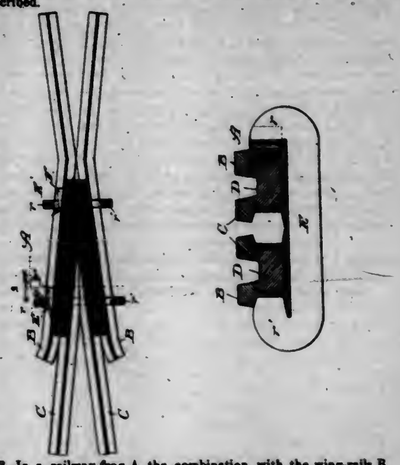
414,124. DOOR OR ALARM BELL. ALBERT F. ROCKWELL, Bristol, Conn., assignor to the New Departure Bell Company, same place. Filed June 26, 1889. Serial No. 315,020. (No model.)



Claim.—1. The combination, with an alarm-movement provided with a mainspring for operating it, of a stop for normally engaging with the movement and preventing its operation, mechanism for moving the stop, releasing the alarm-movement, and ringing the bell by the pull of the bell-wire, and mechanism having a yielding connection with the stop-releasing mechanism for winding up the mainspring by the pull that releases the alarm-movement, whereby the bell is caused to ring ordinarily as long as the pull upon the bell-wire is continued and is silenced by the discontinuance of the pull, like an electric bell, substantially as set forth.

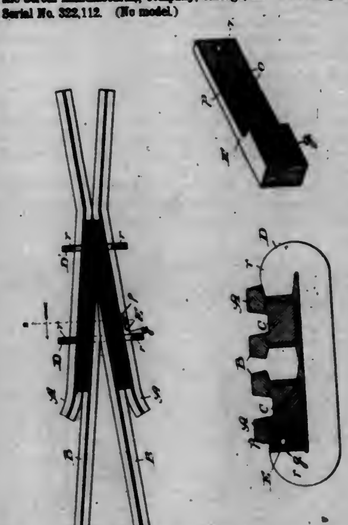
2. The combination, with the alarm-movement provided with its mainspring, of the levers F and I, connected together at their free ends by a spring, the pawl and ratchet operated by the lever F to wind up the mainspring, and the pivot-post K, its spring L, and the arm N, arranged substantially as and for the purpose set forth.

3. The combination, with an alarm-movement having a mainspring for operating it, of a stop for normally engaging with the movement and preventing its operation, the lever F, operatively connected with the mainspring-arbor, so as to turn it and wind the mainspring, the lever I, connected with the stop, so as to move it and release the alarm mechanism, and a yielding connection between the free ends of the levers, whereby the lever I may be operated without operating the lever F when the mainspring becomes fully wound, substantially as set forth.



414,125. WIRE FENCE. PETER SOMMER, JOHN SOMMER, and PETER W. SOMMER, Dilon, Ill. Filed June 7, 1889. Serial No. 313,422. (No model.)

Claim.—In a woven-wire fence, the combination of the continuous cable C, the horizontally-parallel frame-wires D D' D'' D''' D'''' E, forming the frame-work on which the keystone meshes composing the netting are woven, the continuous wire H, twisted with the frame-wires at the intersecting points into short cables, by means of which the said meshes are firmly retained in their original shape, all substantially as hereinbefore described.



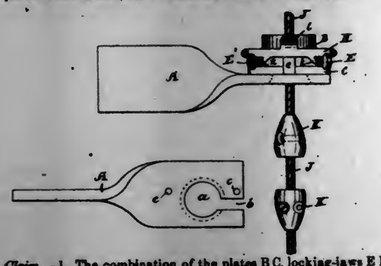
414,126. RAILWAY-FROG. AXEL A. STROM, Austin, assignor to the Strom Manufacturing Company, Chicago, Ill. Filed Aug. 22, 1888. Serial No. 321,630. (No model.)

Claim.—1. In a railway-frog A, the combination, with the wing-rails B and point-rails C, braced intermediately by filling D or the like, of clamps E and E', each comprising a metal bar having its ends turned edgewise of the bar toward each other and affording the hook-shaped extremities *r* and *r'*, the said clamps embracing the frog across its base, respectively, near the ends of its wider and narrower portions, the keys F, driven directly between the extremities of the clamps and side of a wing-rail and bent at their protruding tapering ends toward the respectively adjacent sides of the clamps, substantially as described.

2. In a railway-frog A, the combination, with the wing-rails B and point-rails C, braced intermediately by filling D or the like, of clamps E and E', each comprising a metal bar having its ends turned edgewise of the bar toward each other and affording the hook-shaped extremities *r* and *r'*, the said clamps embracing the frog across its base, respectively, near the ends of its wider and narrower portions, the keys F split toward their tapering extremities and driven between the extremities of the clamps and side of a wing-rail, and each having the outer portion of its protruding split end bent toward the adjacent side of a clamp, substantially as described.

414,127. RAILWAY-FROG. AXEL A. STROM, Austin, assignor to the Strom Manufacturing Company, Chicago, Ill. Filed Aug. 27, 1889. Serial No. 322,112. (No model.)

Claim.—1. A railway-frog having its parts secured together by clamps D and D', embracing the frog across its base, with their hook ends bearing directly and solely against the outer sides of the wing-



rails, whereby the wedge shape of the frog alone serves for wedging the clamps in their operative positions, substantially as described.

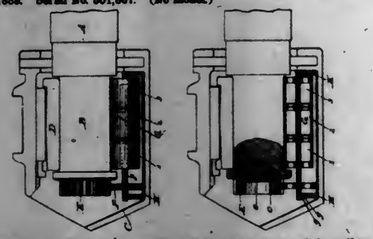
2. A railway-frog having its parts secured together by clamps D and D', embracing the frog across its base, with their hook ends bearing directly and solely against the outer sides of the wing-rails, whereby the wedge shape of the frog alone serves for wedging the clamps in their operative positions, and stops provided on the frog against the rear sides of the clamps, substantially as and for the purpose set forth.

3. A railway-frog having its parts secured together by clamps D and D', embracing the frog across its base, with their hook ends bearing directly and solely against the outer sides of the wing-rails, whereby the wedge shape of the frog alone serves for wedging the clamps in their operative positions, and stops adjustably secured to the wing-rails against the clamps, substantially as and for the purpose set forth.

4. A railway-frog having its parts secured together by clamps D and D', embracing the frog across its base, with their hook ends bearing directly and solely against the outer sides of the wing-rails, whereby the wedge shape of the frog alone serves for wedging the clamps in their operative positions, and adjustable stops E, each having a head *q* and perforated tail-piece *p*, through which it is bolted to the wing-rail against a clamp, substantially as and for the purpose set forth.

414,128. LOCKING DEVICE FOR ELEVATORS. CORNELIUS F. SULLIVAN, Boston, Mass., assignor of one-half to Frank W. Lowe, same place. Filed Feb. 15, 1889. Serial No. 299,993. (No model.)

Claim.—1. The combination of the plates B C, locking-jaws E E', springs G, and drop-latch H, having the jaw-holding ears, all constructed and arranged substantially as and for the purposes set forth.

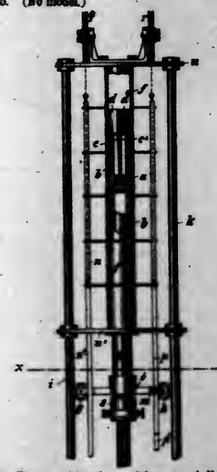


2. The plate B, having a circular hole a^2, slot *d*, and lug *e*, in combination with the plate C, having a circular hole a^2, slot *f*, and lug *g*, whereby the plates can be readily placed around the rope and then locked together, substantially as set forth.

3. The bracket A, consisting of a flat piece of metal bent or twisted so that its ends stand at right angles with each other, and one end having a circular hole *a* and slot *b*, in combination with plates B C, locking-jaws E E', springs G, and drop-latch H, having the holding-ears, substantially as and for the purposes described.

4. Two locking-jaws pivoted and held together at their rear end by lugs in one of which is a slot and in the other a pin fitting in said slot, so that when either jaw is operated the two jaws move simultaneously, but in opposite directions, in combination with plates B C, drop-latch H, having the jaw-holding ears, and springs G, substantially as shown and described.

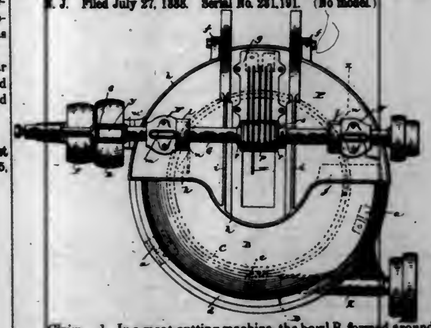
5. The combination, with the shifting-rope of an elevator-car provided with stops K, of the locking-jaws, springs G, plates B C, and drop-latch H, having the jaw-holding ears, substantially as shown and described.



414,129. CAR-AXLE LUBRICATOR. HENRY VAN DEGAR, East Albany, assignor of one-half to Aaron Fryer, Bath, N. Y. Filed Mar. 5, 1889. Serial No. 301,867. (No model.)

Claim.—1. The combination, with the journal end of the railway-axle provided with the central end perforation *a*, of the gear E, constructed as described, and provided with a central projection or stem *c*, corresponding in diameter and form with the central perforation and provision for holding the gear from turning in relation to the end of the journal, substantially as and for the purposes set forth.

2. The combination, with the journal end of the railroad-axle, of a lubricating-cylinder composed of two or more independent and separate sections which can at will be applied to a common shaft and revolved in contact with the lower side of the journal of the axle, gear E, secured to the end of the axle so as to revolve with the same, and gear F, secured to the shaft on which the several sections of the lubricating-cylinder are mounted, substantially as and for the purposes set forth.



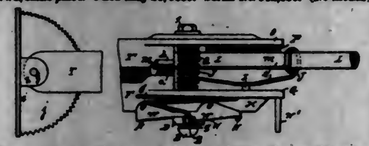
414,130. ARC LAMP. FRIEDRICH W. R. SEIFERT, Altona, assignor to Otto Lindemann, Hamburg, Germany. Filed June 27, 1888. Serial No. 315,725. (No model.)

Claim.—1. The combination, with a coaxially-arranged solenoid and the central diamagnetic tube, of the core pending in said tube and the two iron jaws connected to and projecting above the upper end thereof and bearing against said tube, as set forth.

2. The combination, with a coaxially-arranged solenoid and the central diamagnetic tube, of the core pending in said tube, the two semi-cylindrical or globular jaws in contact with said core, and the springs or articulated rods connected at their lower ends to said core and at their ends to said jaws, substantially as set forth.

414,131. MEAT-CUTTING MACHINE. PETER WILKIE, Trenton, N. J. Filed July 27, 1888. Serial No. 281,101. (No model.)

Claim.—1. In a meat-cutting machine, the bowl B, formed around its upper edge with a continuous depending bearing-flange and having the hinged lid or cover formed around its edges with a continuous raised flange and across its top with corresponding flanges, substantially as described.



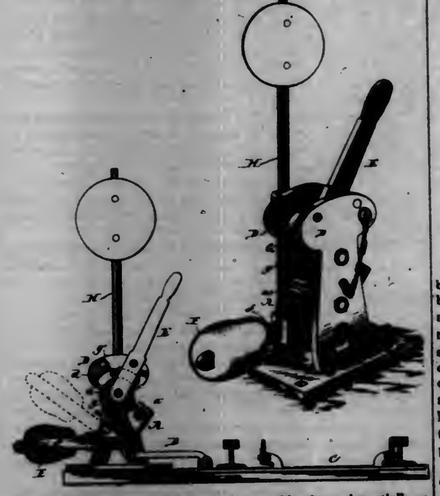
2. In a meat-cutting machine, the combination, with the supporting-frame formed around its upper edge with a continuous flange in which is formed a groove, of the bowl B, formed around its upper edge with a flange fitting in said groove and provided on its under side with a continuous surrounding worm-gear, said bowl being also provided with the hinged lid formed at one point of its front edge with the bevel indicated at *j*, substantially as described.

3. In a meat-cutting machine, the combination, with the supporting-frame, of the bowl B, having the hinged lid provided with the raised flanges and the inward slant *j*, and means for rotating said bowl, substantially as described.

4. In a meat-cutting machine, the hinged lid or cover formed around its edges with a continuous raised flange and having two corresponding flanges extending across the same, substantially as shown, and for the purpose described.

5. In a meat-cutting machine, the hinged lid having the raised flanges and formed at one point of its front edge with an inward slant or bevel, as indicated at *j*, substantially as described.

414,132. TELEPHONE-SUPPORTING DEVICE. SAMUEL J. ADAMS, Detroit, Mich., assignor of three-fourths to Jacob Brown and Arthur Brown, same place. Filed May 26, 1888. Serial No. 312,269. (No model.)



Claim.—1. In a telephone-supporting device, the combination, with two jaws adapted to clamp a movable supporting-rod between them, of a rotatable disk carrying thereon a cam adapted to press the jaws together, a movable lever adapted to engage with the disk in one direction, and a spring adapted to hold said lever normally in one position, substantially as shown and described.

2. In a telephone-supporting device, the combination, with two jaws adapted to clamp a supporting-rod between them, of a rotatable disk carrying thereon a cam adapted to press the jaws together, a movable lever adapted to engage with the disk in one direction, a spring adapted to hold said lever normally in one position, and a stop-pin secured to one of the jaws in the path of the lever, substantially as and for the purposes set forth.

3. The combination of the movable jaws C and G, the rod L, the pivoted support K, encircling said rod L at the end of said support, and the arc M, connected with said support and passing between the movable jaws, substantially as shown and described.

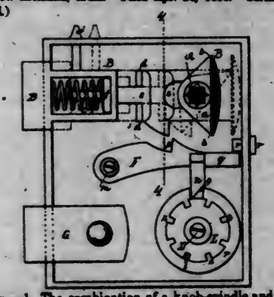
414,133. RAILWAY-SWITCH STAND. CHARLES ALKIRE, Muskegon, Mich., assignor to Henrietta Alkire, same place. Filed Sept. 24, 1888. Serial No. 286,261. (No model.)

Claim.—1. In a switch-stand, the combination, substantially as hereinbefore set forth, of a vibratory switch-lever pivoted upon a stationary bearing on the stand and arranged for connection with a switch, a hand-lever pivoted upon a stationary bearing on the switch-stand and hung separately from and operative independently of said switch-lever, and a temporary connecting device intermediate of said two levers and comprising a movable stop or abutment which is independent of the hand-lever and connected with the switch-lever, said movable stop being arranged with relation to the hand-lever so that the latter may, when swung in one direction only, engage and move said abutment, for the purpose described.

2. The combination, substantially as hereinbefore set forth, with a weighted switch-lever to connect with a switch, of a hand-lever, and an intermediate power-transmitting connection consisting of a lever engaging the switch-lever and pivoted to swing independently of the hand-lever when the latter is thrown to one side, for the purpose described.

3. The combination, with the switch-lever that is to connect with a switch, of the hand-lever E, and an intermediate power-transmitting connection consisting of the lever G, connected with the switch-lever and having an abutment with which the hand-lever can engage, substantially as and for the purpose described.

4. The combination, in a railway-switch stand, of a vibratory rocker or switch-lever A, a hand-lever hung to vibrate independently of said switch-lever, a temporary connection intermediate of said levers and consisting of a movable abutment arranged so that when the hand-lever is thrown to one side and locked the switch-lever may freely vibrate, and the vibratory weighted arm arranged to normally rest upon the switch-lever, but pivoted so that it can be lifted independently thereof, substantially as and for the purpose described.

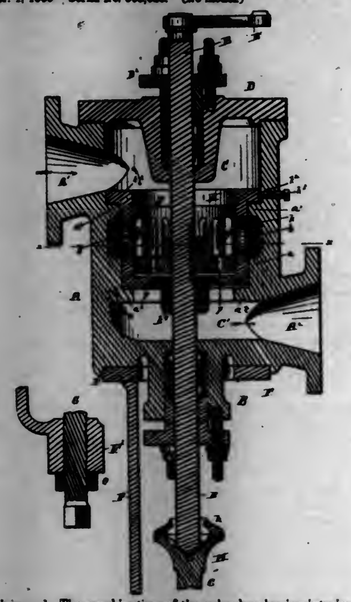


5. The combination, with the weighted switch-lever, which is connected with a switch, of the lever G, gear-connected with the switch-lever, the signal-rod H, connected with the lever G, and the hand-lever arranged for engagement with and disengagement from the lever G, substantially as described.

6. The combination, substantially as hereinbefore set forth, of the vibratory rocker or switch-lever A, pivoted between the upright side plates D of a switch-stand, the vibratory weighted arm arranged to normally rest upon said switch-lever, but pivoted to allow it to be lifted independently of the same, and a short vibratory lever G, which is confined between the side plates of the switch-stand and gear-connected with the rocker or switch-lever A, for the purpose described.

414,134. PROCESS OF REFINING IRON. GEORGE ARCHBOLD, New York, N. Y., assignor to Hiram Gilbert Bond, same place. Filed Sept. 20, 1888. Serial No. 284,564. (No specimens.)

Claim.—The method, substantially as herein described, of eliminating the phosphorus or phosphorus and sulphur from iron, which consists in treating it in the presence of the cyanide of barium.



414,135. PERMUTATION-LOCK. OLE S. BAKKE and OLE HALGRIMSEN, New Richland, Minn. Filed Apr. 20, 1888. Serial No. 271,208. (Model.)

Claim.—1. The combination of a knob-spindle and divided lock-bolt adapted to be operated thereby, the inner section of said lock-bolt embracing said knob-spindle and adapted to slide thereon by means of a slot *c* formed in said inner section, a rectangular longitudinal groove formed in the rear face of said inner section, adapted to slide upon a similarly-shaped leg formed upon the back of the lock-case, lugs *d d* on the outer end of said inner section, a T-shaped arm extending from the inner end of the outer section of the lock-bolt and adapted to be received between and behind said legs, a latch-lever for locking said inner section of the lock-bolt, and a series of tumblers for operating said latch-lever, substantially as and for the purpose herein specified.

2. The combination, with a knob-spindle carrying cam *a* and divided lock-bolt adapted to be operated thereby, of a latch-lever adapted to engage with and lock the inner section of said divided lock-bolt, a series of tumblers for operating said latch-lever, an arm *q* on said latch-lever, and a movable stop *r*, for retaining said latch-lever when engaged by said tumblers substantially as and for the purpose herein specified.

414,186. VALVE. VIRGIL W. BLANCHARD, New York, N. Y. Filed Apr. 1, 1889. Serial No. 305,633. (No model.)

Claim.—1. The combination of the valve-box having interior upper and lower flanges $a' a^2$, substantially as described, and a removable cup-shaped valve-seat having a rim b^2, and supported therein upon said flanges and laterally perforated, with a cup-shaped valve laterally perforated and fitted to said seat, and the vertically-adjustable valve-stem carrying said valve, all substantially as set forth.

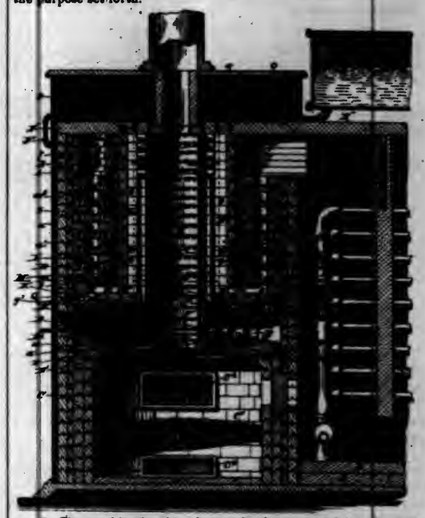
2. The combination of a valve-box having ribs and flanges a a' a^2, vertical passages b, and a fixed laterally-perforated valve-seat supported on flanges a' a^2, with a laterally and vertically perforated oscillating valve, substantially as described.

3. The combination of a valve-box having chambers C C' communicating with inlet and outlet ports, an annular series of vertical passages b between said chambers, and a laterally-perforated valve-seat to the inside of said passages, with a vertically-adjustable laterally-perforated oscillating valve fitted in said seat, substantially as described.

4. A valve-box having an inlet leading into a chamber C and an outlet leading from a chamber C', vertical ribs, horizontal flanges, and stuffing-boxes in its heads, in combination with a fixed laterally-perforated valve-seat flanged and cup-shaped, as described, the vertically and laterally perforated oscillating valve, also cup-shaped, and a vertically-adjustable valve-stem, to which said valve is secured, all constructed substantially as and for the purpose specified.

414,187. FURNACE. VIRGIL W. BLANCHARD, New York, N. Y. Filed June 21, 1889. Serial No. 315,073. (No model.)

Claim.—1. The combination, in a furnace, of the ash-pit, a dome above the same, a water-containing vessel in said dome, incased with fire-brick and non-conducting material, and the water-circulating pipes connected to said vessel, substantially as described.



2. The combination, in a furnace, of a water-holding vessel suspended above the fire-chamber thereof, a fire-brick dome below said vessel, and the fire-brick walls and mixing-chambers supported thereon, substantially as specified.

3. The combination, in a furnace, of the channeled and perforated fire-bricks I J, arranged above the fire-chamber thereof, and the water-circulating pipes passing through said fire-bricks, but not exposed to the fire, substantially as specified.

4. The combination of the fire-chamber, its fire-brick dome, a water-holding vessel above said dome, and the channeled and chambered fire-bricks above said vessel, with the pipes connected to said vessel and rising through said fire-bricks, as and for the purpose specified.

5. The combination, in a furnace, of a water-holding vessel suspended above the fire-chamber and the fire-brick suspended from said vessel, substantially as described.

6. The combination, in a furnace having a fire-chamber, a dome above said chamber, a central flue, perforated and channeled fire-bricks surrounding said flue, and descending flues exterior thereto, with a water-holding vessel in said dome protected by the fire-bricks thereof, and the water-pipes rising therefrom through said bricks, as and for the purpose set forth.

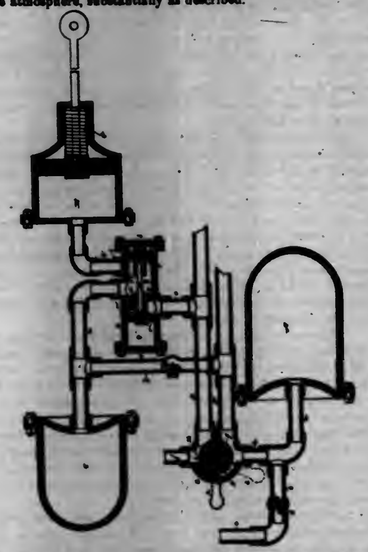
7. The combination, in a furnace having a central flue above the fire-chamber, and a wall of perforated and channeled fire-brick surrounding the same, the descending flues exterior thereto, and the fire-brick wall inclosing said descending flues, with a water-circulating coil exterior to said wall and its inclosing fire-brick, all substantially as set forth.

8. The combination, in a furnace having a central flue, perforated and channeled fire-brick walls surrounding the same, exterior descending flues, and a series of ascending mixing-chambers, with a water-circulating coil inclosed in fire-brick walls between the descending flues and mixing-chambers, and a water-circulating coil exterior to said chambers, substantially as set forth.

9. The combination of the furnace having a fire-brick dome, water-holding vessel above the same protected by fire-brick, and a series of channeled and chambered fire-bricks above said vessel, with a water-holding tank above said fire-brick, and the pipes extending through said bricks and communicating with the tanks and vessel, all substantially as described.

10. The combination, in a furnace, of a fire-brick dome, a water-holding vessel therein, an air-chamber above said vessel, and the ascending and descending flues, and the mixing-chambers, constructed and arranged substantially as and for the purpose set forth.

11. In a furnace, the combination of a series of bricks J, constructed substantially as described, with vertical openings and lateral channels and passages, with a series of vertical water-pipes passing through said bricks, as and for the purpose specified.



12. In a furnace, the combination of a series of bricks I, having vertical openings and lateral passages and channels, substantially as described, and the series of water-pipes passing through the vertical openings in said bricks, as and for the purpose set forth.

13. The combination, in a furnace, of the casing having an outer metal shell, an inner and outer fire-brick wall, and a water-circulating coil B between said walls, substantially as set forth.

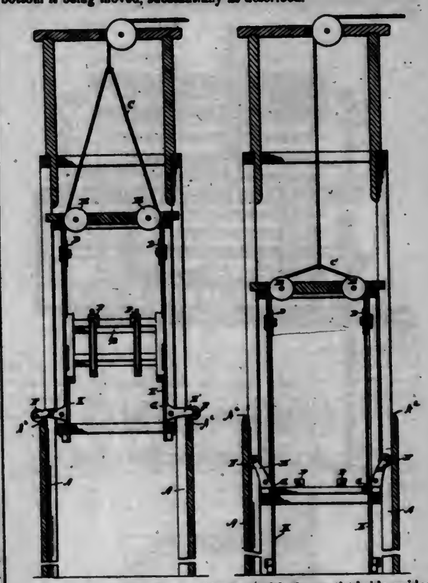
14. The combination, in a furnace, of a water-holding vessel suspended above the fire-chamber thereof with a series of fire-bricks suspended from and protecting said vessel, as and for the purpose set forth.

414,188. STRAIGHT-AIR AUTOMATIC BRAKE. ALBERT R. BOLTON, Norwood, Ohio, assignor of one-half to Harvey J. Ubert, New York, N. Y. Filed June 26, 1889. Serial No. 315,468. (No model.)

Claim.—1. A straight-air automatic brake comprising a main reservoir, two lines of pipes, an engineer's valve interposed between the main reservoir and the two lines of pipes and having a port to open communication between the main reservoir and one or both lines of pipes and another port to open communication between one line of pipe only and the atmosphere, an auxiliary reservoir, a triple valve comprising two pistons moving together and of unequal area and arranged in isolated chambers, the smaller piston and chamber communicating directly with one of the lines of pipes and the auxiliary reservoir and with the brake-cylinder, and the other chamber containing the larger piston communicating with the other line of pipe and the atmosphere, substantially as described.

2. A triple valve comprising a shell divided into two compartments isolated from one another and of unequal area and pistons of corresponding inequality as to area arranged in the said compartments or chambers and rigidly connected by a stem common to both, combined with two lines of pipes, both of which are adapted to be put into open communication with a main reservoir, and one of which is always in such communication, and is also open to the smaller chamber of the triple valve, and thence to the brake-cylinder to set the brakes, and the other of which opens into the larger chamber of the triple valve and may be opened to the main reservoir to release the brakes and then opened to the atmosphere to permit the escape of the air for permitting the setting of the brakes, substantially as described.

3. A straight-air automatic brake comprising a main reservoir, two lines of pipes, an engineer's valve interposed between the main reservoir and the two lines of pipes and having a port to open communication between the main reservoir and one or both lines of pipes, and another port to open communication between one line of pipe only and the atmosphere, an auxiliary reservoir, a check-valve interposed in a branch pipe connecting the auxiliary reservoir with the main line of pipe, a triple valve comprising two pistons moving together and of unequal area and arranged in isolated chambers, the smaller piston and chamber communicating directly with one of the lines of pipes and the auxiliary reservoir and with the brake-cylinder, and the other chamber containing the larger piston communicating with the other line of pipe and the atmosphere, substantially as described.



414,189. COAL-CAGE. RALPH R. CAMPBELL, Streator, Ill. Filed Dec. 18, 1888. Serial No. 294,011. (No model.)

Claim.—1. In a coal-hoist, the combination, with the cage having the movable false bottom and the hoisting-rope connected to said bottom, of the locking mechanism for retaining said bottom depressed while the cage is being raised or lowered, substantially as described.

2. In a coal-hoist, the combination, with the cage having the movable false bottom and the hoisting-rope connected to said bottom, of the dogs or catches engaging the side guides and projecting above the false bottom to retain the same depressed while being raised or lowered, substantially as described.

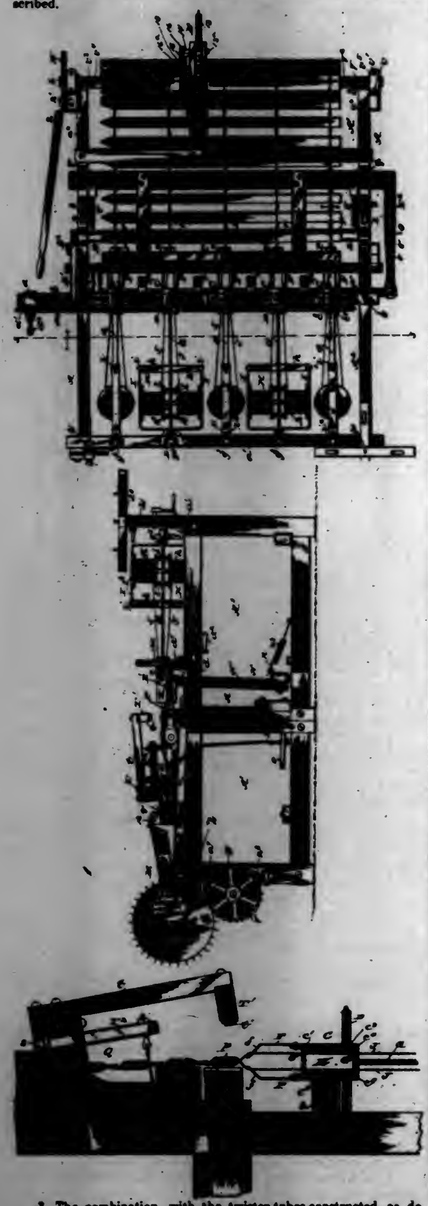
3. In a coal-hoist, the combination, with the cage having the movable false bottom and the hoisting-rope connected thereto, of the dogs or catches pivoted on the cage, one arm of each of said dogs engaging the side guides and the other projecting above the false bottom to retain the same depressed while being raised or lowered, substantially as described.

4. In a coal-hoist, the combination, with the side guides having the substantially horizontal bearings at the top, and the cage having the movable false bottom, of the dogs engaging the side guides and projecting above the false bottom to retain the same depressed while rising or lowering, and also engaging the substantially horizontal bearings at the top of the side guides to support the cage while the false bottom is being moved, substantially as described.

5. In a coal-hoist, the combination, with the vertical side guides having the substantially horizontal bearings at the top, the cage having the pivoted false bottom to which the hoisting-rope is connected, and bearings for the inner ends of the dogs at the side of said bottom, of the dogs pivoted on the cage, each dog having an arm projecting above the false bottom and another arm engaging the vertical side guides to retain the false bottom depressed while the cage is being raised or lowered, and also engaging the substantially horizontal bearings, and the side bearings on the false bottom to support the cage while the false bottom is being tilted, substantially as described.

6. In a coal-cage, the combination, with the vertically-movable false bottom and the locking mechanism to retain the bottom depressed while in the shaft, of the horizontal bearings at the top of the shaft, with which dogs on the cage engage to support the cage in elevated position, substantially as and for the purpose specified.

7. In a coal-cage, the combination, with the movable false bottom and the locking mechanism to retain the bottom depressed while in the shaft, of the horizontal bearings, with which dogs on the cage engage to retain the cage elevated, and the segments secured to the false bottom to keep the dog in engagement with the horizontal bearings while the false bottom is elevated, substantially as described.



8. In a coal-hoist, the combination, with the cage having the movable false bottom, of the downward extensions secured to said bottom at one side, and the pivots at the end of said extensions, below the top level of the supporting-timbers, whereby when the bottom is tilted the edge of the bottom will be projected beyond the pivotal point to dump the coal away from the shaft, substantially as described.

414,140. FENCE-MACHINE. ERNEST W. CRAMBELL, Waco, Tex., assignor of two-thirds to Jesse P. Hodge, same place. Filed Aug. 16, 1889. Serial No. 321,042. (No model.)

Claim.—1. In a fence-making machine, essentially as described, the combination, with the twister disks or tubes provided with extended hubs having radial notches, of the spool-holding frame detachably journaled at one end in the main frame, its opposite end provided with radial projections adapted to fit the radial notches in the said disk-hub, substantially as and for the purpose described.

2. In a fence-making machine, essentially as described, the combination, with the twisting devices consisting each of a hollow tube journaled to the main frame, provided at one end with a cross-bar having wire passages, spring-arms projecting forward from said tube, their inner ends bent toward each other and provided with wire passages, a drive-wheel secured upon said tube, the rear end of said tube

extended and provided with notches in its outer end, of the spool-supporting frame consisting of a main bar provided at its forward end with a disk having radial extensions fitting the notched end of the tube, the opposite end journaled in the main frame, and yokes secured to said main bar adapted to support the spools, and means for operating the twister devices and the spools, substantially as shown and described.

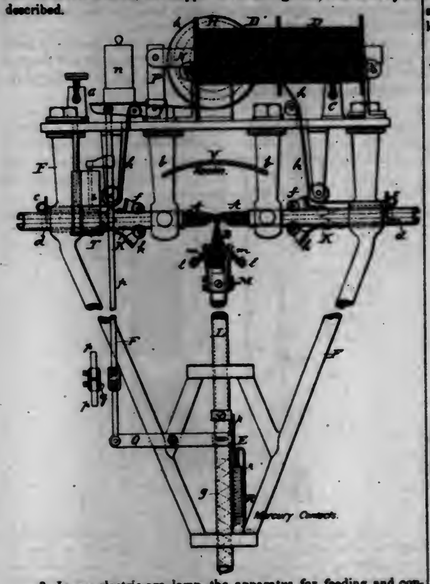
3. The combination, with the twister-tubes constructed as described, of the spool-supporting frames consisting of a main or supporting bar detachably connected at one end to the twister-tube to turn therewith, the opposite end journaled in the main frame, arms extending laterally in opposite directions from said supporting-bar, spring-arms hinged at one end to the outer ends of said lateral arms, their free ends adapted to engage locking-lugs on the supporting-bar, pintles formed on the inner faces of the supporting-bar and hinged arms, and the spools journaled on said pintles between said bar and arms, substantially as shown and described.

4. In a fence-making machine, essentially as described, the spool-supporting frame consisting of the main bar, the lateral fixed arms, and the hinged arms, said arms and bar provided with short pintles projecting inwardly, in combination with the spools provided with end recesses fitting on said pintles, and coiled or buffer springs secured between the disks and the supporting-bar, substantially as and for the purpose shown and described.

5. In a fence-making machine, essentially as described, the combination, with the wire feeding and twisting devices constructed substantially as shown and described, and the vertical picket-supporting posts arranged in front of the twisting-tubes, of a pusher-frame consisting of a transverse bar adjustably pivoted to the lower timbers of the main frame, vertical arms secured to said bar and extended upward between the twister-tubes, the upper ends of said arms provided with L-shaped picket-rests, a spring for normally holding said vertical arms between the twister-tubes, and a foot-lever connected to the said transverse bar of the pusher-frame, said pusher-frame adapted to force the picket onto the picket-supporting posts when the lever is depressed, as and for the purpose described.

6. The combination, with the wire feeding and twisting tubes, essentially as described, and the picket-supporting posts arranged in front of said tubes, of a pusher-frame pivoted at its lower end to the main frame, the upper end disposed between the twister-tubes, a foot-lever connected to said pusher-frame, a hammer-frame pivoted at its front end to the main frame, its forward end disposed over the picket-supporting posts, a connection between said hammer-frame and the aforesaid foot-lever, and means for normally holding the hammer-frame elevated above said picket-posts, said pusher-frame and hammer-frame operated simultaneously by a single movement of the foot-lever, substantially as shown and described.

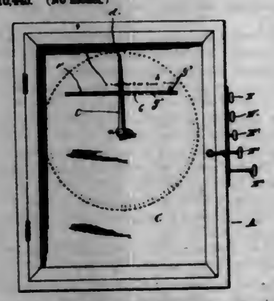
7. The combination, with the wire-feeding and wire-twisting devices and the picket-supporting posts, of a hammering device consisting of a transverse bar adjustably journaled to the frame of the machine to or from the picket-supporting posts, rearwardly-projecting arms, and a transverse hammer-bar secured to the outer ends of said arms, provided with a metal-hammering face or faces, said hammer-bar disposed normally above the picket-supporting posts, a spring for holding it in such position, and means for operating said hammering device, substantially as shown and described.



8. In a fence-making machine, essentially as described, the combination, with the winding-shaft V, detachably journaled in the main frame, as shown, and provided with a projecting bolt v^4, of the bar V^3, provided with a notch v^2 at one end engaging the bolt v^4, its opposite end bolted to the shaft, as at v^3, substantially as and for the purpose described.

9. In a fence-making machine, essentially as described, a registering device consisting of an arm or frame hinged to the main frame and projected over the finished fence-section, a wheel journaled in the outer end of said arm, provided with a series of radial teeth engaging the moving pickets, whereby said wheel is revolved, the shaft of said wheel provided with a lateral projection, a toothed disk formed on one face of a dial-wheel loosely mounted on a fixed shaft, said tooth-wheel adapted to be turned by the said lateral projection, and a pointer-arm secured on the outer end of said fixed shaft and projected over the dial-face, substantially as and for the purpose described.

414,141. ARC LAMP. FREDERIC G. CHAPMAN and FRED M. DEARDEN, London, England, assignors of one-third to William George Chapman, same place. Filed Sept. 27, 1888. Serial No. 286,497. (No model.) Patented in England May 13, 1887, No. 7,042; in France Mar. 13, 1888, No. 189,332; in Belgium Mar. 13, 1888, No. 81,012, and in Germany Apr. 4, 1888, No. 46,725.

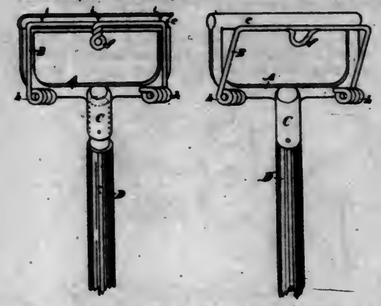


Claim.—1. In combination with a vertical negative carbon, its guide and feeding and adjusting devices, a two-part positive carbon provided with notches in its outer ends, tubular horizontal guides for the same, each provided near the arc position with a pair of contact-rollers, one of which is spring-pressed, plugs working in said guides having wedge-shaped ends fitted to said notches, a feed-drum and connections, and conducting-supports for said guides, substantially as described.

2. In combination with a vertical negative carbon, its guide and feeding and adjusting devices, the two-part cylindrical positive carbon having a skin-preventing groove along its top and provided with notches in its outer ends, and tubular horizontal guides for the same extending laterally from points near the arc position, plugs working in said guides having wedge-shaped ends fitted to said notches, a feed-drum and connections, and supports for said guides, substantially as described.

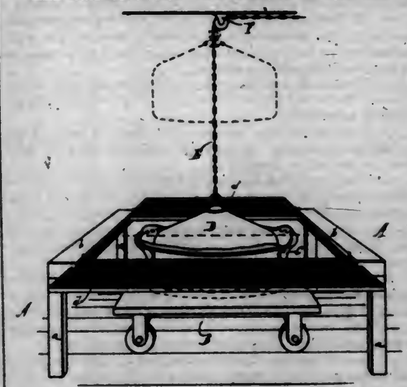
3. In an electric-arc lamp, the apparatus for feeding and controlling the negative pole, consisting of guide-tube L, adjustable retaining device M *m m*, mercury contacts E, and feed-spring *g*, the whole tube operated for adjustment by the solenoid D D′ and connections, substantially as described.

414,142. DEVICE FOR COUNTING STAMPS. WARREN A. CROCKETT and JUDSON N. HATCHER, Americus, Mo. Filed May 11, 1889. Serial No. 310,445. (No model.)



Claim.—1. The combination, with the graduated or numbered plate or dial, having the slide provided with a pin or projection and an index or pointer, of the pointer or index carried by a ratchet or tooth-wheel and having upon one side a shoulder engaging said pin or projection and a series of keys of proportionately increased or graduated lengths, a lever acted upon by said keys, and a pawl engaging said ratchet or tooth-wheel, substantially as set forth.

2. The combination, with the graduation or numbered plate or dial having the slide provided with a series of pins or projections arranged to project through a slot in said dial, which slot is of greater length than said slide, and a pointer or index, of the index or pointer carried by a ratchet or tooth-wheel and having a shoulder successively engaging said pins or projections of the slide, the graduated keys, and mechanism for the actuation of said ratchet or wheel through said keys, substantially as set forth.

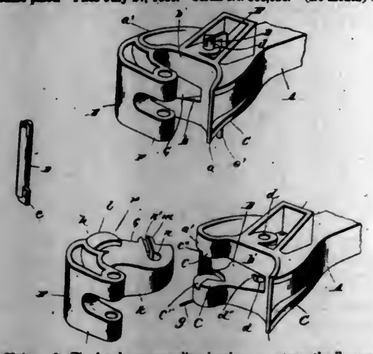


3. The combination of the graduated plate or dial, the slide arranged in a slot in said dial and carrying a series of pins or projections arranged to project through a slot in said dial, which slot is of greater length than said slide, and a pointer or index, the ratchet or tooth-wheel actuated by a lever-pawl and carrying an index or pointer having a shoulder successively engaging the pins of said slide, and the series of graduated keys of proportionately increased or graduated lengths and acting upon said lever and pawl, substantially as set forth.

414,143. MOP-HEAD. CHARLES R. CURTIS, Bangor, Me., assignor of one-half to Eugene M. Harvey, same place. Filed Jan. 7, 1889. Serial No. 295,663. (No model.)

Claim.—An improved mop-head consisting of the D-shaped casting having a handle-socket projecting from the portion opposite its straight side, and a spring-wire clamp bent to conform to the shape of the casting and having its ends formed in spiral springs and rigidly confined to the said casting, substantially as shown, and for the purpose described.

414,144. PROCESS OF MAKING HOLLOW GLASSWARE. JOHN R. CURTIS, Cambridge, assignor of one-half to Charles F. Martins, Boston, Mass. Filed June 11, 1888. Serial No. 276,715. (No specimens.)



Claim.—The process of making hollow glassware direct from the molten-glass composition, which consists in rolling the molten-glass metal material into a flat blank of uniform thickness, and then placing said blank, before cooling and while in a plastic condition, onto a former or mold and permitting it to cool and contract on said former, whereby it assumes the shape of the former, and finally removing the so-shaped blank from the former and annealing it, substantially as described.

414,146. FOOT-BRUSH. FREDERICK H. CURRIER, Oswego, N. Y. Filed Apr. 12, 1889. Serial No. 306,994. (No model.)

Claim.—As an improved article of manufacture, a foot-brush composed of the elongated base A, cross-walls *c c*, resting with their bases across the entire width of the base A and rigidly attached thereto to brace the same, two longitudinal walls *b b*, one of which is rigidly secured to the cross-walls and the other is inserted removably between the cross-walls, the broom inserted vertically in the space surrounded by the aforesaid walls, and ties *t t*, extending transversely through the longitudinal walls, substantially as described and shown.

414,146. CAR-COUPLING. ROBERT H. DOWLING, Newark, Ohio, assignor of two-thirds to Charles Follett and Charles H. Follett, both of same place. Filed July 27, 1889. Serial No. 318,020. (No model.)

Claim.—1. The hook car-coupling having an automatically-opening hook provided with an arc groove, in combination with the locking-key having an offset or stop at its lower end, the lower end of said key when elevated engaging said groove, substantially as specified.

2. The hook car-coupling having a spring-actuated automatically-opening hook, in combination with the locking-key, and the guide-rod having a laterally-extended upper end connected to the upper end of said key, substantially as specified.

3. The hook car-coupling having a spring-actuated hook, in combination with the locking-key and its uncoupling and guide rod, substantially as specified.

4. In a hook car-coupling, the hook locking-key provided with a detachable uncoupling and guide rod projecting below the draw-head, substantially as specified.

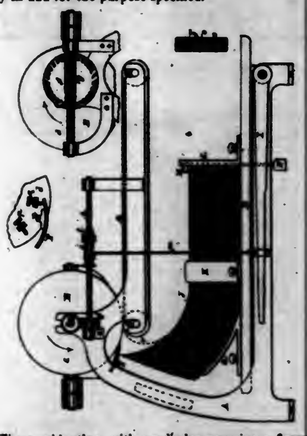
5. In a car-coupling, the combination, with a draw-head having stepped bearings facing outward in its cavity or chamber, and having on their inner sides angular stops, of the knuckle-hook having its concave shoulder-bearings and trunnion-bearings facing inwardly to engage the bearings of said draw-head, said trunnion ends being engaged by said angular shoulders, substantially as specified.

6. In a car-coupling, the draw-head having the oblique horn and rounded bearings oppositely disposed at the sides thereof, and the knuckle having the concave shoulder-hook portions, and the oblique convex edge-pressure arm extending backward and inward therefrom, in combination with a locking-key, substantially as specified.

7. In a car-coupling, the combination, with the draw-head having the oblique horn and rounded bearings oppositely disposed, of the knuckle having the concave shoulder-hook and tapered pressure-arm extending inward at an angle of forty-five degrees therefrom, the locking-key, its guide-rod, and opening-spring, substantially as specified.

8. In a car-coupling, the combination, with the draw-head having the stepped bearings and tapered cavity, of the concave-shouldered knuckle-hook, having the tapered perforated and grooved pressure-arm, the locking-key, and its guide-rod, substantially as specified.

414,147. PAPER-FEEDING MECHANISM. EDWARD DURKEE, Auburndale, Mass. Filed Apr. 30, 1887. Serial No. 236,732. (No model.)



Claim.—1. In a machine for feeding paper, the combination of a shaft *b*, two disks *c* and *d*, adjustable thereon, and a finger F, pivoted between said disks, substantially as specified.

2. The combination of a shaft *b*, two disks *c* and *d* thereon, a finger F, pivoted to said disks, and devices, as the set-screws *p* and *q*, for gaging the distance through which the finger may swing, substantially as set forth.

3. In a paper-feeding machine, a finger F, pivoted to a cylinder and adjustable in a direction transverse to its shaft or pivot-pins, said finger being provided with an exterior friction-surface, substantially as and for the purpose set forth.

4. In combination with a finger F and carrier therefor, means as the toothed wheel *f* and toothed cylinder *g*, for imparting a varying movement to said carrier, said finger being provided with an exterior friction-surface, substantially as specified.

5. In combination with a cylinder E, carrying a finger F, a table D, for supporting a bank of paper in such relation to the cylinder that the finger will come in contact with the edge face of the sheet, substantially as and for the purpose specified.

6. The combination, with a cylinder carrying a finger F and a roller G to co-operate with said cylinder as a gripper, of a table D, for supporting a bank of paper in such relation to the cylinder that the finger will engage with the edge face of the sheet, substantially as set forth.

7. The combination of a cylinder carrying a finger F, a roller G to coact with said cylinder as a gripper, a roller H, tapes or bands *e*, extending around said rollers, and a table D, located under the roller G and said tapes or bands, substantially as and for the purpose set forth.

8. In combination with a support for a bank of paper, a finger and carrier therefor, whereby the finger is caused to touch the edge face of the sheet and carry the edge of the sheet, substantially as specified.

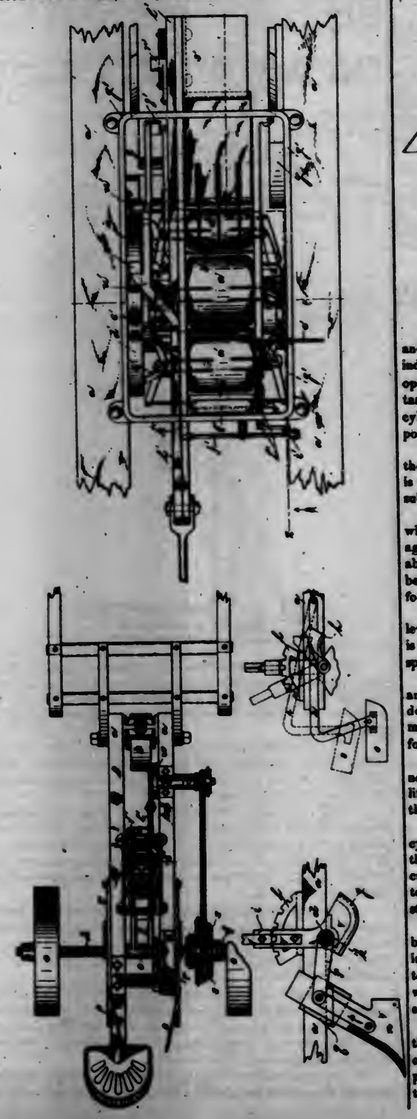
9. In combination with a pivoted table D, for supporting a bank of paper, a finger and carrier therefor, whereby the inclination of the bank is changed and the finger is caused to touch the edge face of each sheet and carry and bend the sheet, substantially as specified.

10. In combination with a finger and carrier therefor, a table so located as to present an edge face of a sheet to said finger, said table being provided with a raised portion or block O, to form or maintain a bend or curve in the bank of paper, substantially as specified.

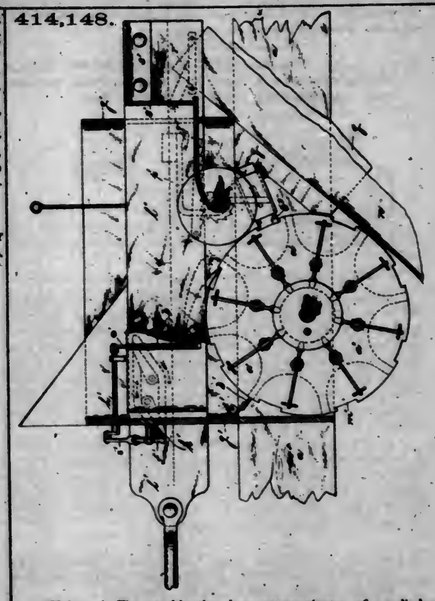
11. The combination, with a finger and carrier therefor, of a table so located as to present an edge face of a sheet to said finger, said table being provided with a raised portion or block O, for supporting a curved bank, and with a bracket or gage L, substantially as and for the purposes specified.

12. The combination of a cylinder E, bearing a finger F, pivoted table D, for supporting and moving the bank, a chain or rope *m*, a shaft *h*, bearing a drum *i*, on which said chain or rope winds, and a worm *k* and gear *j*, substantially as described.

13. In a paper-feeding machine, a table D, provided with a raised part to support the bank of paper at or near the end and with a bracket L, whereby the bank is maintained in a bent or curved form, the upper sheet prevented from sliding under the action of a finger pressing against its edge face, and so that an edge of each sheet projects or extends beyond the corresponding edge of the adjacent sheet, substantially as set forth.



14. In a paper-feeding machine, a movable instrument herein called a "finger," in combination with a support or table for a bank of paper located with reference to said instrument so as to present an edge of a sheet of said bank to the same, substantially as and for the purpose set forth.



15. In combination with an instrument herein called a "finger," a support located with reference to said instrument so as to present the edge face of a sheet of paper to the same, said instrument being movable, whereby it will engage with said edge face, and adjustable, whereby the pressure on said edge face may be gaged, substantially as set forth.

16. In combination with an instrument, herein called a "finger," a support located with reference to said instrument so as to present the edge face of a sheet of paper to the same, said instrument being automatically adjustable (in position) with reference to said edge face and movable transversely with reference to the edge of said sheet, whereby it will touch said edge face and carry and bend the sheet, substantially as specified.

17. In combination with an instrument herein called a "finger," a support located with reference to said instrument so as to present an edge face of a sheet to the same, said instrument being movable, its movement being variable, whereby it will engage with said edge face and while in contact therewith have a comparatively slow motion, substantially as set forth.

414,148. POTATO-PLANTER. SAMUEL H. PERE, Hinsdale, assignor of one-half to Henry C. Hitchcock, Clarendon Hills, Ill. Filed Nov. 8, 1884. Serial No. 147,493. (No model.)

Claim.—1. The combination, in a potato-planter, of a cylinder and means for driving the same step by step, forks carried by the cylinder and operated by cams, tongues carried by the cylinder and operated by a cam *d'*, and means for moving said cam *d'* a short distance, whereby the tongue most advanced is drawn back before the cylinder begins to move at each step, substantially as and for the purpose specified.

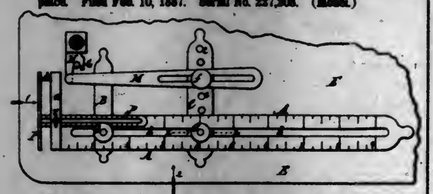
2. The combination, with the cam *d'*, provided with the lug, of the piece *d''*, carried by the reciprocating slide, whereby the said cam is moved back and forth a short distance as the slide reciprocates, substantially as and for the purpose specified.

3. The combination, in a potato-planter, with a cylinder provided with pockets and means for driving said cylinder step by step, of an agitator turned automatically inwardly to enlarge the pocket that is about to be filled, and means for turning said agitator outwardly just before the cylinder begins to move at each step, substantially as and for the purpose specified.

4. The agitator carried by the crank-shaft, the link and pivoted lever, and the cam *k'* in the reciprocating slide, whereby the agitator is turned outwardly and inwardly, substantially as and for the purpose specified.

5. The dog *o'*, in combination with the weighted bell-crank lever and the movable cam carried by the reciprocating slide, whereby the dog is disengaged from the cylinder at the beginning of the movement of the slide toward the rear of the machine, substantially as and for the purpose specified.

6. The combination, with the cylinder turned step by step, of the notches *m'* and the dog or detent *o'*, and means whereby the dog is lifted from one notch and forced into the next notch at each step of the cylinder, substantially as and for the purpose specified.

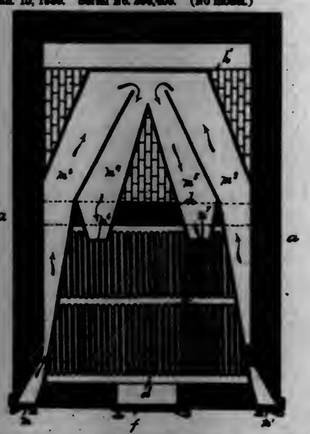


7. The combination, with the cylinder, of means for moving said cylinder step by step, and the agitator mounted upon the crank-shaft, the pivoted lever operated by cam *k'*, and the link connecting said crank-shaft with the pivoted lever, whereby the pocket that is about to be filled is enlarged and the potatoes caused to fall therein, substantially as and for the purpose specified.

8. The combination, with the slide and means for driving the same back and forth, of the bearings for said slide, provided in the casting which supports the hopper, the cylinder provided with forks and tongues, and mechanism carried by the said slide for giving the cam which operates the tongues a movement at each stroke of the slide, substantially as and for the purpose specified.

9. The combination, with the main lever, of cam *g*, provided thereon, the pivoted bell-crank lever provided with the bifurcated end or clutch which rests in the groove *n*, provided in the hub of a wheel placed upon the main shaft, said wheel, and a clutch secured rigidly to the driving-wheel, whereby the said wheel may be held so as to be

drives by said wheel or thrown out of gear therewith, as desired, substantially as and for the purpose specified.

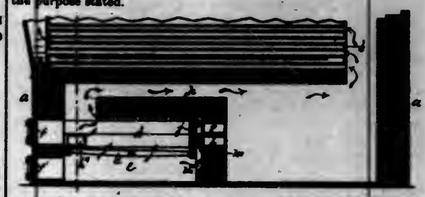


414,149. TUCKING-GUIDE FOR SEWING-MACHINES. HAYMAN FREEDMAN, Rochester, N. Y., assignor of one-half to Nathan Stein, same place. Filed Feb. 10, 1887. Serial No. 227,908. (Model.)

Claim.—1. In a tucker for sewing-machines, the combination of the bar A, slotted so as to be adjusted forward and back, the cross-head *a* on one end of the bar extending inward at right angles to a point nearly opposite to the needle and provided on its under side with a shoulder *a'*, that forms the guide on the inner side of the tuck, and the guide-bar P, consisting of a slotted shank *p*, passing through a slot of the cross-head *a*, and an outer cross-head of the same length and parallel to the cross-head *a*, forming the guide on the outer side of the tuck, as herein shown and described.

2. In a tucker for sewing-machines, the combination of the bar A, provided with the right-angled cross-head *a*, the guide-bar P, provided with a cross-head parallel to cross-head *a*, the bars B and C, attached to plate A and adjustable out and in, and the spring M, attached to bar C and resting on the toe of the cloth-presser, as shown and described, and for the purpose specified.

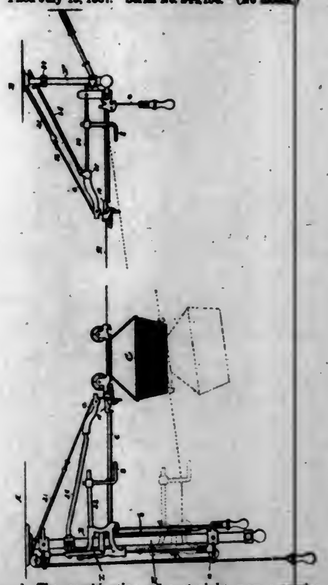
414,150. FURNACE. GEORGE F. GALLAGHER and THOMAS B. MOORE, Rochester, N. Y., assignors of one-third to Henry Gallagher, same place. Filed Jan. 15, 1889. Serial No. 296,403. (No model.)



Claim.—A furnace provided with the usual fire-box, ash-pit, and combustion-chamber, and having air-passages extending through the fire-box and combustion-chamber to the rear vertical flue or passage for conducting air from the outside to the rear of the combustion-chamber and thence to the fire-box, where it is discharged either at the front or back in a highly-heated state, substantially as and for the purpose stated.

414,151. FURNACE. GEORGE F. GALLAGHER and THOMAS B. MOORE, Rochester, N. Y., assignors of one-third to Henry Gallagher, same place. Filed Jan. 16, 1889. Serial No. 296,474. (No model.)

Claim.—1. In a furnace, air-passages, as shown, for conveying the air from the outside to the rear of the fire-box and discharging it therein in a heated state, such passages starting at the sides of the fire-box and returning at the center, substantially as shown and described.



2. The furnace having the ash-pit *c*, bridge-wall *m*, inner wall *j*, with passage *m'* between said walls and connecting the ash-pit and fire-box, and the arch *k* over the fire-box, substantially as and for the purpose stated.

3. In a furnace, the combination, with the air-passages *g h g' K*, arranged as shown, of the bridge-wall *m*, inner wall *j*, with passage *m'* between, and the arch *k* over the fire-box, substantially as and for the purpose stated.

4. In a furnace, air-passages, as shown, for conveying the air from the outside to the rear of the fire-box and discharging it therein in a heated state, such passages starting at the center of the fire-box and returning at the sides, substantially as shown and described.

414,152. STORE-SERVICE APPARATUS. EDWIN L. GILES, Lowell, Mass. Filed July 13, 1887. Serial No. 244,156. (No model.)

Claim.—1. The combination of a straight way, a carrier supported thereon, a propelling device movable in a line parallel to the way and supported in a position above and connected with the way, and means for raising and lowering the end of the way, substantially as described.

2. The combination of a way, a carrier supported thereon, a propelling device supported above the way and provided with a slide mounted on the way, and means for raising and lowering the end of the way, substantially as described.

3. The combination, with the standard, a carriage adjustably mounted thereon and supporting one end of a way, of a carrier-impelling device located at that end of the way, and a connection, such as the cord *d*, between the carriage and the impelling device to cause the latter to adjust itself when the position of the carriage is adjusted, substantially as described.

4. The combination of a way, an adjustably-mounted carriage supporting one end of the way, an impelling device, also connected to said carriage, and a slide 10, connected to the impelling device and adapted to move with the adjusting movement of the carriage, substantially as described.

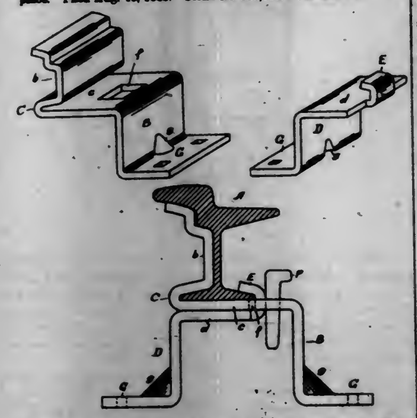
5. The combination of a way, an adjustably-mounted carriage supporting one end of the way, an impelling device, also connected to said carriage, and a slide 10, connected to the impelling device and mounted on the way, to move therewith in the adjusting movement of the carriage, substantially as described.

6. The combination of a way, a support, a carriage adjustably mounted thereon and carrying one end of the way, a rod, as 22, carried by said carriage, and a stop adjustably mounted on said rod, substantially as described.

7. The combination of a way, a support, an arm 24, mounted on said support, a carriage adjustably mounted on the support and carrying one end of the way, a stop, as 8, also carried by said carriage, and a carrier-impelling device, substantially as described.

8. The combination of a standard, a way, a carriage mounted on the standard and supporting one end of the way, and a bifurcated lever-catch pivoted to the carriage and adapted to straddle the standard, substantially as described.

9. The combination of a way, a bracket, as arm, as 31, supported thereby and having a pivoted end piece to which one end of the way is secured, an impelling device, the horizontal arm 34, providing a guide for one portion of said device and adjustably connected to said arm 31, and the adjustable brace-bar 36, substantially as described.



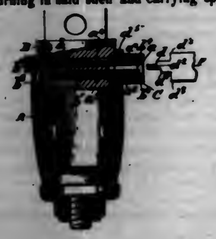
10. The combination of a way, a bracket for supporting one end thereof, an impelling device, the horizontal arm 34 and pivoted brace-bar 36, and the adjustable supports 35 37, substantially as described.

11. The combination of the pulleys 7, slide 10, propelling-cord, and the yokes 39 40, substantially as described.

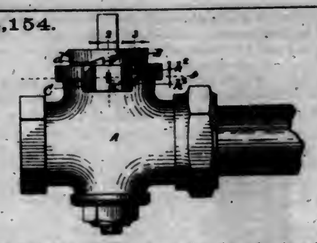
12. The combination of a way, a carrier supported thereby, propelling-cord C, a propelling-spring, and a yoke 39, connecting the cords to the spring, substantially as described.

13. The combination of the pulleys 7, propelling-cords passing thereover, a propelling-spring, and a yoke 39, connecting the ends of the cords to the spring, substantially as described.

414,153. TWO-PART CHAIR FOR RAILROAD-RAILS. HENRY S. GOODSPEED, Johnstown, Pa., assignor to the Johnson Company, same place. Filed Aug. 16, 1889. Serial No. 320,966. (No model.)



Claim.—A two-part rail-chair provided with a main and auxiliary base, the two parts interlocked by a clip and key.



414,154. LOCK FOR SHUT-OFF VALVES. GEORGE B. HAINES, Chicago, Ill., assignor of one-half to Edwin T. Brooks, same place. Filed Oct 23, 1888. Serial No. 288,980. (No model.)

Claim.—1. In a shut-off valve, the valve-shell, provided with the internal segmental groove *g*, in combination with the valve-plug turning in said shell, and carrying locking-bolts in line with the passage therethrough adapted to enter the groove, said groove being of sufficient length to permit the valve-plug to be turned from an open to a closed position without unlocking the same, substantially as described.

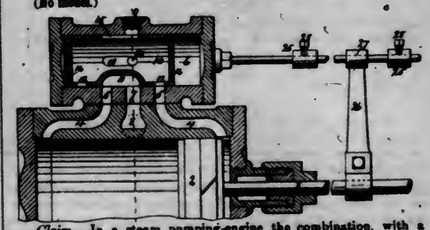
2. In a shut-off valve, the valve-shell, provided with the internal segmental groove *g*, having key-apertures at one end, in combination with the valve-plug turning in said shell and carrying spring-seated

414,154.

locking-bolts in line with the passage therethrough, adapted to enter the groove, said groove being of sufficient length to permit the valve-plug to be turned from an open to a closed position, whereby the plug may be locked in such position as to be either open or closed, and, by the insertion of a key in the apertures, may be unlocked and given a further movement, substantially as described.

3. In a shut-off valve, the valve-shell, provided with a recessed projection C on one side, carrying bolt-sections of different lengths and having a key-hole therein, the shell being also provided with an internal segmental recess *g* with key-apertures at one end, in combination with the valve-plug, carrying spring-seated locking-bolt sections of equal length in line with the opening therethrough, substantially as and for the purpose set forth.

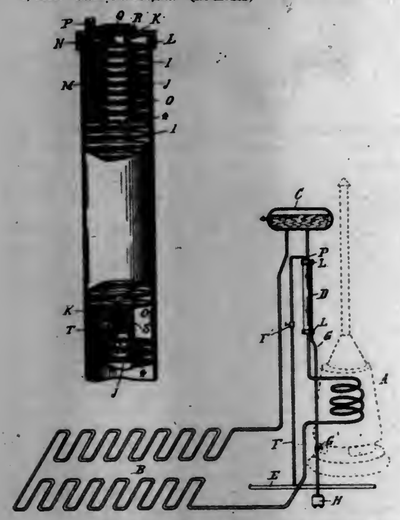
4. In a shut-off valve, the valve-shell, having the internal segmental groove *g* with key-apertures at one end, and provided with the recessed projection C on one side, having a key-hole therein, in combination with the valve-plug, turning within the shell and carrying spring-seated locking-bolts in line with the opening therethrough, the internal groove being of such length as to permit the plug to be turned from an open to a closed position when the locking-bolts are in engagement therewith, and the recessed projection C being located on the side of the shell, so that when the locking-bolts are in engagement therewith the plug will be locked in a closed position, substantially as described.



414,155. ELECTRIC FIRE-SIGNAL. CHARLES B. HEAD, Allegheny, Pa. Filed Apr. 15, 1889. Serial No. 307,223. (No model.)

Claim.—1. In an electrical signaling apparatus, the combination, with an electric circuit embracing a battery and signaling device, of two rigid terminals, one of which is provided with a cup into which the other terminal dips, an interposed insulator which separates the rigid terminals, and an interposed fusible plug, substantially as and for the purposes described.

2. In an electrical signaling apparatus, the combination, with an electric circuit embracing a battery and signaling device, of two rigid terminals, one of which is provided with a perforated cup into which the other terminal dips, an interposed insulator which separates the rigid terminals, and an interposed fusible plug, substantially as and for the purposes described.



414,156. STEAM PUMPING-ENGINE. CHARLES L. MARRINER, Columbus, Ohio, assignor of two-thirds to John D. Wells and Wm. H. Wetzman, both of same place. Filed July 16, 1888. Serial No. 317,710. (No model.)

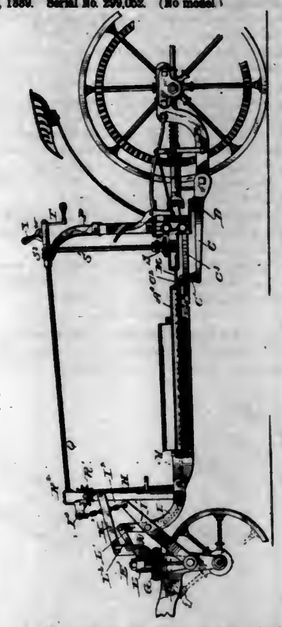
Claim.—In a steam pumping-engine, the combination, with a main valve-chest having live-steam ports and an exhaust-port and a hollow valve within the same provided with main steam-ports and having holes in its ends, of a smaller auxiliary valve-chest 18, having channels 17 at its ends, which connect with the ends of said valve-chest and one exhaust-channel 22 at its middle, which directly connects with the exhaust-channel of the main valve-chest, and a solid

cylindrical valve 23 within said auxiliary valve-chest and provided with a rod 24, directly connected to the operating parts of the engine to be reciprocated by the same, substantially as described.

414,157. WATER-HEATER. JAMES F. MCILROY, Albany, N. Y., assignor to the McIlroy Car Heating Company, same place. Filed July 1, 1889. Serial No. 316,240. (No model.)

Claim.—1. In combination with a hot-water-circulating apparatus, a water-heater consisting of a series of hollow annular plates axially arranged, having connections at their inner edges arranged in the line of circulation, an outer casing, and a steam-space between and a suitable steam inlet and exit connection to said steam-space, substantially as described.

2. A water-heater adapted to be used with a hot-water-circulating apparatus, consisting of an outer casing having caps, steam inlet and outlet openings in said caps, and an inner water-chamber having nipples at the ends secured in apertures in the said caps, said water-chambers consisting of a series of hollow annular plates and secured together at their inner edges, with the apertures in line, having the water-spaces *a*, connecting with said central apertures, substantially as described.



414,158. FLUSHING-VALVE FOR WATER-CLOSETS. ALEXANDER MCKAY, Detroit, Mich. Filed May 18, 1889. Serial No. 311,321. (No model.)

Claim.—1. The combination of the cistern, the valve-case consisting of two parts each having screw-threaded engagement, the discharge-port and valve-seat located in the upper part, the induct-port in the under part, the cylinder suspended in said induct-port, the valve-stem carrying a piston-head at its lower end and a valve near its center, the coiled spring encircling the valve-stem, and the yoke supporting the lower end of said spring, the aperture *i* in said stem, and aperture *i'* communicating therewith and opening horizontally through the valve-stem and communicating with the cistern, substantially as specified.

2. In combination with the cistern, the valve-case suspended therefrom, said valve-case consisting of two parts, the upper part having the fixed collar, discharge-port, the valve-seat, the threaded part *a*, the screw-threaded collar *c*, the lower part having the induct-port, the cylinder suspended in said induct-port being formed integral with the lower part of the valve-case, which is also internally screw-threaded at *a'*, as and for the purposes set forth.

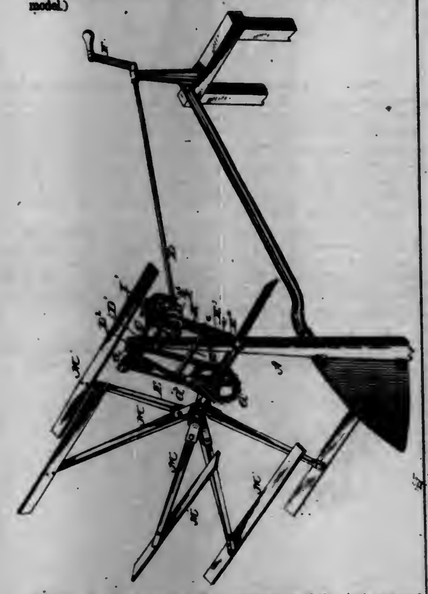
414,159. HARVESTER-FRAME AND MEANS FOR RAISING AND LOWERING THE SAME. MARION L. NICHOLS, New York, N. Y. Filed Feb. 7, 1889. Serial No. 299,052. (No model.)

Claim.—1. The combination of the master-wheel-supporting frame, the main frame, to which the same is connected by a pivotal connection, the master-wheel frame having a forwardly-extending reach engaging a trackway on the main frame, and mechanism connected to the front-supporting-wheel holder to engage the forwardly-extending reach on one side only of the pivotal connection of the main frame, substantially as and for the purpose set forth.

2. The combination, with the master-wheel frame supported at one end on a trackway on the main harvester-frame and carrying at the other the master-wheel and having a pivotal connection with the main frame between its support on the main frame and the axle of the master-wheel, of a locking device connected through arms and levers with the front-supporting-wheel holder and arranged to engage and lock the master-wheel frame in one direction only, substantially as described.

3. The combination of the front-supporting-wheel holder, a lever for controlling the movements of the master-wheel rigidly connected to said holder, a rod connected to said lever at one end and at its other to a dog, a dog mounted on the harvester-frame, and a master-wheel frame having a pivotal connection with the harvester-frame, and having a forward extension to be engaged by the dog, substantially as and for the purpose set forth.

4. The combination of the front-supporting-wheel frame, the lever rigidly connected therewith, the upright rocking lever, the link connecting these two levers, the rod connected to the rocking lever at one end and connected to a pivoted locking-dog at the other, and a laterally-swinging master-wheel frame pivoted to the machine-frame, and having a forwardly-extending reach to engage a trackway on the machine-frame and to be engaged by the dog, substantially as and for the purpose set forth.



5. The combination of the front-supporting-wheel holder, having the tongue pivoted thereto, a saddle with which the wheel-holder is pivotally connected, levers connecting the saddle with the main harvester-frame, and lifting-chains connected with said levers and the main frame, and the link connecting the saddle with the harvester-frame, substantially as described.

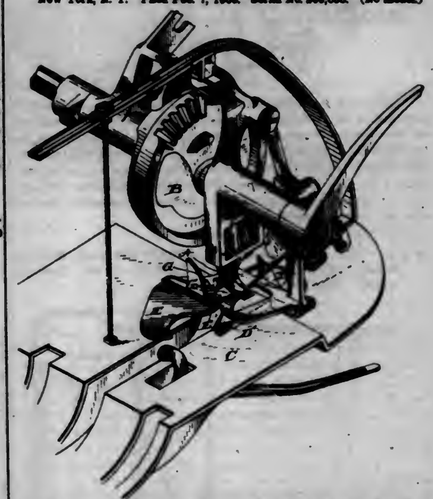
6. The combination of the shaft for controlling the height of the cutters in relation to the ground, a gear fixed thereto, a gear and crank loosely mounted thereon, and mechanism for connecting the crank either with the shaft or with the loose gear, or all together, substantially as described, whereby the frame may be adjusted at each end simultaneously or either end independently of the other by a single operating-lever, as set forth.

7. In a lifting device for controlling the height of cut in harvesting and binding machines, the combination of the operating-shaft carrying at one end a worm or gear fixed thereto and at its other a worm or gear and crank loosely mounted thereon, and said shaft having a groove formed therein at the end on which the crank is mounted, the crank-hub and gear or worm having their abutting ends notched, and a two-armed pawl pivoted on the hub of the crank and adapted by engaging the notch in the hub of the gear and grooved shaft either to lock the gear to the shaft or the crank to the gear, or all together, as set forth.

8. In harvesting and binding machines, the combination of the machine-frame, the front-supporting-wheel saddle, to which the front supporting-wheel is connected, the operating-shaft having a worm or gear rigidly secured to one end to control the movements of the frame in relation to the front wheel, a perpendicularly-arranged shaft, to which the chain controlling the movements of the grain-wheel is connected, having a gear mounted on its upper end, a worm or gear loosely mounted on the operating-shaft to engage the gear on the perpendicular shaft, a crank also loosely mounted on the operating-shaft adjacent to the loose gear, and a two-armed pawl pivoted on the hub of the crank, substantially as and for the purpose set forth.

414,160. REEL FOR HARVESTING-MACHINES. MARION L. NICHOLS, New York, N. Y. Filed Feb. 7, 1889. Serial No. 299,054. (No model.)

Claim.—1. In a harvester, the combination of the reel-post and the head mounted thereon, provided with bearings for the supporting and adjusting shaft, and also for the shaft carrying the adjusting mechanism for the gear, formed in one piece, substantially as described.



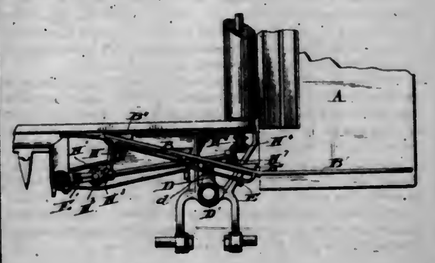
2. In a harvester, the combination of the reel-post head, the reel-supporting shaft journaled in the head and having the reel-supporting frame secured thereto, the reel-adjusting wheel rigidly secured to the frame, the bevel-pinion mounted loosely on the shaft, the sprocket-wheel secured to said pinion, the reel-shaft journaled in said frame, the sprocket-wheel mounted thereon, and the pinion mounted on the driving-shaft in the reel-post engaging the pinion on the supporting-shaft, substantially as described.

3. In a harvester, the reel-spider composed of a series of separate heads provided with two arms located in line with each other, and a separate beater connected with each of said arms, and devices, substantially as described, for holding the several heads either in line or at angles to each other, as set forth.

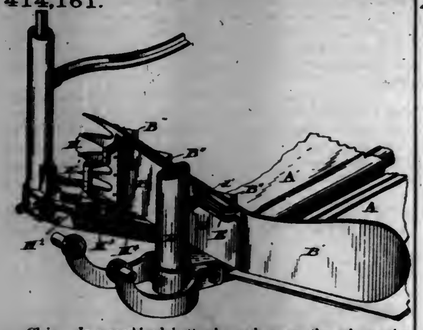
4. In a harvester, the reel-spider composed of the hollow sleeved shaft mounted on the reel-shaft and provided with arms or plates, and the heads mounted on said sleeved shaft, also provided with arms or plates, devices for connecting the hollow sleeved shaft to the reel-shaft, and means for holding the end head engaged with the hollow sleeve and all the heads in a fixed relation to each other, substantially as described.

5. In a harvester, the hollow sleeved shaft mounted on the reel-shaft, having two of the reel-supporting plates or sockets formed therewith, the hubs mounted on the sleeved shaft and provided with the other plates or sockets, said hubs provided with notches and lugs to engage each other, and the set-screws for securing the sleeved shaft to the reel-shaft and the hubs in relation to each other, as set forth.

414,161. TUCKER FOR GRAIN-BINDERS. MARION L. NICHOLS, New York, N. Y. Filed Feb. 7, 1889. Serial No. 299,055. (No model.)



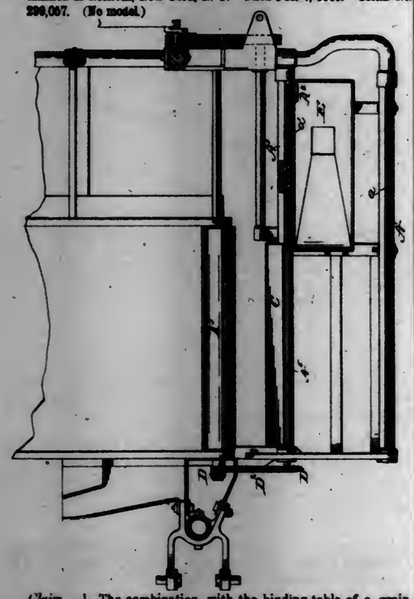
Claim.—1. The shield or breast-plate provided with the raised overlaying lip or flange, arranged upon one side of the slot formed therein, in combination with a tucker pivoted on the opposite side of the slot in such position as to have its point or toe move under the lip or flange in carrying the twine to the knotter, substantially as described.



2. The combination of the shield or breast-plate having the twine-slot curved backward at a point under the knotter, the raised overlaying lip or flange on one side of the slot having its edge adjacent to the slot formed on an angle corresponding to the angle of the slot, the tucker pivoted on the opposite side of the slot, and a twine-guide and stripper for actuating said tucker, substantially as described.

3. The combination of the shield or breast-plate having the raised overlaying lip or flange arranged at one side of the slot formed therein, the tucker pivoted at the opposite side thereof, having the enlarged heel end to extend over the slot, and the toe to move under the lip, substantially as described.

414,162. BUTT RAKE AND EVENER FOR GRAIN-BINDERS. MARION L. NICHOLS, New York, N. Y. Filed Feb. 7, 1889. Serial No. 299,056. (No model.)



414,161.

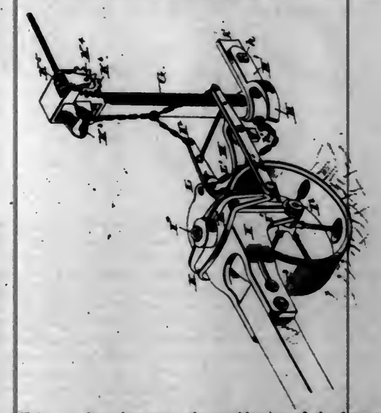
Claim.—In a combined butt rake and evener, the rake portion arranged to act on the grain at the discharge end of the canvas, and the extension or evener rigidly connected thereto, extending over the binding-table, said parts having a pivotal connection with the harvester-frame near their point of union, and devices connected near one end for actuating the same, substantially as described, whereby both a vibratory and reciprocating movement is imparted to the butt rake and evener, as set forth

414,163. GRAIN-SAVING ATTACHMENT FOR GRAIN-BINDERS. MARION L. NICHOLS, New York, N. Y. Filed Feb. 7, 1889. Serial No. 299,057. (No model.)

Claim.—1. The combination, with the binding-table of a grain-binder, of an open-sided hollow bar located under the edge of the table into which the grain is guided, a conveyer located therein, and a box or receptacle to which the loose grain is carried by the conveyer through the hollow bar or tube, substantially as set forth.

2. The combination, with the binding-table of a grain-binder, of an open-sided hollow frame-bar located under the edge of the table into which the grain is guided, a conveyer located therein, and a box or receptacle to which the loose grain is carried by the conveyer through the hollow frame-bar, substantially as set forth.

3. The combination, with the binder-table, the inclined board extending over the receiving-edge of the same, the open-sided hollow frame-bar, the apron for directing the loose grain thereto, the conveyer located in the same, and a box or receptacle to which the loose grain is conveyed by the conveyer, substantially as and for the purpose set forth.

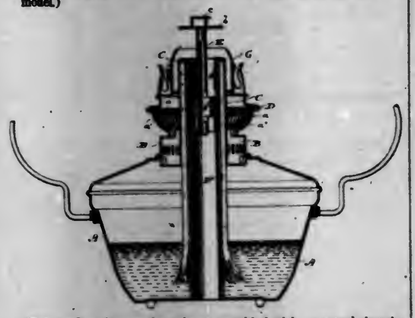


414,164. HARVESTING-MACHINE. MARION L. NICHOLS, New York, N. Y. Filed Feb. 12, 1889. Serial No. 299,506. (No model.)

Claim.—1. In a harvester, the combination of the saddle, the lifting-levers pivoted to the main frame and having pivotal connections with the saddle, lifting devices connected to the levers, a front supporting-wheel holder having a swivel-connection with the saddle, a gear mounted on the wheel-holder, and a tongue carrying a gear to actuate the gear on the front-supporting-wheel holder, substantially as described, whereby the main frame may be raised and lowered relatively to the front supporting-wheel, while permitting the front supporting-wheel to be turned, as set forth.

2. In a harvester, the combination of a swiveling front supporting-wheel, a tongue, gearing actuated by the tongue for controlling the movements of said front supporting-wheel provided with engaging delay-surfaces, substantially as described, whereby the tongue shall have sufficient side play consequent to the movement of the team without acting on the wheel, as set forth.

414,165. HARVESTING-MACHINE. MARION L. NICHOLS, New York, N. Y. Filed Feb. 12, 1889. Serial No. 299,507. (No model.)

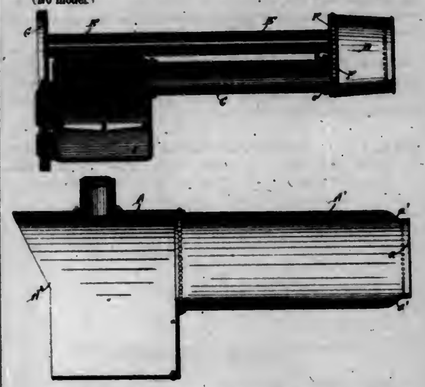


Claim.—1. In a harvester, the combination of the front supporting-wheel frame, a saddle with which the front-wheel frame has a swivel-connection, and levers connected to the saddle and to the main frame for changing the relation of the cutters to the ground.

2. In a harvester, the combination of the master-wheel frame having a rigid connection with the main frame, a front supporting-wheel frame having the tongue rigidly connected thereto, a saddle to which the front supporting-wheel frame is swiveled, and levers connected to the saddle and to the main frame for changing the relation of the cutters to the ground, substantially as set forth.

3. In a harvester, the combination of the front supporting-wheel frame, a saddle to which the wheel-frame is swiveled, and levers connecting the main frame and saddle for raising and lowering the cutters, and a stay-chain uniting the main frame and wheel-frame for limiting the swivel movement of the wheel-frame relative to the saddle, substantially as set forth.

414,166. LAMP-BURNER. JOHN NICKELS, Milwaukee, Wis., assignor, by direct and mesne assignments, of one-half to Frederick C. Hanford, Joseph C. Cordes, Horace M. Battin, Thomas A. McCarthy, and Deming H. Hatfield, same place, Frank W. Wood, Racine, and Daniel P. Sanford, Madison, Wis. Filed May 24, 1888. Serial No. 274,922. (No model.)



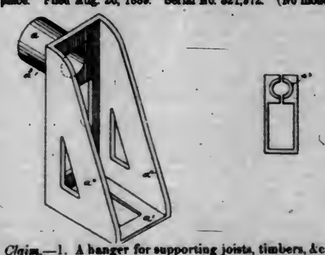
Claim.—In a burner for a lamp provided with a central air-tube, the combination of a tube centered in said air-tube and rising above the same, with a barrel surrounding the lower end of said inner tube, having its sides slitted both vertically and horizontally and secured to the periphery of said inner tube, a deflector surrounding the upper end of the last-named tube and of greater diameter than that of the air-tube of the lamp, and a smaller disk supported on legs rising from the last-named deflector and serving as a deflector for the air passing up through the said inner or smaller tube, substantially as set forth.

414,167. BOILER. WILLIAM J. RANTON, Syracuse, N. Y., assignor to the Porter Manufacturing Company, (Limited,) same place. Filed July 3, 1889. Serial No. 316,433. (No model.)

Claim.—In a boiler, the combination of a boiler-extension A', having the material of its outer extremity bent inward and forming a contracted opening, with the adjacent metal thereof conically inclined rearwardly therefrom, and a conical smoke-box adapted to be inserted from the rear of said boiler and formed with its rearward end of slightly less diameter than the interior of the boiler, whereby a great number of flues may be connected therewith, and formed with its smaller end at the front, whereby its insertion is greatly aided, said forward end of the smoke-box inclining in substantially the same angle as the metal of said contracted opening, whereby a tight joint is effected, substantially as and for the purpose set forth.

414,168. PROCESS OF CONSTRUCTING BOILERS. WILLIAM J. RANTON, Syracuse, N. Y., assignor to the Porter Manufacturing Company, (Limited,) same place. Filed July 3, 1889. Serial No. 316,434. (No model.)

Claim.—1. The herein-described process of constructing boilers, the same consisting of forming the outer shell, then securing together the interior parts of the boiler, and finally forcing said interior parts into operative position within said shell, substantially as described.



2. The herein-described process of constructing boilers, the same consisting in forming the outer shell, securing together the interior parts of the boiler, securing the flues in operative position, and then forcing the interior parts of the boiler to their operative position within the shell, substantially as described.

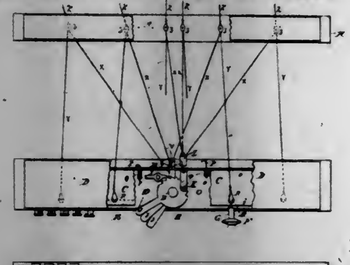
3. The herein-described process of constructing boilers, the same consisting of calking the flue before its placing within the boiler-shell, substantially as described.

4. The herein-described process of constructing boilers, the same consisting of forming the outer shell, securing together the interior parts of the boiler, securing the flues to the flue-sheets, calking the fire-flue from the outside thereof, and then securing said interior parts within the boiler-shell, substantially as described.

5. The herein-described process of constructing boilers, the same consisting of forming the outer shell, bending inward the forward extremity of said shell and forming a contracted opening, bending or turning a boiler-plate into a conical-shaped smoke-box, securing flues in the crown-sheet at the rearward large extremity of said conical-shaped smoke-box, placing the fire-box in relative position in relation to said smoke-box, securing the fire-flue to said fire-box and crown-sheet in the smoke-box, then forcing the said parts within the outer shell, and finally riveting the forward small extremity of the conical-shaped smoke-box to the contracted opening at the forward extremity of the boiler-shell, substantially as and for the purpose set forth.

414,169. HANGER FOR JOISTS. WILLIAM REUSCHEL, Cleveland, Ohio, assignor to Israel J. Lehman and Theodor Schmitt, both of same place. Filed Aug. 26, 1889. Serial No. 321,972. (No model.)

Claim.—1. A hanger for supporting joists, timbers, &c., the same comprising a vertical plate or frame having a boss or projecting member on the one side and below the upper edge thereof for attaching



the hanger to the supporting part of the structure, the opposite side of the hanger being provided at a point below the boss with a seat for receiving the joist or timber to be supported, substantially as set forth.

2. A hanger for supporting joists, &c., the same comprising a vertical plate or frame, a hollow cylindrical boss projecting from one side thereof, and a seat projecting from the other side of said frame, the said seat being in a plane below the boss, substantially as set forth.

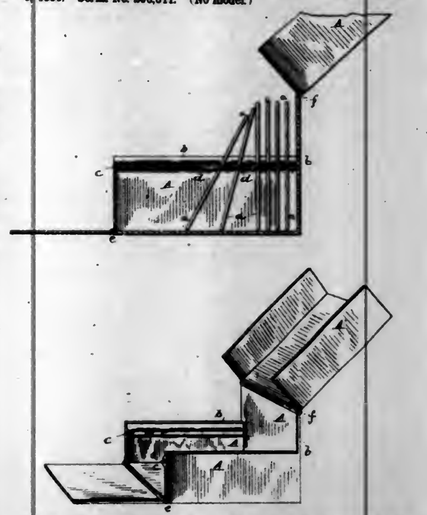
3. A hanger for supporting joists, &c., the same comprising a vertical plate or frame, a cylindrical boss projecting from one side thereof and provided with ribs, and a seat projecting from the other side, the said seat being in a plane below the plane of the boss, substantially as set forth.

4. A hanger for supporting joists, &c., the same comprising a vertical frame the upper section of which is in two sections, a sectional cylindrical boss formed on one side of the upper section of the frame, and a seat projecting from the opposite side of the lower portion of the frame, substantially as set forth.

414,170. MECHANICAL-TELEPHONE EXCHANGE. GEORGE F. SHAVER, New York, N. Y., assignor to the Shaver Corporation, same place. Filed Mar. 11, 1889. Serial No. 302,936. (No model.)

Claim.—1. A movable vibrator L, for connecting mechanical-telephone lines, consisting of a spring *l*, terminating in a hook at either end and provided with a damper *l'*, in combination with a tension-setting device and a series of mechanical-telephone line-terminals, whereby parallel lines may be connected together through the vibrator for intercommunication without loss of power or distinctness of articulation, substantially as herein set forth.

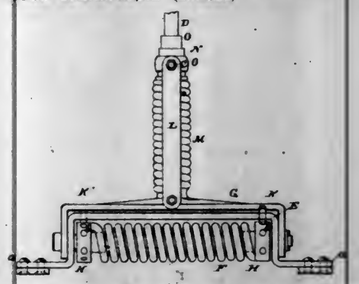
2. In a mechanical-telephone exchange apparatus, a vibrator L, consisting of a spring, a vibrator M, consisting of a bar hooked at one end and provided with a button-shaped head resting upon an elastic cushion, and a vibrator N, consisting of a bar terminating in hooks and perforated at its center to receive a supporting-bolt *n*, a supporting-shaft B, common to all the vibrators, tension-setting devices H I J K, and a series of mechanical-telephone lines and auxiliary-line terminals, substantially as herein set forth.



3. A device for connecting mechanical-telephone lines together for intercommunication through a central office or exchange, consisting of auxiliary terminal wires X-X, one end of each being permanently attached to the main-line wires at a point distant from the ends thereof and the other end being movable, in combination with the said main-line wires and a vibrator and tension-setting device, whereby communication may be established between any pair of main lines by attaching their respective auxiliary terminal wires to a vibrator and imparting tension to the same, substantially as herein set forth.

4. In an apparatus for connecting mechanical-telephone lines, a tension-setting-device consisting of a ratchet H, pawl I, and yoke K, and lever J, mounted upon a shaft B, in combination with a series of mechanical-telephone lines and a vibrator adapted to engage with and transmit vibrations from one connected line to another, substantially as herein set forth.

5. In a mechanical-telephone exchange apparatus, an adjustable support for the entering wires, consisting of a loop *z*, interposed in and forming a part of the said wires, in combination with a supporting-wire *z'*, passing through the said loop, whereby the said line-wire may be free to move upon its support during the action of setting tension upon connected wires, substantially as set forth.



6. In a mechanical-telephone exchange, a support for auxiliary-line terminals, consisting of a frame or rack o, having a series of pins P mounted thereon and passing loosely through said frame, the said pins terminating at one end in a hook and at the other end in a flattened head *p*, in combination with a retracting-spring Q, interposed between the head *p* and rack o, whereby the said auxiliary-line terminals are kept taut by the action of the spring and crossing of the line-terminal wires is prevented, substantially as herein set forth and described.

414,171. PHOTOGRAPH-CABINET. SIDNEY G. SHERWOOD, Buffalo, N. Y., assignor of one-half to Joseph E. Barnard, same place. Filed Feb. 6, 1889. Serial No. 298,811. (No model.)

Claim.—As a new article of manufacture, a photograph cabinet or holder consisting of the oblong box A, having the hinged front and top, the cabinet having on its inner sides slots or grooves *c*, in combination with the photograph cases or frames *a*, having pins or projections *d* on their sides adapted to slide in the grooves *c* of the cabinet, substantially as described.

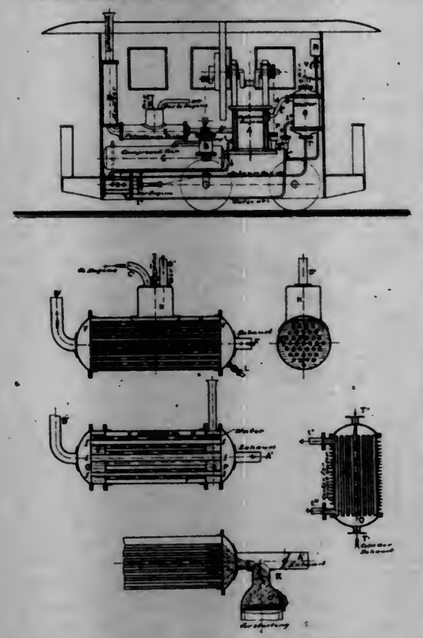
414,172. ELECTRIC RAILWAY. FRANK J. SPRAGUE and PATRICK F. O'SHAUGHNESSY, New York, N. Y., assignors to the Sprague Electric Railway and Motor Company, same place. Original application filed Jan. 22, 1889, Serial No. 297,216. Divided and this application filed Sept. 7, 1889. Serial No. 323,271. (No model.)

Claim.—1. The combination, with an electric-railway car, of a contact device carried thereby, a support for said contact device, and two springs forming parts of said support, one permitting longitudinal inclination and the other transverse inclination of said support, and a stop for said last-named spring, preventing the yielding thereof longitudinally of the car, substantially as set forth.

2. The combination, with an electric-railway car and a contact device carried thereby, of a horizontally-placed spiral spring and a vertically-placed spiral spring supporting said contact device, substantially as set forth.

3. The combination, with an electric-railway car, of a contact device, a pole carrying said contact device, a vertically-placed spiral spring carrying said pole, a pivoted support for said spiral spring, and a horizontally-placed spiral spring exerting a pressure upon said pivoted support, substantially as set forth.

4. The combination, with an electric-railway car, of a contact device, a pole carrying said contact device, a vertically-placed spiral spring supporting said pole, and a stop limiting the movement of said spring, substantially as set forth.

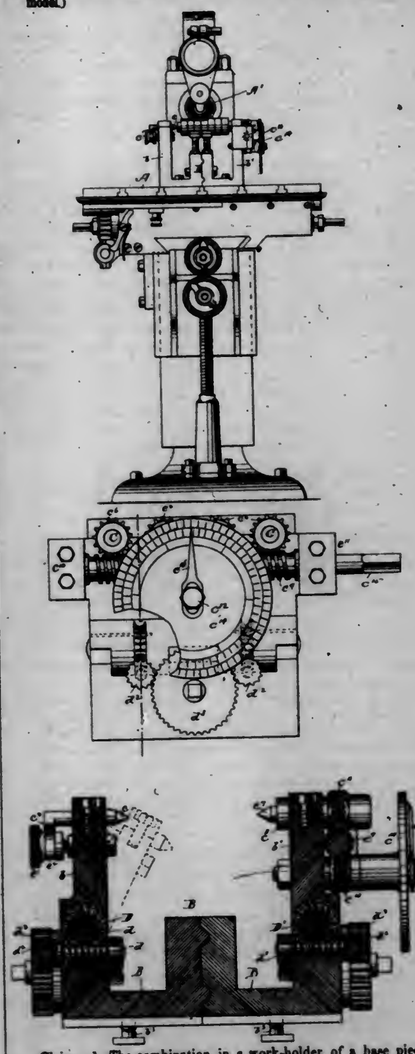


5. The combination, with an electric-railway car and a contact device, of a pole carrying said contact device, pivoted links supporting said pole, and a vertically-placed spiral spring connected with said pole and said links, substantially as set forth.

6. The combination, with an electric-railway car and a contact device, of a pole carrying said contact device, a vertical spiral spring carrying said pole, a horizontal bar supporting said spring, and a horizontally-placed spiral spring exerting a pressure on said bar, substantially as set forth.

7. The combination, with an electric-railway car, of a transverse horizontal spindle, a spiral spring coiled thereon, a pivoted transverse bar, turning sleeves on said spindle carrying said bar, with which sleeves said spring is connected, a pole carried by said bar, and a contact device carried by said pole, substantially as set forth.

8. The combination, with an electric-railway car, of a transverse horizontal spindle, a spiral spring coiled thereon, a pivoted transverse bar, adjustable turning sleeves on said spindle carrying said bar, with which sleeves said spring is connected, a pole carried by said bar, and a contact device carried by said pole, substantially as set forth.



414,173. COMBINED GAS AND COMPRESSED-AIR ENGINE. EMANUEL STEVENS, Brussels, Belgium, assignor of one-half to James Morison Burnup, London, England. Filed Nov. 6, 1888. Serial No. 290,143. (No model.) Patented in Belgium Mar. 16, 1887, No. 76,731; in England Mar. 31, 1887, No. 4,843; in France Sept. 15, 1887, No. 185,874, and in Germany Oct. 7, 1887, No. 43,059.

Claim.—1. The combination of a gas-motor A, having one or more jacketed cylinders and driving an air-compressing pump B, an air-motor D, also having one or more jacketed cylinders, and a refrigerator O, also jacketed, wherein cold is produced by the expansion of the exhaust-air from the air-motor, the jackets of the cylinders aforesaid and of the refrigerator being in connection, whereby a current of water may be caused to flow through the said jackets, the whole combined and acting substantially as and for the purposes described and set forth.

2. The combination, with the motor comprising the apparatus A, B, D, and O, as set forth, of a carburetor consisting of a tubular boiler E, wherein the evaporation of the carbureting liquid may be effected by the exhaust gases from the gas-motor A, and comprising the tubes F or the tubes F and *f*, substantially as and for the purpose set forth.

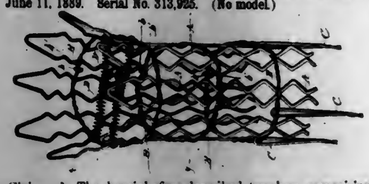
414,174. WORK-HOLDER FOR MILLING-MACHINES. CHARLES H. TRASK, Lynn, Mass. Filed Mar. 12, 1888. Serial No. 266,936. (No model.)

Claim.—1. The combination, in a work-holder, of a base piece or frame having supports, an arbor sustained by said supports and having a worm-wheel c^2, a worm c^3, an independent worm-wheel c^{12}, a rotary dial connected with the last-named worm-wheel, and a stationary index co-operating with said dial.

2. The combination, in a work-holder, of a base piece or frame B, having an adjustable support hinged thereto above the bottom of said base-piece, a worm-wheel *d*, rigid with said hinged support, and a worm d', journaled in the said base-piece and engaging said worm, whereby by turning said worm the said support may be adjusted to different angular positions.

3. The combination, in a work-holder, of the base piece or frame having the supports b-b', provided with the centers c-c^2, and the arbor carried by said supports, both of the latter being adjustable from a vertical position to vary the angle of the said arbor, substantially as set forth.

4. The combination, in a work-holder, of a support, one or more

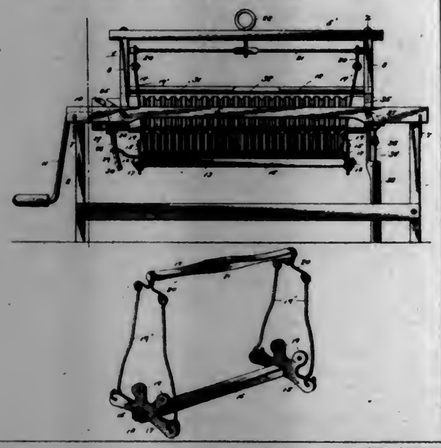


centers mounted thereon, the worm-wheels rigidly secured thereto, the said support being hinged to a base-piece, the worms d', carried by said base-piece, the gear-wheels d^2, and a common actuating-gear d^3, substantially as described.

5. The combination, in a work-holder, of a support b, one or more centers c, carried thereby, the said support being hinged to a base-piece, the support b', supporting one or more centers c^2, hinged to a base-piece and movable from a perpendicular position, devices for moving said supports b b' from a vertical to an inclined position, and for locking them in such position, the arbors carried by said center, and devices for turning and locking said arbors, substantially as described.

6. The combination of the support b', a base-piece to which said support is hinged, and devices for moving said support from a perpendicular to an inclined position and for holding it in such position, the centers c^2, carried thereby, the worm-wheels c^4, the worm c^5, the worm c^{12}, the indicator c^{11}, and dial c^{13}, carried by said movable support b', with the support b, hinged to a block or base-piece and movable from a perpendicular to an inclined position, and supporting one or more centers c, substantially as described.

7. The combination, in a work-holder, of the supports b b', carrying one or more centers c c^2, and the base-piece B, having the slots E E', with the block c, having the extension or foot c', and the intermediate block c^3, connected with the holder, and having slots corresponding to the slots E E', and the bolts or clamps connecting the holder with the bed of the milling-machine, substantially as described.

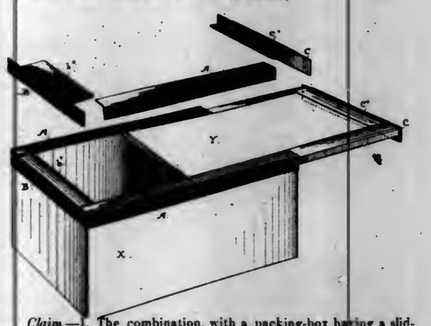


414,175. TREE-BOX. HARRY M. WHITTAKER, Beaver Falls, Pa., assignor of two-thirds to Edward P. Shellaberger, same place. Filed June 11, 1889. Serial No. 313,925. (No model.)

Claim.—1. The hereinbefore-described tree-box, comprising the vertical pickets, the encircling cables having their strands loosely twisted about the said pickets, and having hooks at their ends by which to fasten the cables together, the slotted anchoring-pins having the lowest cable passing through the slot in each pin, and the elastic loop-keepers D and D' for embracing the tree on opposite sides and expanding with the growth of the tree, substantially as set forth.

2. The combination, with the tree-box, of the slotted anchoring-pins having a portion of the box passing through the slot in each pin, whereby the box can be fastened to the ground and will be free to sway with the tree without doing injury thereto, substantially as described.

414,176. WASHING-MACHINE. ELI ZIMERMAN, Pamelia Four Corners, assignor to Charles E. Makepeace, Watertown, N. Y. Filed May 25, 1889. Serial No. 312,098. (No model.)



Claim.—1. In a washing-machine, the combination of a driving-shaft carrying a presser-roll and a cam, a spring pressure-bar arranged longitudinally above said shaft, a vibratory frame arranged below the presser roll on the driving-shaft and suspended from said pressure-bar, a pair of lower presser-rolls journaled in said vibratory frame, and a lever operated by the cam and connected to the vibratory frame to reciprocate the latter endwise, all arranged and combined for service, substantially as described, for the purpose set forth.

2. In a washing-machine, the combination of a removable frame adapted to be detachably secured to a wash-tub, a driving-shaft journaled in said removable frame and having an upper presser-roll and a grooved cam, a vibratory frame arranged below said upper roll and carrying a pair of spaced lower rolls, a lever pivoted on the removable frame and having a friction-roller which rides in the groove of the rotary cam, a connecting-arm secured to the vibratory frame and having a sliding connection with said lever, a longitudinal spring-bar suspended in the removable frame above the upper presser-roll, and vertical links intermediate of said spring-bar and the vibratory frame to suspend the latter, substantially as and for the purpose described.

3. In a washing-machine, the combination of a removable frame having the longitudinal rails adapted to be seated in notches in a wash-tub and detachably held in place thereon by suitable locking devices, substantially as described, a driving-shaft journaled in the removable frame, a longitudinal spring-bar connected to said removable frame by an adjusting-screw, a vibratory frame below said driving-shaft, the suspending-links intermediate of said spring-bar and the vibratory frame, the presser-rolls carried by said driving-shaft and vibratory frame, a cam fixed to the driving-shaft near one end, a lever operated by said cam and connected to the vibratory frame, a stationary perforated trough arranged longitudinally within the removable frame above the presser-rolls, and a depending pump suspended from the removable frame to communicate with said trough, and having its piston connected to a crank on the driving-shaft, whereby all the operating parts of the machine are carried by the removable frame, and the vibratory frame and pump are actuated from a common shaft, all arranged and combined substantially as herein shown and described, for the purpose set forth.

414,177. PACKING-BOX. WILLIAM H. SNOW, Oakland, Cal. Filed Feb. 18, 1889. Serial No. 300,372. (No model.)

Claim.—1. The combination, with a packing-box having a sliding cover and longitudinal angle-plates forming guides for said cover, of the angle-plate connected exteriorly to one end of said box and projecting inwardly over and at a distance from the edge of said box end, and provided with a spring-lip which is depressed below the plane of the upper side of the cover and upturned at its end above that plane to receive and clasp the cover, substantially as described.

2. In a packing-box, the combination of the body X, the sliding cover, the longitudinal angle-plates A A, attached to the outer sides thereof near the edge, so as to project inwardly over and at a distance from the edges to form guides for the sliding cover, and the angle-plate B, connected exteriorly to one end of said box and projecting inwardly over and at a distance from the edge of said box end, and provided with a spring-lip $b^\times$, which is depressed below the plane of the upper side of the cover and upturned at its end above that plane to receive and clasp the cover, substantially as described.

3. The combination of the packing-box, the sliding cover provided with the angle-plate C, whose member $c^\times$ is secured to the top edge of the cover, the longitudinal angle-plates A A, attached to the outer sides of the box near the edges, so as to project inwardly over the edges to form guides for the sliding cover, and the angle-plate B, connected exteriorly to one end of said box and projecting inwardly over and at a distance from the edge of said box end, and provided with a spring-lip $b^\times$, all substantially as described.

N. PETERS, Photo-Lithographer, Washington, D. C.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

OLIVER *v.* EVERITT.

Decided October 18, 1889.

1. INTERFERENCE—CONNECTION BETWEEN AN EARLIER APPLICATION DISCLOSING THE SUBJECT-MATTER CLAIMED IN A LATER APPLICATION INVOLVED IN INTERFERENCE FILED UNDER ANOTHER NAME.

Where it appeared that an earlier application disclosed the subject-matter claimed in a later application involved in interference, and the earlier application was filed in a name different from that under which the later application was filed, and the claim was made that both applications were by the same inventor, *Held* the only manner in which applicant could have the benefit of the earlier application was by way of testimony in the case.

2. SAME—BURDEN OF PROOF—RULE 116.

The object of ascertaining which of two contesting applicants first disclosed in a completed application the invention in controversy is to determine not only upon whom should rest the burden of proof under Rule 116, but also in whose favor a judgment may be rendered upon the record, in case the opposite party fail to file a preliminary statement or such statement fail to overcome the *prima facie* case made by the respective dates of application. (Rule 114.)

3. SAME—JUDGMENT ON THE RECORD.

An earlier application, in order to entitle a junior party to judgment on the record, must be upon its face an application in behalf of the same person who filed the application immediately in interference.

APPEAL on motion.

COMPLETING ELECTRIC CIRCUITS.

Application of William Samuel Oliver filed October 6, 1887, No. 251,650. Application of Percival Everitt filed February 2, 1887, No. 226,250.

Mr. James L. Norris for Oliver.
Messrs. J. J. Halsted & Son for Everitt.

MITCHELL, *Commissioner:*

When this case was last before the late Commissioner an opinion was rendered by him containing the following language:

Oliver will be permitted, however, to file a motion before the Examiner of Interferences that his prior application may be used as evidence, and the provisions of the rule (154, paragraph 7) that notice of such motion shall be given before the closing of the testimony will not be enforced against him.

When this motion shall be filed it is suggested that the Examiner of Interferences consult with the Primary Examiner upon the question as to whether the matter claimed in the application of Oliver involved in this interference was a part of the subject-matter involved in his application filed January 22, 1887, patented October 25, 1887. The burden of proof will then be adjusted in accordance with the final decision of this question.

Thereafter, in accordance with the foregoing instructions, the Examiner of Interferences admitted the previous application as evidence, but denied Oliver's motion to change the record date to the date of filing of such previous application—to wit, January 22, 1887—upon the ground that the application immediately in interference was not so connected with the earlier application as to entitle Oliver to the benefit of the earlier record date.

The Examiner of Interferences says:

In conformity with the instructions of the Commissioner the Examiner of Interferences has considered the question and consulted with the Primary Examiner as to whether the first-mentioned application is a division of the present one or discloses the subject-matter involved in the interference, and while it appears that the first-mentioned application discloses the subject-matter involved in the interference, there is nothing to show that the later application is a divisional one springing out of the former, and there is no evidence to show that the present applicant, William S. Oliver, is the same person as William Oliver, by whom the first application was filed.

It appears from the record that Oliver's pending application involved in this interference was filed October 6, 1887, in the name of William Samuel Oliver. The previous application was filed under the name of William Oliver on January 22, 1887, and discloses the subject-matter of the invention in the William Samuel Oliver application. This application of William Oliver was pending when the application of William Samuel Oliver was filed. Under dates of April 15 and 22, 1887, the Office required William Oliver to put his application in condition for a prospective interference. He thereupon amended his application, and on May 23, 1887, the examiner informed him that his application as then amended would probably not be involved in interference. On the 9th of June, 1887, William Oliver canceled that part of the specification and drawings filed January 22, 1887, which disclosed the subject-matter of the application of William Samuel Oliver. Thereafter an interference was declared between the William Samuel Oliver application and the application of Everitt, filed February 2, 1887. In declaring the interference William Samuel Oliver was made the junior applicant, the date of his application immediately in interference being later than that of Everitt.

It thus becomes apparent that, although the earlier application disclosed the invention in interference, it was filed by William Oliver instead of by William Samuel Oliver, and according to the opinion of the Examiner of Interferences "there is nothing to show that the later application is a divisional one springing out of the former." The Examiner of Interferences therefore denies the motion to change Oliver's record date, but allows him forty days from the final determination of this motion within which to take testimony to show that the present applicant, William Samuel Oliver, and William Oliver, by whom the application of January 22, 1887, was filed, are one and the same person. Everitt is also to be allowed sufficient time within

which to take testimony in rebuttal. As a reason for denying the motion to change the record date the Examiner of Interferences says:

> According to the established practice of the Office, for the purpose of giving an applicant in an interference proceeding the benefit of an earlier application date, there must be some connecting link in the later application by which it may be identified as a continuation or division of the former one, and unless the applications are so connected the original application may be used as evidence to show that the invention was made at the date thereof, but not for the purpose of establishing a *prima facie* date of invention prior to the date of the application involved in the interference.

The Examiner of Interferences cites authorities which he believes to support the conclusion which he reaches. I do not, however, deem it necessary in deciding the question at present under consideration to determine whether or not an express reference is required in the divisional application to the parent application, in order to establish the requisite connection, where, as in this case, it is found as a fact that the earlier application out of which the second application sprang does in fact disclose the controverted invention.

So far as this question is concerned the parties have had their day in court before the former Commissioner, and it was decided by him that the burden of proof should be determined by first ascertaining "whether the matter claimed in the application of Oliver involved in this interference was a part of the subject-matter disclosed in his application filed January 22, 1887."

The decision of the Examiner of Interferences must, however, be sustained upon another ground. The object of ascertaining which of two contesting applicants first disclosed in a completed application the invention in controversy is to determine not only upon whom should rest the burden of proof, under Rule 116, but also in whose favor a judgment may be rendered upon the record, in case the opposite party fail to file a preliminary statement or such statement fail to overcome the *prima facie* case made by the respective dates of application. (Rule 114.) Otherwise stated, the principal object is to ascertain who is entitled to have judgment upon the record in the entire absence of testimony.

It is clear that judgment could not be rendered in favor of William Samuel Oliver on inspection of a previous application of William Oliver, and it is equally clear, inasmuch as a judgment upon the record is a judgment in the absence of testimony, that evidence cannot be received to prove that the junior applicant has filed a previous application in another name in aid of such a judgment. Judgment upon the record follows directly upon inspection of the record. Testimony that persons bearing different names are one person in fact can only be presented as part of a body of proof intended to secure a judgment upon evidence. Without deciding, therefore, whether the connecting link of reference is necessary in a later application, otherwise divisional, in order to give the applicant the benefit of a parent application filed in the same name, I hold that an earlier application, in order to benefit a junior party, must be upon its face an application in behalf of the same person who filed the application immediately in interference, and that the only way in which an applicant can have the benefit of an earlier application which he claims to have been filed by himself, although in another name, is by way of testimony in the case.

The decision of the Examiner of Interferences is therefore affirmed.

EX PARTE TODD.

Decided October 21, 1889.

AMENDMENT MADE WITHIN TWO YEARS TO SAVE APPLICATION FROM ABANDONMENT—WHAT IS PROPER ACTION—REVISED STATUTES, SECTION 4894.

Where it appeared that on the last day upon which an application could be prosecuted without forfeiture under Revised Statutes, section 4894, amendments apparently of no considerable importance were offered, including one or two formal corrections in the claims which had been required by the examiner, and that such amendments were made in good faith for the purpose of prosecuting the application, *Held* that the action, so far as it went, was a proper action, and there was not such utter failure to prosecute within the two years as would warrant a judgment forfeiting rights.

ON PETITION.

COTTON-HARVESTERS.

Application of George N. Todd filed November 15, 1886, No. 218,853.

Messrs. Elliott & Omohundro for the applicant.

MITCHELL, *Commissioner:*

This is a proceeding to determine whether the application has become abandoned.

The examiner's statement contains the following presentation of facts:

> This application was filed November 15, 1886, and was first acted upon by the examiner on January 17, 1887. The objections raised by the examiner in this letter were of three classes: first, certain defects in the drawings were pointed out and additional illustration required; second, certain informalities in the specification and claims were indicated, and, third, a number of the claims were rejected on references.
>
> No action was taken by the applicant in response to that of the Office until January 17, 1889, the last day on which an amendment could be made under the statute. This amendment did not refer in any manner to any of the various objections of the first and third classes above mentioned, but merely changed two or three words in the claims, which change was not required and did not effect their merits, and also made one or two of the formal corrections required in the claims. This amendment of January 17, 1889, was followed on January 24, 1889, after the two years had expired, by another, which, if filed in time, would have been a proper amendment, but, being too late, could not be considered.
>
> On February 16, 1889, the applicant was informed that the amendment of January 17, 1889, was not a proper action within the rules to save the case from abandonment, and that as the amendment of January 24, 1889, was not filed until after the expiration of two years from the date of the last official action the case must be considered abandoned, and this action was repeated on September 25, 1889.

It appears from the communication of January 17, 1889, that amendments were tendered to eight different claims of the application as originally filed. These amendments are apparently not of considerable importance, but there is nothing to show that they were not made in good faith and for the purpose of prosecuting the application. That the intent was to prosecute the application in good faith is still further evidenced by the amendment of January 24, 1889, bearing date Chicago, Ill., January 19, which need not be critically consided, inasmuch as the examiner states that the later amendment, if filed in time, would have been a proper amendment entitled to consideration.

It is true that the somewhat informal action taken by the applicant does not conform in all respects to the requirements of the rules to entitle the applicant to reconsideration; but the question now involved is whether the amendment offered in good faith constituted, so far as it went, a proper action under the rules to prevent the application from being abandoned through utter failure to prosecute for more than two years. Both law and justice lean against forfeiture. Here was certainly an attempt to prosecute within the two years prescribed by statute, and the action, so far as it went, was a proper action, and it is conceded that one or two of the formal corrections in the claims had been required by the examiner.

I do not think I should be justified in holding that there is in this case such utter failure to prosecute within the two years as would warrant a judgment forfeiting rights.

The petition is granted.

EX PARTE HUNTER.

Decided October 23, 1889.

SUFFICIENCY OF AFFIDAVIT UNDER RULE 75.

Where an affidavit filed under Rule 75 showed that the applicant had conception of the invention prior to the dates of the references, but there was no complete reduction to practice until after said dates, and also stated that he had used "every diligence possible in putting the invention into use," without setting forth facts tending to show such diligence, *Held* not to be a sufficient compliance with the rule.

ON PETITION.

ELECTRICALLY-PROPELLED VEHICLES.

Application of Rudolph M. Hunter filed June 5, 1889, No. 313,217.

FISHER, *Acting Commissioner:*

The question involved in this petition is the sufficiency of an oath filed under Rule 75 to overcome the force of references, showing but not claiming the invention claimed by the petitioner. There is no controversy as to the fact that the invention claimed is disclosed in the references. The only question is whether the petitioner has set forth "facts showing a completion of the invention in this country before the filing of the application on which the domestic patent issued, or * * * before the date of the printed publication."

As to what facts are necessary to show completion of the invention within the meaning of Rule 75, the Office has ruled in *ex parte Gasser* (C. D., 1880, 94) and *ex parte Saunders*, (C. D., 1883, 23.)

In the Gasser case Mr. Commissioner Paine said:

> The applicant must state on oath facts showing either that a reduction to practice had been made before the filing of the application on which the patent was granted, or that the invention had been conceived before that time and by due diligence connected with a subsequent reduction to practice.

This interpretation of Rule 75 by Mr. Commissioner Paine is doubly valuable from the fact that the rule was made by him, and it is therefore to be presumed that he was fully advised as to its scope.

In the Saunders case Mr. Commissioner Marble cited the Gasser case with approval, and said:

> In any event I think that the applicant should be required at least to make a *prima facie* showing of an invention complete in a patentable sense before the date of the patent or publication. * * * He should show that he had before that time completed the invention and disclosed information of the same to others as full, accurate, and exact as that afforded by the patent or publication, and also that he has since preserved his right to a patent by a diligent prosecution of the same.

So far as I am able to discover these rulings have not been modified by any subsequent Commissioner and still govern the practice of the Office.

The question then to be determined is whether the affidavit submitted by the petitioner complies with the requirements thus laid down. It appears that he has been rejected upon references consisting of a publication bearing date 1887, and two patents, the applications for which were filed, respectively, July 30, 1887, and March 5, 1888. To overcome these dates the affidavit states that the invention was completed prior to the year 1884, and a photograph of a sketch is produced which is signed by the petitioner and several witnesses within dates running from January 24 to April 30, 1883. This sketch appears to disclose the invention in controversy, but so far as relates to the matters claimed is unaccompanied by any description. The affidavit also states that the invention thus shown was embodied in a car constructed in the year 1887, and that other cars embodying it were begun in the early spring of 1888 and have been used since September 4, 1888. It therefore appears, if it be conceded that the drawing discloses the invention, and of this there seems to be no doubt, that in 1883 petitioner had a conception of the invention, but that there was no complete reduction to practice of the same until after the dates of the references. The invention in controversy therefore cannot be said to have been completed before such reference dates. If the petitioner is entitled to his patent in the face of the disclosure of the references, it must therefore appear, as was stated by Mr. Commissioner Paine, that he has connected his prior conception by due diligence with his subsequent reduction to practice. Such diligence has not been shown. It is true that petitioner avers he has used "every diligence possible in putting the invention into use;" but a mere statement of this character unaccompanied by any facts which tend to show such diligence is not a sufficient compliance with the rule as interpreted by the Office. To this extent then the examiner is right in refusing to accept the affidavit as sufficient to overcome the force of the references. Petitioner, however, may be given such opportunity as he desires to complete the necessary showing.

The case is therefore returned to the Primary Examiner for action in accordance with this decision.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the District of Columbia.

MORRISON *et al. v.* THE CANTON SURGICAL AND DENTAL CHAIR COMPANY *et al.* No. 10,757. THE S. S. WHITE DENTAL MANUFACTURING COMPANY *v.* THE CANTON SURGICAL AND DENTAL CHAIR COMPANY *et al.* No. 10,758.

Decided September 23, 1889.

1. JURISDICTION OF SUPREME COURT OF THE DISTRICT OF COLUMBIA.

   Where a non-resident defendant corporation had appeared in a suit for infringement of Letters Patent, filed an answer, gone to proof, and submitted the case for final hearing, it was *Held* the court had jurisdiction to entertain the suit.

2. MORRISON—DENTAL CHAIRS—ANTICIPATION.

   Letters Patent No. 369,295, issued to James B. Morrison August 30, 1887, for improvement in dental chairs, not anticipated either by patent to one Bauder or to one Travis, in neither of which is there a platform for the foot such as patentee's chair

has, it being simply a slide below the bottom of the seat, upon which the leg may rest, in both cases, and the rest, when it is turned rearward, instead of being used as a rest for the foot, simply folds up flat with the body of the chair or platform, and therefore it does not serve the purpose of a rest at all.

3. SAME—INFRINGEMENT.

Said patent *Held* to be infringed by chair manufactured and offered for sale by the defendant, in which chair were to be found substantially the same contrivances as those of patentee's chair, with a slight difference simply as to the angle of elevation of the foot-rest when turned rearward.

4. WILKERSON—DENTAL CHAIRS—ANTICIPATION.

Letters Patent No. 197,441, issued to Basil M. Wilkerson November 20, 1877, for improvement in dental chairs, are not anticipated by the invention of Groff and Wilson, who invented improvements in a pneumatic pad for saddles and harness, which was an elastic pad, the object of which was to simply absorb moisture, while the patentee's pad was a stiff one to hold the head in place.

5. SAME—INFRINGEMENT.

Said patent *Held* to be infringed by defendant, who used the same device with the exception that, instead of using two of these devices in a series, as patentee did, one only is used, and in place of the other there is used an old contrivance. Said Letters Patent held also to be infringed by a chair in which the pad is exactly the same as that of patentee's chair.

6. INFRINGEMENT OF COMBINATION.

When the same thing is used in a series this should be considered as one entire thing and not a mere combination, and therefore the appropriation of any one of these things is an infringement of the whole.

7. NEWBROUGH—DENTAL CHAIRS—INFRINGEMENT.

Letters Patent No. 170,012, granted November 16, 1875, to John B. Newbrough, for improvement in dental chairs, *Held* not to be infringed by a device used by the defendant, which simply operates to regulate the tilt of the back of the chair and not to tilt the body of the chair, which was the object of patentee's invention, and where it appears that the tilting of the back of the chair in the complainant's case is made by a different apparatus entirely from that used by defendant.

The three patents sued under are: No. 369,295, to James B. Morrison, dated August 30, 1887; No. 197,441, to Basil M. Wilkerson, dated November 20, 1877, and No. 170,012, to John B. Newbrough, assignor to Samuel S. White, dated November 16, 1875.

Mr. Joseph C. Fraley and *Mr. Joseph K. McCammon* for the complainants.

Mr. Frankland Jannus for the defendants.

Mr. Justice COX delivered the opinion of the court.

I have had under consideration the case of Morrison and The S. S. White Dental Manufacturing Company against The Canton Surgical and Dental Chair Company and others and the case of The S. S. White Dental Manufacturing Company against the same. The substantial complaint is the same in both cases, claiming as assignee—that is, The S. S. White Dental Manufacturing Company. The suit is brought for an infringement of certain patents for improvements in dental chairs. The infringement alleged consists of offering 1 chair for sale, on the occasion of a dental convention in this city, which was said to embody patented improvements.

Both of these corporations are non-residents. At first a question arises as to the jurisdiction of this court to entertain the suit. Section 787 of the Revised Statutes relating to the District of Columbia provides:

No action or suit shall be brought in the supreme court by original process against any person who shall not be an inhabitant of or found within the District, except as otherwise specially provided.

Of course we know that at common law a corporation has no existence except in the jurisdiction where it was created. So that a non-resident corporation could neither be a resident nor be found within this District. According to common law, it could only be sued in the jurisdiction where it was created by service on its principal officer. The difficulty in entertaining jurisdiction is not as to the subject-matter. It is not because this court or any other court cannot entertain jurisdiction of a controversy in which a foreign corporation is a party; but the difficulty consists entirely in bringing the corporation within the reach of the process of the court.

There is a statute now found embodied in section 790 of the Revised Statutes, which provides that—

In actions against foreign corporations doing business in the District all process may be served on the agent of said corporation or person conducting its business, or, in case he is absent or cannot be found, by leaving a copy at the principal place of business in the District, and such service shall be effectual to bring the corporation before the court.

A doubt naturally arises as to the meaning of the term "doing business in the District." The only business done in this case was the sale or attempted sale of a single chair by this non-resident corporation, and the question would be whether that was doing business within the meaning of the statute, or whether the statute does not apply to an established permanent business, represented by permanent agents. I do not, however, think it necessary to resolve that doubt, because there can be no doubt that while service cannot be made upon a non-resident individual he could come within the District and submit himself to the jurisdiction of the court, and I do not see why a non-resident corporation cannot do the same thing. In this case the non-resident defendant has appeared in the case, filed an answer, gone to proof, and submitted the case for final hearing. Under these circumstances I do not think that any room remains for doubt as to the entertaining of the jurisdiction by this court.

The claim, then, is that the defendant has infringed 3 patents owned by the complainant as assignee, The S. S. White Dental Manufacturing Company. The first one is a patent issued to Morrison for improvements in dental chairs, and the claim allowed him, which is said to be infringed, is:

In combination with a chair-body having a platform or step attached thereto, a supplemental foot-rest, and arms to sustain said rest pivoted to the platform to swing forward and backward to a limited extent, and interlocking with said platform in an upright operative position when turned rearward as well as forward, whereby said arms are adapted to sustain the rest in either of two operative positions at different distances from the chair-seat.

I find in the chair manufactured by the defendant, which has been exhibited, substantially the same contrivances, with a slight difference simply as to the angle of elevation of the foot-rest when turned rearward; and the identity of the device for the purpose for which it is employed is made very plain by the fact that there are lugs placed upon the frame, which are, exactly as in the other, for the very purpose of preventing the rest from going down to a level with the platform and for the purpose of keeping it in position where it can operate as a foot-rest.

Two patents have been cited as anticipating the invention, one of Bauder and the other of Travis; but there are two differences between them and the present device. In these there is no platform for the foot. It is simply a slide below the bottom of the seat, upon which the leg may rest, in both cases, and in the next place, the rest, when it is turned rearward instead of being used as a rest for the foot, simply folds up flat with the body of the chair or platform, and therefore it does not serve the purpose of a rest at all. There has been discussion as to the meaning of the term "upright" in patentee's claim for the use of this rest in an "upright operating position." It is said that in the defendant's chair the rest, when turned rearward, is not upright, but more horizontal than otherwise. But the term "upright," it seems to me from the history of the application in the Patent Office, is simply used to distinguish this case from the two other cases I have already referred to, in which, when folded back, the rest was folded into the body of platform or went down immediately upon it and was not sufficiently elevated from it to be used at all. It is claimed on the part of the defendant that the word "upright" means vertical; but it never was intended that this rest should be used vertically in the device of the complainant. It means at an angle with a horizontal plane. I think it means upright in the sense of being elevated above the level of the platform and being susceptible of being used as a foot-rest. It seems to me, therefore, that an infringement exists in that case.

The next patent of which it is claimed there is an infringement is the patent issued to Wilkerson. There are 2 claims said to be infringed. The first claim is No. 24:

24. A head-rest support formed of links or sections united by conical or tapering pivots seated in correspondingly-shaped sockets capable of expanding and contracting, and bounded in part by movable blocks which transmit the movement from one cone and socket to the next, throughout the series, whereby its several joints will be tightened by the operation of a single device, substantially as set forth.

Now, the essential novelty in this case consists of this: The head-rest is fastened to a shank with a little ball at the end of it, and that ball rests in a socket, and this contrivance, the socket, is made in part by a sliding block, in grooves, concave at one end, so as to fit exactly upon the ball, so that when pressed upon the ball it will keep it in place; and at the other end of the sliding block there is a cone-shaped pivot which, when forced down, tightens the sliding block upon the ball, and thereby keeps this in its place. A simple movement of the lever-handle produces this result. By turning a screw on the pivot it draws it down into place and tightens the sliding block and the ball. The patentee, however, contemplates the use of more than one of these devices. He uses at least two, and he calls them a series. The two pivots are parallel to each other, and the tightening of one tightens the whole. It gives more range for play of the head-rest, as will be seen upon inspection. In fact, the more there are used the more it can be moved about. Now, it is substantially admitted in argument that this device of locking the ball with a sliding block and conical pivot is a novelty. But in the chair of the defendant this same device is used with this exception, viz., that instead of using 2 of these devices 1 only is used, and in place of the other there is what is called the "dummy-link" an old contrivance, and the lever or handle is between the two. The argument for the defendant is however that the complainant claims for a combination, and that it is not infringement of a combination patent to use one or more or any number less than the whole of the elements making up the combination, and that as the defendant only uses 1 of these contrivances instead of a series, two or more, as contemplated by the complainant or patentee, it is no infringement. I think, however, that the answer to that would be found in several authorities, to which I will call attention.

In Curtis on Patents, section 332, the law is said to be:

Where a patent is for a combination alone, it is no infringement to use any of the parts or things that go to make up the combination, provided the combination itself is not used. In a recent English case, however, it has been decided that a valid patent for an entire combination for a process gives protection to each part thereof that is new and material to that process, without any express claim of particular part, and notwithstanding that some parts of the combination are old.

In *Smith* v. *London and N. W. R. R.* the court said:

Where a patent is for the combination of two, three, or four old inventions a user of any one of them would not be an infringer of the patent; but where there is an invention consisting of several parts the imitation or pirating of any part of the invention is an infringement of the patent. Suppose that a man invents a machine consisting of three parts, of which one is a very useful invention and the two others are found to be of less practical use, surely it could not be said that it was free to any person to use the useful part so long as he took care to substitute some other mode of carrying out the less useful parts of the invention. We should be sorry to throw any doubt upon the question of an infringement of a material part of such an invention being an infringement upon which an action is sustainable by granting a rule to show cause upon such a point.

The same law is laid down in the case of *Sharp* v. *Tifft* (18 *Blatchf.*, 132) by Judge Wheeler in the following language:

Generally where a patent is for a combination of known parts, materials, or elements, it is not infringed by the use of any number of the parts, materials, or elements less than the whole, for the patent, in every such case is for that identical combination, and nothing else, and a combination of any less number of parts is a different thing. (*Prouty* v. *Ruggles*, 16 Pet., 336.) But where some of the parts of the combination are new, and those parts are taken and used in the same manner, but with different things from the rest of the combination patented, a part of the patented invention is taken, although the whole is not, and is an infringement to that extent. (*Sellers* v. *Dickinson*, 6 Eng. Law & Eq., 544; *Union Sugar Refining* v. *Matthiesen*, 2 Fish., 601.)

Besides this it does not seem to me that this rule about the use of less than the whole of a combination ought to apply to a case of this sort. What we understand by a combination ordinarily is the combination of things different in character, all working to the same result; but a series of the same identical things is quite a different matter. It might be illustrated in this way: Suppose a man invents a new form of link for a chain-cable, of course he expects that it will be used in a series to make up the cable; but it assuredly could not be said that anybody who employed it for every alternate link in his cable does not infringe that patent, or even if he employed one. When the same thing is used in a series, this should be considered as one entire thing and not a mere combination, and therefore the appropriation of any one of these things is an infringement of the whole. Therefore I think that the defense in this case fails to show that there is no infringement of this claim.

The 28th claim is:

28. A head-rest for a dental chair, consisting of a pair of pads connected by means of a slack strap, as set forth.

There are two fixed pads, and the object is that the side of the head and the back shall be sustained by these pads, while the connecting-strap on a different level does not interfere with the back hair of a lady who may be a patient. This is supposed to be anticipated by the invention of Groff and Wilson, who invented certain improvements in a pneumatic pad for saddles and harness.

Their patent states:

The object of our invention is to produce a cooling, anti-friction, and elastic cloth-pad for the double purpose of reducing the temperature and absorbing the moisture, the more effectually to prevent the galling or excoriation of horses by means of an elastic air-chamber in combination with a pocket or cushion stuffed with chamois leather.

What we claim as our invention, and desire to secure by Letters Patent, is—

An elastic pneumatic pad when combined of a hollow chamber A and pocket C and stuffed with chamois leather G, substantially as and for the purpose specified.

Now, that would not answer the object that is sought in this invention. An elastic pad which simply absorbs moisture there is not what is wanted here. This is a stiff pad to hold the head in place. There I find it an infringement in that respect, because it is hardly denied that the pads in both chairs are exactly the same.

The last patent said to be infringed is one issued to Newbrough. The object of the invention is expressed thus:

In order to regulate the rocking or tipping of the chair, I suspend it from the turning-frame D by means of uprights or arms E, on which the arms of the chair are pivoted, so as to allow the chair to rock on pivots *e*, which are at or above the center of gravity of the person occupying the chair, thus preventing the tendency to tip over.

To hold the chair at any desired inclination, a link or rack F, pivoted to the back of the chair, passes down through a hole in the rearwardly-projecting portion of the frame D, and is held at the desired point by a set-screw *f*, or its equivalent fastening.

The frame of the chair, as well as the foot-rest, may be made jointed or adjustable, if desired, in well-known ways.

The third claim is:

3. The combination of the supporting-frame, the horizontally-turning frame, the chair pivoted near the line of its arms to uprights on said turning-frame, and the adjustable link connecting the chair-back with the turning-frame, these members being constructed and operating substantially as set forth.

That is to say, in the first place, there is a frame at the bottom which supports the whole, and on that there is a round turning-frame, as seen in this frame here, (indicating a chair in the court-room,) and on the arms of that turning-frame the main chair is pivoted so as to balance.

The first weakness about this claim of the complainant is, however, that it seems to have abandoned this invention entirely. The claim is for a combination of certain elements. There are two of these important elements which are entirely omitted in the chairs manufactured for sale by the complainant. Instead of having a piece pivoted and suspended to the arms of the turning-frame, in this chair the turning-frame itself is the seat, and the device claimed, which is the bar, called a "link," pivoted to the back of the chair and fastened by running through the turning-frame, is wanting entirely. It was said in argument that three thousand of these chairs have been sold, and the trade circular of the complainant was also put in evidence. In none of the illustrations does this device appear at all. It seems, therefore, to have been practically abandoned and something entirely different substituted for it.

The device resorted to for tilting this chair is a spring arrangment in the seat itself, worked by a pedal and interlocking automatically, so as to keep the chair at any desired angle.

We find this in Curtis on Patents, section 237:

There is one case where it seems to have been held that an improved mode of working his machine by the patentee, different from the specification of his patent, casts upon him the burden of showing that he made the improvement subsequently to the issuing of his patent; otherwise it will be presumed that he did not disclose in his specification the best method known to him.

In this case it is very apparent that the device actually used for tilting this chair operates much better than the one described in this specification, and the one so described is not used. Of course that weakens the claim of the complainant to recover damages for the infringement of the invention described in his specification; but, besides that, it is apparent from the claim herein that the object of this link or bar is to tilt the whole chair. It says:

In order to regulate the rocking or tipping of the chair, I suspend it, &c.

The device used by the defendant has not that object at all. It is simply to tilt the back and regulate the angle of the back to the seat, which is an entirely different thing from tilting the whole chair. It is true that the patentee, Newbrough, says that the frame of the chair, as well as the foot-rest, may be made jointed or adjustable, if desired, in well-known ways. Therefore it is argued that this claim relates to a part of as well as to the whole of the chair; but it does not state in what manner it can be made jointed, and it is very apparent that if jointed like the defendant's chair the device would not operate at all for the object mentioned, which is to tilt the whole body of the chair. It would only tilt the back.

As further evidence that the tilting of the entire chair was contemplated, we find the fact that the tilting of the back of the chair in the complainant's case is made by a different apparatus entirely. The back is pivoted to the frame and is moved by different apparatus entirely from that which is described in the specification, which is evidence that the patentee did not contemplate the use of that contrivance for merely tilting the back of the chair, but for tilting the whole body of the chair.

Now, when we come to look at the contrivance of the defendant we find that it is not a straight bar at all like that described by the complainant. It is not pivoted to the back of the chair. It is pivoted at the side of the chair and at the bottom, and is a curved bar instead of a straight one. It works in certain respects differently from the invention described in the specification and performs an entirely different office. It simply operates to regulate the tilt of the back of the chair and not to tilt the body of the chair, which was the object of the patentee in his invention.

I therefore am not satisfied that any infringement is made out of the Newbrough patent. I think it is made out with reference to the other patents which I have already mentioned. That is all that it is necessary to say, and counsel can draw a decree accordingly.
